THOMSEN, GRÍMUR (1820–1896), Icelandic poet and man of letters, was born in 1820. He came in 1837 to the university of Copenhagen, where he first studied law and philology, but later, philosophy and aesthetics. He became an enthusiastic follower of the Pan-Scandinavian movement, although this was not generally favoured by his countrymen. After some years of foreign travel, in 1848 he entered the Danish diplomatic service, and remained in it till 1851, when he returned to Copenhagen, where he became the chief of one of the departments of the Danish foreign office. He retired in 1866, and then went back to Iceland, where he passed the rest of his life, active in the politics and the literature of his native island. He died in 1896. He is the best ballad poet Iceland has produced. His poems are unaffected and mostly free from rhetoric, the besetting sin of Icelandic poets. His subjects are principally taken from Icelandic or Scandinavian history and mythology. He is very unlike most of his contemporaries, both in style and thought: he is Icelandic to the core, and on that account is perhaps the modern Icelandic poet most appreciated by foreigners Besides his poems (two separate collections, Reykjavík, 1880, and Copenhagen, 1895), he is the author of numerous critical and historical essays in Icelandic and Danish, and some larger works in Danish, of which his dissertation on Lord Byron (Copenhagen, 1845) deserves to be mentioned. Grímur Thomsen was a warm admirer of Greek literature, and translated a great number of poems from that language into Icelandic. (S. Bl.)

THOMSEN, HANS PETER JÖRGEN JULIUS (1826–1909), Danish chemist, was born in Copenhagen on the 16th of February 1826, and spent his life in that city. From 1847 to 1856 he was engaged in teaching chemistry at the Polytechnic, of which from 1883 to 1892 he acted as director, and from 1856 to 1866 he was on the staff of the military high school. In 1866 he was appointed professor of chemistry at the university, and retained that chair until his retirement from active work in 1891. His name is famous for his researches in thermochemistry, and, especially between 1869 and 1882, he carried out a great number of determinations of the heat evolved or absorbed in chemical reactions, such as the formation of salts, oxidation and reduction, and the combustion of organic compounds. His collected results were published in 1882–1886 in four volumes under the title *Thermochemische Untersuchungen*, and also a *résumé* in English under the title *Thermochemistry* in 1908. In 1857 he established in Copenhagen a process for manufacturing soda from cryolite, obtained from the west coast of Greenland. He died on the 13th of February 1909. His brother, Carl August Thomsen (1834–1894), was lecturer on technical chemistry at the Copenhagen Polytechnic, and a second brother, Thomas Gottfried Thomsen (1841–1901), was assistant in the chemical laboratory at the university till 1884, when he abandoned science for theology, subsequently becoming minister at Norup and Randers.

THOMSON, SIR CHARLES WYVILLE (1830–1882), Scottish naturalist, was born at Bonsyde, Linlithgowshire, on the 5th of March 1830, and was educated at Edinburgh University. In 1850 he was appointed lecturer in, and in 1851 professor of, botany at Aberdeen, and in 1853 he became professor of natural history in Queen's College, Cork. A year later he was nominated to the chair of mineralogy and geology at Queen's College, Belfast, and in 1860 was transferred to the chair of natural history in the same institution. In 1868 he assumed the duties of professor of botany at the Royal College of Science, Dublin, and finally in 1870 he received the natural history chair at Edinburgh. He will be specially remembered as a student of the biological conditions of the depths of the sea. Being interested in crinoids, and stimulated by the results of the dredgings of Michael Sars (1805–1869) in the deep sea off the Norwegian coasts, he succeeded, along with Dr W. B. Carpenter, in obtaining the loan of H.M.S. "Lightning" and "Porcupine," for successive deep-sea dredging expeditions in the summers of 1868 and 1869. It was thus shown that animal life exists in abundance down to depths of 650 fathoms, that all invertebrate groups are represented (largely by Tertiary forms previously believed to be extinct), and, moreover, that deep-sea temperatures are by no means so constant as was supposed, but vary considerably, and indicate an oceanic circulation. The results of these expeditions were described in *The Depths of the Sea*, which he published in 1873. The remarkable results gained for hydrography as well as zoology, in association with the practical needs of ocean telegraphy, soon led to the granting of H.M.S. "Challenger" for a circumnavigating expedition, and Thomson sailed at the end of 1872 as director of the scientific staff, the cruise lasting three years and a half (see Challenger Expedition). On his return he received many academic honours, and was knighted. In 1877 he published two volumes (*The Voyage of the Challenger in the Atlantic*), of a preliminary account of the results of the voyage, meanwhile carrying on his administrative labours in connexion with the disposition of the special collections and the publication of the monographs dealing with them. His health, never robust, was meanwhile giving way; from 1879 he ceased to perform the duties of his chair, and he died at Bonsyde on the 10th of March 1882.

See obituary notice in *Proc. Soc. Edin.* (1883); also Thomson and Murray, *Reports of the Voyage of H.M.S. "Challenger"* (Edinburgh, 1885).

THOMSON, JAMES (1700–1748), English poet, author of *The Seasons*, was born at Ednam, in Roxburghshire, on the 11th of September 1700—the third son and fourth child of Thomas Thomson, minister of that place. His mother, Beatrix, was the daughter of Mr Trotter of Fogo, whose wife, Margaret, was one of the Homes of Bassenden. About 1701 Thomas Thomson removed to Southdean near Jedburgh. Here James was educated at first by Robert Riccaltoun, to whose verses on

Winter he owed the suggestion of his own poem. In 1712 he attended a school at Jedburgh, held in the aisle of the parish church. He learnt there some Latin, but with difficulty, and the earliest recorded utterance of the future poet was "Confound the building of Babel." He began very soon to write verses, and we are told that every January he destroyed almost all the productions of the preceding year. And this was just as well, for the little that has escaped the fire contains no promise of his future powers. In 1715 he went to the university of Edinburgh. It is said that as soon as the servant who brought him thither had quitted him, he returned full speed to his father's house, declaring that he could read just as well at home; he went back, however, and had not been long at college before he lost his father, who died, according to one remarkable but highly improbable story, in the attempt to lay a ghost. The incident should have left more impression than we can trace upon the mind of the poet, at this date nervous and afraid of the dark; but in his *Winter* he writes of all such stories with a quiet contempt for "superstitious horror." He made friends at the university with David Mallock, who afterwards called himself Mallet, and with Patrick Murdoch, his future biographer. In 1719 he became a divinity student, and one of his exercises so enchanted a certain Auditor Benson, that he urged Thomson to go to London and there make himself a reputation as a preacher. It was partly with this object that Thomson left Edinburgh without a degree in March 1725. His mother saw him embark, and they never met again; she died on the 10th of May of that year. There is sufficient evidence that on his arrival in London he was not in the extreme destitution which Dr Johnson attributes to him; and in July 1725 we find him engaged, as a make-shift, in teaching "Lord Binning's son to read." This son was the grandson of Lady Grizel Baillie, a somewhat distant connexion of Thomson's mother. She was the daughter of Sir Patrick Home, whom, after the defeat of Argyll, she fed in his concealment near his own castle; she was also, like other Scottish ladies, a writer of pretty ballads. This heroine and poetess is supposed to have encouraged Thomson to come to England, and it is certain that she procured him a temporary home. But he had other friends, especially Duncan Forbes of Culloden, by whom he was recommended to the duke of Argyll, the earl of Burlington, Sir Robert Walpole, Arbuthnot, Pope and Gay. Some introductions to the literary world he may have owed to Mallet, then tutor in the family of the duke of Montrose.

Thomson's *Winter* appeared in March 1726. It was warmly praised by Aaron Hill, a man of various interests and projects, and in his day a sort of literary oracle. It was dedicated to Sir Spencer Compton, the Speaker, who rewarded the poet, to his great disgust, with a bare twenty guineas. By the 11th of June 1727 a second edition was called for. Meanwhile Thomson was residing at Mr Watts's academy in Tower Street as tutor to Lord George Graham, second son of the duke of Montrose, and previously a pupil of Mallet. *Summer* appeared in 1727. It was dedicated in prose, a compliment afterwards versified, to Bubb Dodington. In the same year Thomson published his *Poem to the Memory of Sir Isaac Newton*, with a fulsome dedication to Sir Robert Walpole, which was afterwards omitted, and the verses themselves remodelled when the poet began to inveigh against the ministry as he did in *Britannia*, published in 1729. *Spring* appeared in 1728, published by Andrew Millar, a man who, according to Johnson, dealt handsomely by authors and "raised the price of literature." It was dedicated to the countess of Hertford, afterwards duchess of Somerset, a lady devoted to letters and the patroness of the unhappy Savage. In 1729 Thomson produced *Sophonisba*, a tragedy now only remembered by the line "O Sophonisba, Sophonisba, O," and the parody "O Jemmy Thomson, Jemmy Thomson, O," which caused him to remodel the unhappy verse in the form, "O Sophonisba, I am wholly thine." A poem, anonymous but unquestionably Thomson's, to the memory of Congreve who had died in January 1729, appeared in that year. In 1730 *Autumn* was first published in a collected edition of *The Seasons*. It was dedicated to the Speaker, Onslow. In this year, at the suggestion of Rundle, bishop of Derry, one of his patrons, he accompanied the son of Sir Charles Talbot, solicitor-general, upon his travels. In the course of these he projected his *Liberty* as "a poetical landscape of countries, mixed with moral observations on their government and people." In December 1731 he returned with his pupil to London. He probably lived with his patrons the Talbots, leisurely meditating his new poem, the first part of which did not appear until the close of 1734 or the beginning of 1735. But meanwhile his pupil died, and in the opening lines of *Liberty* Thomson pays a tribute to his memory. Two months after his son's death Sir Charles Talbot became chancellor and gave Thomson a sinecure in the court of chancery. About this time the poet worked for the relief of Dennis, now old and in extreme poverty, and induced even Pope to give a half-contemptuous support to the bitter critic of the *Rape of the Lock*. *Liberty* was completed in five parts in 1736. The poem was a failure; its execution did not correspond with its design; in a sense indeed it is a survey of countries and might have anticipated Goldsmith's *Traveller*. It was not, however, the poem which readers were expecting from the author of *The Seasons*, who had taken them from the town to the country, and from social and political satire to the world of nature. It is in the main a set of wearisome declamations put in the mouth of the goddess, and Johnson rightly enough remarks that "an enumeration of examples to prove a position which nobody denied as it was from the beginning superfluous, must quickly grow disgusting." The truth is that Thomson's poetical gift was for many years perverted by the zeal of partisanship.

He was established in May 1736 in a small house at Richmond, but his patron died in February 1737 and he lost his sinecure; he then "whips and spurs" to finish his tragedy *Agamemnon*, which appeared in April 1738, not before he had been arrested for a debt of £70, from which, according to a story which has been discredited on quite insufficient grounds, Quin relieved him in the most generous and tactful manner. Quin, it is said, visited him in the sponging-house and "balanced accounts with him" by insisting on his accepting a hundred pounds as a return for the pleasure which the actor had received from the poet's works. The incident took place probably a little before the production of *Agamemnon*, in which Quin played the leading part. The play is of course modelled upon Aeschylus and owes whatever of dignity it possesses to that fact; the part of Cassandra, for instance, retains something of its original force, pathos and terror. But most of the other characters exist only for the purpose of political innuendo. Agamemnon is too long absent at Troy, as George is too long absent in Germany; the arts of Aegisthus are the arts of Walpole; the declamations of Arcus are the declamations of Wyndham or Pulteney; Melisander, consoling himself with the muses on his island in Cyclades, is Bolingbroke in exile. Thomson about this time was introduced to Lyttelton, and by him to the prince of Wales, and to one or the other of these, when he was questioned as to the state of his affairs, he made answer that they were "in a more poetical posture than formerly." *Agamemnon* was put upon the stage soon after the passing of Walpole's bill for licensing plays, and its obvious bias fixed the attention of the censorship and caused Thomson's next venture, *Edward and Eleanora*, which has the same covert aim, to be proscribed. The fact has very generally escaped notice that, like its predecessor, it follows a Greek original, the *Alcestis* of Euripides. It has also, what *Agamemnon* has not, some little place in the history of literature, for it suggested something to Lessing for *Nathan der Weise*, and to Scott for the *Talisman*. The rejection of the play was defended by one of the ministry on the ground that Thomson had taken a *Liberty* which was not agreeable to *Britannia* in any *Season*. These circumstances sufficiently account for the poet's next experiment, a preface to Milton's *Areopagitica*. He joined Mallet in composing the masque of *Alfred*, represented at Clieveden on the Thames before the prince of Wales, on the 1st of August 1740. There can be little question that "Rule

Britannia," a song in this drama, was the production of Thomson. The music of the song, as of the whole masque, was composed by Arne. In 1744 Thomson was appointed surveyor-general of the Leeward Islands by Lyttelton with an income of £300 a year; but his patron fell into disfavour with the prince of Wales, and in consequence Thomson lost, at the close of 1747, the pension he received from that quarter. For a while, however, he was in flourishing circumstances, and whilst completing at his leisure *The Castle of Indolence* produced *Tancred and Sigismunda* at Drury Lane in 1745. The story is found in *Gil Blas*, and is ultimately to be traced to *The Decameron*. It owes much to Le Sage in language, plot and sentiment, and the conflict of emotion, in depicting which Thomson had some little skill, is here effectively exhibited. He was assisted herein by his own experience. The "Amanda" of *The Seasons* is a Miss Elizabeth Young, a lady of Scottish parentage, whose mother was ambitious for her and forbade her to marry the poet, anticipating that she would be reduced to singing his ballads in the streets. The last years of his life were saddened by this disappointment.

The Castle of Indolence, after a gestation of fifteen years, appeared in May 1748. It is in the Spenserian stanza with the Spenserian archaism, and is the first and last long effort of Thomson in rhyme. It is not impossible that his general choice of blank verse was partly due to the fact that he had not the southron's ear and took many years to acquire it. The great and varied interest of the poem might well rescue it from the neglect into which even *The Seasons* has fallen. It was worthy of an age which was fertile in character-sketches, and like Gay's *Welcome to Pope* anticipates Goldsmith's *Retaliation* in the lifelike presentation of a noteworthy circle. There is in it the same strain of gentle burlesque which appears in Shenstone's *Schoolmistress*, whilst the tone and diction of the poem harmonize with the hazy landscape, the pleasant land of drowsyhead, in which it is set. It is the last work by Thomson which appeared in his lifetime. In walking from London to his house at Richmond he became heated and took a boat at Hammersmith; he thus caught a chill with fatal consequences and died on the 27th of August 1748. He was buried in Richmond churchyard. His tragedy *Coriolanus* was acted for the first time in January 1749. In itself a feeble performance, it is noteworthy for the prologue which his friend Lyttelton wrote for it, two lines of which—

> "He loved his friends—forgive the gushing tear!
> Alas! I feel I am no actor here"—

were recited by Quin with no simulated emotion.

It may be questioned whether Thomson himself ever quite realized the distinctive significance of his own achievement in *The Seasons*, or the place which criticism assigns him as the pioneer of a special literary movement and the precursor of Cowper and Wordsworth. His avowed preference was for great and worthy themes of which the world of nature was but one. Both the choice and the treatment of his next great subject, *Liberty*, indicate that he was imperfectly conscious of the gift that was in him, and might have neglected it but that his readers were wiser than himself. He has many audacities and many felicities of expression, and enriched the vocabulary even of the poets who have disparaged him. Yet it is difficult to believe that he was not the better for that training in refinement of style which he partly owed to Pope, who almost unquestionably contributed some passages to *The Seasons*. And, except in *The Castle of Indolence*, there is much that is conventional, much that is even vicious or vulgar in taste when Thomson's muse deals with that human life which must be the background of descriptive as of all other poetry; for example, his bumpkin who chases the rainbow is as unreal a being as Akenside's more sentimental rustic who has "the form of beauty smiling at his heart." But if Thomson sometimes lacks the true vision for things human, he retains it always for things mute and material, and whilst the critical estimate of his powers and influence will vary from age to age, all who have read him will concur in the colloquial judgment which only candour could have extorted from the prejudice of Dr Johnson—"Thomson had as much of the poet about him as most writers. Everything appeared to him through the medium of his favourite pursuit. He could not have viewed those two candles burning but with a poetical eye."

For the day of Thomson's birth see the Aldine edition of his poems (1897). In the same volume (pp. 189 seq.) is discussed the question of Pope's contributions to *The Seasons*. These Pope, if the handwriting be his, made in an interleaved edition of *The Seasons* dated 1738, and they were for the most part adopted by Thomson in the edition of 1744. The writer seldom makes more than verbal changes in passages of pure description, but sometimes strikingly enhances the scenes in which human character comes into play, adding, for example, the comparison, in *Autumn*, of the fair Lavinia to a myrtle in the Apennines, of which the first suggestion can be found in *The Rape of the Lock*. But whereas many years ago the opinion of experts at the British Museum pronounced the handwriting of these notes to be Pope's beyond a doubt, their successors at the present day are equally positive that it is not. Some account should be taken of the cramping of the hand, due to writing on a curved surface, and of the letters at Blenheim (see *Pall Mall Magazine* for August 1894), which bear a greater resemblance to the disputed handwriting than any specimens in the British Museum.

The first collected editions of *The Seasons* bear dates 1730, 1738, 1744, 1746. Lyttelton tampered both with *The Seasons* and with *Liberty* in editions after his friend's death. Among the numerous lives of the poet may be mentioned those by his friend Patrick Murdoch, by Dr Johnson in *Lives of the Poets*, by Sir Harris Nicolas (Ald. ed., 1860), by M. Morel, *James Thomson, sa vie et ses œuvres* (Paris, 1895), and *James Thomson*, in the English Men of Letters Series, by G. C. Macaulay (1908). See also Dr G. Schmeding's *Jacob Thomson, ein vergessener Dichter des achtzehnten Jahrhunderts*; the life prefixed to the Aldine edition of his works in 1897; and an excellent edition of *The Seasons* in the Clarendon Press Series by J. Logie Robertson. (D. C. To.)

THOMSON, JAMES (1834–1882), British poet, best known by his signature "B.V.", was born at Port-Glasgow, in Renfrewshire, on the 23rd of November 1834, the eldest child of a mate in the merchant shipping service. His mother was a deeply religious woman of the Irvingite sect. On her death, James, then in his seventh year, was procured admission into the Caledonian Orphan Asylum. In 1850 he entered the model school of the Military Asylum, Chelsea, from which he went out into the world as an assistant army schoolmaster. At the garrison at Ballincollig, near Cork, he encountered the one brief happiness of his life: he fell passionately in love with, and was in turn as ardently loved by, the daughter of the armourer-sergeant of a regiment in the garrison, a girl of very exceptional beauty and cultivated mind. Two years later he suddenly received news of her fatal illness and death. The blow prostrated him in mind and body. Henceforth his life was one of gloom, disappointment, misery and poverty, rarely alleviated by episodes of somewhat brighter fortune. While in Ireland he had made the acquaintance of Charles Bradlaugh, then a soldier stationed at Ballincollig, and it was under his auspices (as editor of the *London Investigator*) that Thomson first appealed to the public as an author, though actually his earliest publication was in *Tait's Edinburgh Magazine* for July 1858, under the signature "Crepusculus." In 1860 was established the paper with which Bradlaugh was so long identified, the *National Reformer*, and it was here, among other productions by James Thomson, that appeared (1863) the powerful and sonorous verses "To our Ladies of Death," and (1874) his chief work, the sombre and imaginative *City of Dreadful Night*. In October 1862 Thomson was dismissed the army, in company with other teachers, for some slight breach of discipline. Through Bradlaugh, with whom for some subsequent years he lived, he gained employment as a solicitor's clerk. From 1866 to the end of his life, except for two short absences from England, Thomson lived in a single room, first in Pimlico and then in Bloomsbury. He contracted habits of intemperance, aggravated by his pessimistic turn of mind to dipsomania, which made a successful career impossible for him. In 1869 he enjoyed what has been described as his "only reputable appearance in respectable literary society," in the acceptance of his long poem, "Sunday up the River," for *Fraser's Magazine*, on the advice, it is said, of Charles Kingsley.

In 1872 Thomson went to the western states of America, as the agent of the shareholders in what he ascertained to be a fraudulent silver mine; and the following year he received a commission from the *New York World* to go to Spain as its special correspondent with the Carlists. During the two months of his stay in that distracted country he saw little real fighting, and was himself prostrated by a sunstroke. On his return to England he continued to write in the *Secularist* and the *National Reformer*, under the initials "B.V."[1] In 1875 he severed his connexion with the *National Reformer*, owing to a disagreement with its editor; henceforth his chief source of income (1875–1881) was from the monthly periodical known as *Cope's Tobacco Plant*. Chiefly through the exertions of his friend and admirer, Bertram Dobell, Thomson's best-known book, *The City of Dreadful Night, and other Poems*, was published in April 1880, and at once attracted wide attention; it was succeeded in the autumn by *Vane's Story, and other Poems*, and in the following year by *Essays and Phantasies*. All his best work was produced between 1855 and 1875 ("The Doom of a City," 1857; "Our Ladies of Death," 1861; *Weddah and Om-el-Bonain*; "The Naked Goddess," 1866–1867; *The City of Dreadful Night*, 1870–1874). He died at University College Hospital, in Gower Street, on the 3rd of June 1882, and was buried at Highgate cemetery, in the same grave, in unconsecrated ground. as his friend Austin Holyoake.

To the productions of James Thomson already mentioned may be added the posthumous volume entitled *A Voice from the Nile, and other Poems* (1884), to which was prefixed a memoir by Bertram Dobell. This volume contained much that is interesting, but nothing to increase Thomson's reputation. If an attempt be made to point to the most apparent literary relationship of the author of *The City of Dreadful Night*, one might venture the suggestion that James Thomson was a younger brother of De Quincey. If he has distinct affinity to any writer it is to the author of *Suspiria de profundis*; if we look further afield, we might perhaps discern shadowy prototypes in Leopardi, Heine and Baudelaire. But, after all, Thomson holds so unique a place as a poet that the effort at classification may well be dispensed with. His was no literary pessimism, no assumed gloom. The poem "Insomnia" is a distinct chapter of biography; and in "Mater Tenebrarum" and elsewhere among his writings passages of self-revelation are frequent. The merits of Thomson's poetry are its imaginative power, its sombre intensity, its sonorous music; to these characteristics may be added, in his lighter pieces, a Heine-like admixture of strange gaiety, pathos and caustic irony. Much the same may be said of his best prose. His faults are a monotony of epithet, the not infrequent use of mere rhetoric and verbiage, and perhaps a prevailing lack of the sense of form; besides an occasional vulgar recklessness of expression, as in parts of *Vane's Story* and in some of his prose writings.

See the *Life*, by H. S. Salt (1905 edition).

THOMSON, JAMES (1822–1892), British physicist and engineer, was born in Belfast on the 16th of February 1822, and, like his younger brother, Lord Kelvin, at an unusually early age began to attend the classes at Glasgow University, where his father had been appointed professor of mathematics in 1832. After his graduation he decided to study civil engineering, and for that purpose became a pupil in several engineering offices and works successively; but ill-health obliged him to leave them all, and he had finally to accept the fact that an occupation involving physical exertion was out of the question. Accordingly, from about 1843, he devoted himself to theoretical work and to mechanical invention. To this period belong his well-known researches in thermodynamics, which enabled him to predict by the application of Carnot's theorem that the temperature of the freezing point of substances which expand on solidifying must be lowered by the application of pressure, the reverse being the case with substances which contract on solidification; and he was able to calculate the amount by which a given pressure lowers the freezing-point of water, a substance which expands on solidification. His results were experimentally verified in the physical laboratories of Glasgow University under Lord Kelvin's direction, and were afterwards applied to give the explanation of regelation. In 1861 he extended them in a paper on crystallization and liquefaction as influenced by stresses tending to change of form in the crystals, and in other studies on the change of state he continued Thomas Andrews's work on the continuity of the liquid and gaseous states of matter, constructing a thermodynamic model in three dimensions to show the relations of pressure, volume and temperature for a substance like carbonic acid. With regard to his inventions, he devised a clever feathering mechanism for the paddles of steamboats when only a boy of sixteen, and later turned his attention to water engines. In 1850 he patented his "vortex water-wheel," and during the next three or four years carried on inquiries into the properties of "whirling fluids," which resulted in improved forms of blowing-fans and water-turbines (see HYDRAULICS). Settling in Belfast in 1851, he was selected to be the resident engineer to the Belfast Water Commissioners in 1853, and four years later became professor of civil engineering and surveying in Queen's College, Belfast. Thence he removed in 1873 to Glasgow as successor to Macquorn Rankine in the chair of engineering in the university, and retained this position until 1889, when the failure of his eyesight compelled him to resign. He died on the 8th of May 1892 at Glasgow. His contributions to geological science included studies of the parallel roads of Glen Roy and of the prismatic jointing of basalt, as seen at the Giant's Causeway. In 1876 and following years he studied the origin of windings of rivers in alluvial plains and made many experiments with the aid of artificial streams; and the currents of atmospheric circulation afforded him the material for the Bakerian lecture of 1892.

THOMSON, JOHN (1778–1840), Scottish landscape painter—Thomson of Duddingston, as he is commonly styled—was born on the 1st of September 1778 at Dailly, Ayrshire. His father, grandfather and great-grandfather were clergymen of the Church of Scotland. He studied for the same vocation in the university of Edinburgh; and, residing with his elder brother, Thomas Thomson, afterwards celebrated as an antiquarian and feudal lawyer, he made the acquaintance of Francis Jeffrey and other young members of the Scottish bar afterwards notable. During the recess he sketched in the country, and, while attending his final college session, he studied art for a month under Alexander Nasmyth. After his father's death he became, in 1800, his successor as minister of Dailly; and in 1805 he was translated to the parish of Duddingston, close to Edinburgh. He continued, however, to practise art as an amateur, apparently without any detriment to his pastoral duties. Thomson's popularity as a painter increased with his increasing artistic skill; and, having mastered his initial scruples against receiving artistic fees, on being offered £15 for a landscape—reassured by "Grecian" Williams's stout assertion that the work was "worth thrice the amount"—the minister of Duddingston began to dispose of the productions of his brush in the usual manner. In 1830 he was made an honorary member of the Royal Scottish Academy. Thomson was also an accomplished performer on violin and flute, an exact and well-read student of physical science, and one of the writers on optics in the early numbers of the *Edinburgh Review*. He enjoyed a singularly wide and eminent circle of friends, including, among artists, Turner and Wilkie, and among men of letters, Wilson and Scott—the latter of whom desired that Thomson, instead of Turner, should have illustrated the collected edition of his works. He died at Duddingston on the 27th of October 1840 (not the 20th, as stated by some authorities). Thomson was twice married, and his second wife, the widow of Mr Dalrymple of Cleland, was herself also a skilful amateur artist.

Thomson is fairly represented in the Scottish National Gallery; and the "Aberlady Bay" of that collection, with the soft infinity of

[1] Bysshe Vanolis: "Bysshe," as the commonly used Christian name of Shelley, Thomson's favourite writer; and "Vanolis," an anagram of Novalis—(F. von Hardenberg).

its clouded grey sky, and its sea which leaps and falls again in waves of sparkling and of shadowed silver, is fit to rank among the triumphs of Scottish art.

THOMSON, JOSEPH (1858–1895), Scottish explorer in Africa, was born on the 14th of February 1858 at Penpont, Dumfriesshire, being the fifth son of William Thomson, originally a working stonemason, who had attained the position of a master builder. In 1868 his father removed to Gatelawbridge, where he rented a farm and a quarry. Joseph Thomson was soon attracted by the geological formation and historical associations of Nithsdale. For a short time he worked in his father's quarry. In 1875 he went to Edinburgh University, where he paid particular attention to geology and botany, and after completing his course in 1878 he was appointed geologist and naturalist to the Royal Geographical Society's expedition to East Central Africa under Keith Johnston. The latter died at Behobeho, between the coast and the north end of Lake Nyasa, on the 28th of June 1879, and Thomson then took command. Though only twenty-one his coolness and tact were remarkable, and he successfully conducted the expedition across the desolate region of Uhehè and Ubena to the north end of Lake Nyasa, and then by a hitherto unexplored track to Lake Tanganyika, where he investigated the moot question of the Lukuga outlet. From Tanganyika he started to reach the Congo, but troubles with his carriers, who dreaded the warlike Warua, obliged him to retrace his steps. Going round the south end of Tanganyika he discovered Lake Rukwa, whence he marched via Tabora to the coast at Bagamoyo, reaching London in August 1880. In the following year he published an account of his travels under the title *To the Central African Lakes and Back*. About this time the sultan of Zanzibar, being anxious to develop certain supposed coal beds on the river Rovuma, was advised to obtain independent expert opinion as to their value. Application was made to Thomson, who undertook to survey them, and started from Mikindani, on the 17th of July 1881. The coal, however, turned out to be merely bituminous shale, and Thomson, on his return to Zanzibar, had to endure much delay and vexation through the sultan's chagrin. For a considerable time the explorer had directed his attention to Masailand, a region of East Africa occupied by a powerful tribe of warriors who had a reputation for savagery and intractability somewhat greater than their actions warranted. Through their territory ran the shortest route from the sea to the headwaters of the Nile. In 1882 the Royal Geographical Society took up the question, and requested Thomson to report on the practicability of taking a caravan through the Masai country, which no European had yet been able to penetrate beyond Mt Kilimanjaro. By undaunted courage and great resourcefulness he succeeded in crossing the Njiri desert and exploring the eastern rift-valley. Thence he went with a picked company through Laikipia to Mt Kenya and Lake Baringo, afterwards traversing the unknown region lying between Baringo and Victoria Nyanza, reached on the 10th of December 1883. On his way back he visited Mt Elgon and discovered there a series of wonderful caves. The account of this adventurous journey appeared in 1884, under the title of *Through Masăiland*, and it is a classic in modern travel. The hardships and anxieties attendant on such a career began to tell upon Thomson's exceptionally hardy constitution, but in 1885 he undertook an expedition to Sokoto for the National African (afterwards the Royal Niger) Company, and succeeded in obtaining the signatures of the sultans of Sokoto and Gando to treaties with which he had been entrusted by the company, treaties which did much to secure British interests in Nigeria. In 1888, by way of recreation, he travelled through southern Morocco and explored a portion of the Atlas range, and published the results in the following year, under the title *Travels in the Atlas and Southern Morocco*. In 1890 he entered the service of the British South Africa Company and in that and the following year, starting from Quilimane he traversed the region between lakes Nyasa and Bangweulu and the Zambezi. It was a period of great tension between the Portuguese and the British, and Thomson's party on leaving the Portuguese frontier was fired on by the Portuguese who, too late, realized that they had allowed a treaty-making envoy to pass through their territory in the guise of a peaceful trader. Thomson concluded treaties with native potentates which gave to the Chartered Company political, trading and mining rights over a large part of the district since known as North-East Rhodesia. This journey, in which he covered nearly a thousand miles of hitherto unexplored country, proved disastrous to a constitution already undermined. In 1893 he visited South Africa in search of health, but unavailingly. He died in London on the 2nd of August 1895. The accounts of his travels not recorded in the books mentioned were published in magazines or in the *Proceedings of the Royal Geographical Society*. Thomson was the last, as he was one of the most successful, of the great geographical pioneers in Africa. He had an extraordinarily keen topographical instinct which enabled him to comprehend at a glance the natural features of the countries he traversed. To undaunted courage and promptness of decision he added a forbearing and patient disposition. "Joseph. Thomson," wrote Sir Clements Markham, "had the high and glorious distinction of never having caused the death of a native. This is a proof of very rare qualities in the leader of an expedition, and places him in the very first rank of explorers."

Besides the accounts of his own travels Thomson wrote, in collaboration with Miss E. Harris Smith, *Ulu* (London, 1888), a novel based on his insight into the working of the African mind, *Mungo Park and the Niger* (London, 1890), a sound critical biography and many magazine articles on African politics.

See *Joseph Thomson, African Explorer* (London, 1896), a biography by his brother, the Rev. J. B. Thomson, which contains a list of the published writings of the explorer.

THOMSON, THOMAS (1773–1852), Scottish chemist, was born at Crieff, Perthshire, on the 12th of April 1773. He was educated at the universities of St Andrews and Edinburgh, and after taking the degree of M.D. at the latter place in 1799 established himself there as a teacher of chemistry. From 1796 to 1800 he was sub-editor of the *Encyclopaedia Britannica*, in succession to his elder brother, James Thomson (1768–1855), who filled that position in 1795–1796, and who in 1805 was ordained to the parish of Eccles, Berwickshire; and the chemical and mineralogical articles which he contributed to the supplement to the third edition formed the basis of his *System of Chemistry*, the first edition of which was published in 1802 and the seventh in 1831. At first this work was merely a compilation, but in the later editions many of his original results were incorporated; the third edition (1807) is noteworthy as containing the first detailed account of the atomic theory, communicated to him by John Dalton himself. In 1811 he left Edinburgh, and after a visit to Sweden went to London, where in 1813 he began to edit the *Annals of Philosophy*, a monthly scientific journal which in 1827 was merged in the *Philosophical Magazine*. In 1817 he became lecturer in chemistry at Glasgow University, and in the following year was appointed to the regius professorship. This chair he retained until his death, which happened on the 2nd of July 1852 at Kilmun, Argyleshire; but from 1841 he was assisted by his nephew and son-in-law Robert Dundas Thomson (1810–1864), who subsequently became medical officer of health for St Marylebone, London, and after 1846 he ceased active work altogether. He was a most energetic professor, and, according to his colleague, but no relation, Lord Kelvin (Sir William Thomson), founded the first chemical laboratory for students at a time when practical work was scarcely recognized as a necessary part of chemical education. He did much to spread a knowledge of Dalton's atomic theory, and carried out many experiments in its support, but his strong predilections in favour of Prout's hypothesis tended to vitiate his results, many of which were sharply criticized by J. J. Berzelius and other chemists. In addition to various textbooks he published a *History of Chemistry* (1830–1831) which has provided material for many chemical biographers, but which, although it reads very plausibly, cannot be regarded as an authority of unimpeachable accuracy. His eldest son, Thomas Thomson (1817–1878) graduated as M.D. at Glasgow in 1839, accompanied

Sir J. D. Hooker on his travels in Sikkim in 1850, and collaborated with him in publishing his *Flora indica* in 1855 and in 1854 was appointed superintendent of the botanic gardens at Calcutta, also acting as professor of botany at the Calcutta medical college.

THOMSON, WILLIAM (1819–1890), English divine, archbishop of York, was born on the 11th of February 1819 at Whitehaven, Cumberland. He was educated at Shrewsbury and at Queen's College, Oxford, of which he became a scholar. He took his B.A. degree in 1840, and was soon afterwards made fellow of his college. He was ordained in 1842, and worked as a curate at Cuddesdon. In 1847 he was made tutor of his college, and in 1853 he delivered the Bampton lectures, his subject being "The Atoning Work of Christ viewed in Relation to some Ancient Theories." These thoughtful and learned lectures established his reputation and did much to clear the ground for subsequent discussions on the subject. Thomson's activity was not confined to theology. He was made fellow of the Royal and the Royal Geographical Societies. He also wrote a very popular *Outline of the Laws of Thought*. He sided with the party at Oxford which favoured university reform, but this did not prevent him from being appointed provost of his college in 1855. In 1858 he was made preacher at Lincoln's Inn and there preached some striking sermons, a volume of which he published in 1861. In the same year he edited *Aids to Faith*, a volume written in opposition to *Essays and Reviews*, the progressive sentiments of which had stirred up a great storm in the Church of England. In December 1861 he was rewarded with the see of Gloucester and Bristol, and within a twelvemonth he was elevated to the archiepiscopal see of York. In this position his moderate orthodoxy led him to join Archbishop Tait in supporting the Public Worship Regulation Act, and, as president of the northern convocation, he came frequently into sharp collision with the lower house of that body. But if he thus incurred the hostility of the High Church party among the clergy, he was admired by the laity for his strong sense, his clear and forcible reasoning, and his wide knowledge, and he remained to the last a power in the north of England. In his later years he published an address read before the members of the Edinburgh Philosophical Institution (1868), one on *Design in Nature*, for the Christian Evidence Society, which reached a fifth edition, various charges and pastoral addresses, and he was one of the projectors of *The Speaker's Commentary*, for which he wrote the "Introduction to the Synoptic Gospels." He died on the 25th of December 1890.

See the *Quarterly Review* (April 1892).

THOR, one of the chief deities of the heathen Scandinavians. He is represented as a middle-aged man of enormous strength, quick to anger, but benevolent towards mankind. To the harmful race of giants (demons), on the other hand, he was an implacable foe, and many stories are told in the poetic and prose Eddas of the destruction which he brought upon them at various times with his hammer. On the whole his figure is somewhat secondary in the mythology to that of Odin, who is represented as his father. But there is no doubt that in Iceland he was worshipped more than any other god, and the same seems to have been the case in Norway—indeed, perhaps, in all northern countries—except among the royal families. Even in the great temple at Upsala his figure is said to have occupied the chief place. There is evidence that a corresponding deity named Thunor or Thonar was worshipped in England and on the Continent, but little information is obtainable regarding him, except that he was identified with the Roman Jupiter. His name is identical with the Teutonic word for thunder, and even in Sweden the association of Thor with the thunder seems not to have been forgotten. Outside the Teutonic area he has close affinities not only with Jupiter or Zeus, but still more with the Lithuanian god Perkunas, whose name (which likewise means "thunder") appears to be connected with that of Thor's mother (Fiörgyn). The Varangian god Perun was probably Thor himself under a Slavonic name (Russian *perun*, "thunderbolt").

See H. Petersen, *Om Nordboernes Gudedyrkelse og Gudetro i Hedenold* (Copenhagen, 1876). For other references see TEUTONIC PEOPLES: *Religion* (*ad fin*). (H. M. C.)

THORAX (Gr. θώραξ, breastplate, also the part of the body covered by it), the anatomical term for the chest, that part of the body which contains the heart and lungs (see ANATOMY: *Superficial and Artistic*, and SKELETON: *Axial*). For the surgery of the thorax reference may be made to the headings HEART, LUNG and RESPIRATORY SYSTEM.

THORBECKE, JAN RUDOLF (1798–1872), Dutch statesman, was born at Zwolle, in the province of Overijssel, on the 14th of January 1798. Thorbecke was of German extraction, his grandfather, Heinrich Thorbecke, having settled in Overijssel towards the end of the 17th century. Little is known of his youth, beyond the fact that he was sent in the year of Waterloo to Amsterdam for his education. For two years he stayed with a Lutheran clergyman of the name of Sartorius, whilst attending the lectures of the Athenaeum Illustre. In 1817 he commenced his studies at Leiden University, proving a brilliant scholar, and twice obtaining a gold medal for his prize essays. In 1820 he obtained the degrees of Lit.D. and LL.D. In the following years Thorbecke undertook a journey of research and study in Germany, staying at most of her famous universities, and making the acquaintance of his best-known contemporaries in the fatherland. At Giessen he lectured as an extraordinary professor, and at Göttingen, in 1824, published his treatise, *Ueber das Wesen der Geschichte*. After his return to Amsterdam in 1824 Thorbecke wrote his first political work of any importance, *Bedenkingen aangaande het Recht en den Staat* ("Objections anent Law and the State"), which by its close reasoning and its legal acumen at once drew attention to the young barrister, and procured him in 1825 a chair as professor in Ghent University. Here he wrote two pamphlets of an educational character before 1830. The Belgian revolt of that year forced Thorbecke to resign his position at Ghent, and he subsequently went to Leiden. He did not approve of the Belgian movement, nor of the part that Europe played in it, and published his views in three pamphlets, which appeared in the years 1830 and 1831. In 1831 he was appointed professor of jurisprudence and political science at Leiden University. In that capacity, and, before his appointment at Leiden, as a lecturer on political science, history and economics at Amsterdam, he gained great reputation as a political reformer, particularly after the publication of his standard work, *Aanteekeningen op de Grondwet* ("Annotations on the Constitution," 1839; 2nd ed., Amsterdam, 1841–1843), which became the textbook and the groundwork for the new reform party in Holland, as whose leader Thorbecke was definitely recognized. Thorbecke's political career until his death, which occurred at the Hague on the 4th of June 1872, is sketched under HOLLAND: *History*. Thorbecke's speeches in the Dutch legislature were published at Deventer in six volumes (1867–1870), to which should be added a collection of his unpublished speeches, printed at Groningen in 1900. The first edition of his *Historische Schetsen* ("Historical Essays") was issued in 1860, the second in 1872. At Amsterdam there appeared in 1873 a highly interesting *Correspondence* with his academy friend and lifelong political adversary Groen van Prinsterer (*q.v.*), which, although dating back to the early 'thirties, throws much light on their subsequent relations and the political events that followed 1848. Of Dutch statesmen during the Napoleonic period, Thorbecke admired Falck and Van Hogendorp most, whose principles he strove to emulate. Of Van Hogendorp's *Essays* and *Speeches*, indeed, he published a standard edition, which is still highly valued. Thorbecke's speeches form a remarkable continuation of Van Hogendorp's orations, not only in their style, but also in their train of thought. Thorbecke's funeral furnished the occasion for an imposing national demonstration, which showed how deeply he was revered by all classes of his countrymen. In 1876 a statue of Thorbecke was unveiled in one of the squares of Amsterdam.

Thorbecke's gifts and public services as a statesman have been as fully recognized as his political genus has been. As an orator and writer his style was clear and forcible. His very dogmatism brought him many enemies, but at times, especially when he went in advance of his time, he was a much misunderstood man. These misunderstandings, frequently wilful, extended often beyond the domain of pure politics. Thus, by his enemies, Thorbecke was often held up to scorn as a pure materialist and no friend of the fine arts, because at a sitting of the states-general in 1862 he had said that it is not the duty of the state, nor in the true interest of art itself, for the government to "protect" art, since all state-aided art must be artificial, like any forced plant. This was popularly condensed into the aphorism, yet current in Holland, that "Art is not the business of the government," and Thorbecke was condemned as the author of it. Again, his adversaries used to call him a dangerous demagogue. As a matter of fact, there was no more ardent royalist than Thorbecke. He believed in constitutional monarchy, as offering the best guarantees both for sovereign and people, and he was bitterly opposed to all forms of state socialism. Long before his death he realized that he had outlived his own principles, and many of his former admirers had commenced to dub him a "rank conservative," whose political aims and reforms were no longer adequate. But Thorbecke's life-work will endure, and the Dutch constitution of 1887 practically embodied his principles, as laid down in the constitution of 1848. The former is the outcome of the latter and could not have been made without it.

The best biographical sketch of Thorbecke we owe to the late Professor Buys, his principal scholar and devoted friend, whose biography appeared in 1876 at Tiel. Another biography which deserves mention was issued in the same year at the Hague, from the pen of Dr J. A. Levy, an Amsterdam lawyer. (H. Tı.)

THOREAU, HENRY DAVID (1817–1862), American recluse, naturalist and writer, was born at Concord, Massachusetts, on the 12th of July 1817. To Thoreau this Concord country contained all of beauty and even grandeur that was necessary to the worshipper of nature: he once journeyed to Canada; he went west on one occasion; he sailed and explored a few rivers; for the rest, he haunted Concord and its neighbourhood as faithfully as the stork does its ancestral nest. John Thoreau, his father, who married the daughter of a New England clergyman, was the son of a John Thoreau of the isle of Jersey, who, in Boston, married a Scottish lady of the name of Burns. This last-named John was the son of Philippe Thoreau and his wife Marie le Gallais, persons of pure French blood, settled at St Helier, in Jersey. From his New England Puritan mother, from his Scottish grandmother, from his Jersey-American grandfather and from his remoter French ancestry Thoreau inherited distinctive traits: the Saxon element perhaps predominated, but the "hauntings of Celtism" were prevalent and potent. The stock of the Thoreaus was a robust one; and in Concord the family, though never wealthy nor officially influential, was ever held in peculiar respect. As a boy, Henry drove his mother's cow to the pastures, and thus early became enamoured of certain aspects of nature and of certain delights of solitude. At school and at Harvard University he in nowise distinguished himself, though he was an intelligently receptive student; he became, however, proficient enough in Greek, Latin, and the more general acquirements to enable him to act for a time as a master. But long before this he had become apprenticed to the learning of nature in preference to that of man: when only twelve years of age he had made collections for Agassiz, who had then just arrived in America, and already the meadows and the hedges and the stream-sides had become cabinets of rare knowledge to him. On the desertion of schoolmastering as a profession, Thoreau became a lecturer and author, though it was the labour of his hands which mainly supported him through many years of his life: professionally he was a surveyor. In the effort to reduce the practice of economy to a fine art he arrived at the conviction that the less labour a man did, over and above the positive demands of necessity, the better for him and for the community at large; he would have had the order of the week reversed—six days of rest for one of labour. It was in 1845 he made the now famous experiment of Walden. Desirous of proving to himself and others that man could be as independent of this kind as the nest-building bird, Thoreau retired to a hut of his own construction on the pine-slope over against the shores of Walden Pond—a hut which he built, furnished and kept in order entirely by the labour of his own hands. During the two years of his residence in Walden woods he lived by the exercise of a little surveying, a little job-work and the tillage of a few acres of ground which produced him his beans and potatoes. His absolute independence was as little gained as if he had camped out in Hyde Park; relatively he lived the life of a recluse. He read considerably, wrote abundantly, thought actively if not widely, and came to know beasts, birds and fishes with an intimacy more extraordinary than was the case with St Francis of Assisi. Birds came at his call, and forgot their hereditary fear of man; beasts lipped and caressed him; the very fish in lake and stream would glide, unfearful, between his hands. This exquisite familiarity with bird and beast would make us love the memory of Thoreau if his egotism were triply as arrogant, if his often meaningless paradoxes were even more absurd, if his sympathies were even less humanitarian than we know them to have been. His *Walden*, the record of this fascinating two years' experience, must always remain a production of great interest and considerable psychological value. Some years before Thoreau took to Walden woods he made the chief friendship of his life, that with Emerson. He became one of the famous circle of the transcendentalists, always keenly preserving his own individuality amongst such more or less potent natures as Emerson, Hawthorne and Margaret Fuller. From Emerson he gained more than from any man, alive or dead; and, though the older philosopher both enjoyed and learned from the association with the younger, it cannot be said that the gain was equal. There was nothing electrical in Thoreau's intercourse with his fellow men; he gave off no spiritual sparks. He absorbed intensely, but when called upon to illuminate in turn was found wanting. It is with a sense of relief that we read of his having really been stirred into active enthusiasm anent the wrongs done the ill-fated John Brown. With children he was affectionate and gentle, with old people and strangers considerate. In a word, he loved his kind as animals, but did not seem to find them as interesting as those furred and feathered. In 1847 Thoreau left Walden Lake abruptly, and for a time occupied himself with lead-pencil making, the parental trade. He never married, thus further fulfilling his policy of what one of his essayist-biographers has termed "indulgence in fine renouncements." At the comparatively early age of forty-five he died, on the 6th of May 1862. His grave is in the Sleepy Hollow cemetery at Concord, beside those of Hawthorne and Emerson.

Thoreau's fame will rest on *Walden; or, Life in the Woods* (Boston, 1854) and the *Excursions* (Boston, 1863), though he wrote nothing which is not deserving of notice. Up till his thirtieth year he dabbled in verse, but he had little ear for metrical music, and he lacked the spiritual impulsiveness of the true poet. His weakness as a philosopher is his tendency to base the laws of the universe on the experience-born, thought-produced convictions of one man—himself. His weakness as a writer is the too frequent striving after antithesis and paradox. If he had had all his own originality without the itch of appearing original, he would have made his fascination irresistible. As it is, Thoreau holds a unique place. He was a naturalist, but absolutely devoid of the pedantry of science; a keen observer, but no retailer of disjointed facts. He thus holds sway over two domains: he had the adherence of the lovers of fact and of the children of fancy. He must always be read, whether lovingly or interestedly, for he has all the variable charm, the strange saturninity, the contradictions, austerities and delightful surprises, of Nature herself.

After Thoreau's death were also published: *The Maine Woods* (Boston, 1863); *Cape Cod* (Boston, 1865); *A Yankee in Canada* (Boston, 1866). In the *Atlantic Monthly*, in 1862, appeared "Walking," "Autumn Tints" and "Wild Apples"; in 1863, "Night and

Moonlight." The standard editions of his works are *The Writings of Henry David Thoreau*, Riverside edition (11 vols., Boston, 1894–1895), and Manuscript edition (12 vols., ibid., 1907).

Sanborn, *Henry David Thoreau* (Boston, 1882), in the "American Men of Letters Series"; H. S. Salt, *Life of Henry David Thoreau* (London, 1890); *Some Unpublished Letters of H. D. and Sophia E. Thoreau* (Jamaica, New York, 1890); J. Russell Lowell, *My Study Windows*; R. L. Stevenson, *Familiar Studies in Men and Books*; and F. H. Allen, *Bibliography of H. D. Thoreau* (Boston, 1908). (W. Sh.)

THORFINN KARLSEFNI, or Karlsefne (*fl.* 1002–1007), Scandinavian explorer, leader of the chief medieval expedition for American colonization. Thorfinn belonged to a leading Icelandic family and had great success in trading voyages. In 1002 he came to Greenland, married Gudrid, widow of Red Eric's son Thorstein, and put himself at the head of a great expedition now undertaken from Ericsfiord for the further exploration and settlement of the western Vinland (south Nova Scotia?) lately discovered by Leif Ericsson (*q.v.*). Three vessels took part in the venture, with 160 men and some women, including Gudrid, and Freydis, a natural daughter of Red Eric. They first sailed north-west to the Vesterbygd or "Western Settlement" of Greenland, thence to Bear Island, and thence away to the south till they reached a country they named *Helluland* (some part of Labrador?) from its great flat slabs of stone (*hellur*). Two days' sail farther southward brought them to a thickly-wooded land they called *Markland* (*i.e.* Woodland, our Newfoundland?). Two days after this they sighted land to the right hand, and came to a cape, where they found the keel of a ship—perhaps a relic of some earlier, possibly Scandinavian explorer—and which they called therefore *Kialames* (Keelness; Cape Breton, or some adjacent point?); the long bleak sandy shores of this coast they called the *Wonderstrands* (on the east coast of Cape Breton Island?). After passing the *Wonderstrands* and reaching a coast indented with bays, Thorfinn put two fleet Gael runners ashore, with orders to explore southwards (see Leif Ericsson): they returned with grapes and wild wheat, proofs that the Northmen were not far from Vinland. The fleet now stood in to a bay called by the explorers *Streamfiord* or Firth of Currents, and wintered there (1003–1004), suffering some privations, and apparently getting no more news of the fruitful country desired. Thorfinn's son Snorri was born this first autumn in the new world. Next spring nine of the party, headed by the chief malcontent Thorhall, Red Eric's huntsman, sailed off northward, intending to come to Vinland by rounding Keelness and thence working round west (and south). Adverse weather drove them to Ireland, where they were enslaved. Meanwhile Thorfinn, with the rest of the venturers, sailed south "for a long time," till they reached a spot they called *Hop*, at the mouth of a river which flows from a lake into the sea (several estuaries near the southern extremity of Nova Scotia would do equally well here). Here they found the "self-sown" wheatfields and vines of Leif's Vinland, and here accordingly they settled and built their huts above the lake (1004–1005). After a fortnight natives, swarthy and ill-looking, with ugly hair, great eyes and broad cheeks (Beothuk or Micmac Indians?) appeared with many skin canoes; in the spring following these *Skraelings* came back and bartered with their visitors. Terrified by a bull belonging to the latter they fled, and after three weeks returned to fight. They were beaten off, but the Northmen narrowly escaped destruction, and two of their number (one a leading settler) were slain. The colony at Hop was therefore abandoned and the whole force returned to Streamfiord. Thence Thorfinn revisited Hop, staying two months; and also made a voyage northward in search of Thorhall, rounding Keelness and sailing westward (along the north coast of Cape Breton Island?), and apparently southward also, till they came to the mouth of a river flowing from east to west. Here Thorvald Ericsson was killed by a (Skraeling?) arrow, and the expedition came back to Streamfiord where they passed the next winter (1005–1006). Internal dissensions now broke out, mainly about the women of the colony, and in the next summer (1006) the entire project of Vinland settlement was abandoned and the fleet sailed to Markland. Two Skraeling children were captured here and the expedition divided, Thorfinn making Greenland and Ericsfiord in safety with his own vessel, while the other was lost in the Irish Sea, only half the crew escaping to Ireland in the ship's boat.

It may be noticed that the *Flatey Book* narrative gives a somewhat different but much slighter account of Thorfinn's expedition, making both Thorvald Ericsson and Freydis undertake separate Vinland ventures—one before, the other after, Karlsefni's enterprise—Thorvald being killed on his (as in *Red Eric Saga*, but with divergent details), and Freydis on her committing atrocities upon her comrades, the Icelanders Helgi and Finnbogi, which are unnoticed in *Red Eric*. The latter, however, in its mention of the domestic broils which arose over the women of the colony in its third winter, points to something which may have been the germ of the highly elaborated Freydis story in *Flatey*.

On *Flatey Book*, *Red Eric Saga* and the whole bibliography for the Vinland voyages, including that of Thorfinn, see Leif Ericsson and Vinland. The six Vinland voyages of *Flatey*, we may repeat, *Red Eric* reduces to three, wholly omitting the alleged voyage of Biarni Heriulfsson, and grouping those of Thorvald Ericsson and Freydis with Thorfinn Karlsefni's in one great colonizing venture. (C. R. B.)

THORIANITE, a rare mineral, discovered by W. D. Holland, and found in the gem-gravels of Ceylon, where it occurs as small, heavy, black, cubic crystals, usually much water-worn. It was so named by W. R. Dunstan, on account of its high percentage of thorium (about 70% ThO_2); it also contains the oxides of uranium, lanthanum, cerium and didymium. Helium is present, and the mineral is slightly less radio-active than pitchblende. It has been examined for new elements. Miss Evans (*Journ. Chem. Soc.*, 1908, 93, p. 666) obtained what is possibly a new element, whilst M. Ogawa (*Journ. Coll. Sci. Tokyo*, 1908, vol. 25) found indications of three new species: one which he called *nipponium*, with an equivalent weight of about 50 and atomic weight 100; the second with an equivalent of about 16·7; whilst the third yielded a radio-active oxide.

THORITE, a rare mineral consisting of thorium silicate, crystallizing in the tetragonal system and isomorphous with zircon. The theoretical formula, $ThSiO_4$, requires 81·5% of thoria, but analyses show only 50–70%, there being also some uranium, cerium, &c. The mineral is almost always altered by hydration and is then optically isotropic and amorphous. Owing to differences in composition and to alteration, the specific gravity varies from 4·4 to 5·4. The colour is usually light brown, but in the variety known as "orangite" it is orange-yellow. The mineral occurs as isolated crystals and small masses in the augite-syenite near Brevik in South Norway; also at Arendal, and in the gem-gravels of Ceylon. If found in larger amount it would be an important source of thoria for incandescent gas mantles. (L. J. S.)

THORIUM (symbol Th, atomic weight 232·42 [O=16]), a metallic chemical element. It belongs to the group of metals whose oxides are generally denominated "rare earths," and its history is bound up in the history of the group, which is especially interesting from the fact that it supplies the material for the manufacture of the mantles used in incandescent gas-lighting, and also that the radio-active substances are almost invariably associated with these oxides. The name *thoria* (after the Scandinavian god Thor) was first given in 1815 by Berzelius to a supposed new earth which he had extracted from several rare Swedish minerals. This "new earth" turned out to be nothing more nor less than a basis yttrium phosphate. In 1828 he gave the name thoria to an earth which he extracted from a mineral found at Lëvön. This mineral is the modern thorite. Thorium has proved to be very widely, although extremely sparingly, distributed: pyrochlor, orangite, monazite, euxenite, gadolonite, orthite, and in fact most of the rare minerals of this type contain it (see B. Szilard, *Le Radium*, 1909, 6, p. 233). The extraction of thorium salts from these minerals is a matter of much tedium. Metallic thorium is obtained by heating potassium thorium chloride or the tetrachloride with sodium (see W. von Bolton, R. J. Meyer and H. Karstens, *Journ. Chem. Soc.*, 1909, vol. 96). It forms microscopic hexagonal plates having a silver-white streak. It is very heavy, its density being about 11; it inflames when heated in air and is not attacked by alkalis; it readily dissolves in nitric acid and aqua regia, but with difficulty in hydrochloric acid.

In its salts, thorium is tetravalent, and in the periodic classification it occurs in the same sub-group as titanium, cerium and zirconium.

Thorium dioxide or *thoria*, ThO_2, is the most important compound, being manufactured commercially in comparatively large quantities from monazite sands, with a view to its utilization for gas mantles (see LIGHTING, GAS). It is an amorphous white powder; but it may also be obtained in crystals isomorphous with cassiterite by heating the amorphous form with borax to a very high temperature. An oxide Th_2O_5 is formed by heating the oxalate.

Thorium fluoride, ThF_4, is obtained as a heavy white insoluble powder by dissolving the hydrate in hydrofluoric acid and evaporating. By precipitating a thorium salt with a fluoride, a gelatinous hydrate, $ThF_4 \cdot 4H_2O$, is obtained. Acid potassium fluoride precipitates $K_2ThF_6 \cdot 4ThF_4 \cdot H_2O$ from a solution of thorium chloride. Potassium thorofluoride, $K_2ThF_6 \cdot 4H_2O$, is a heavy black powder formed by boiling the hydroxide with potassium fluoride and hydrofluoric acid. *Thorium chloride*, $ThCl_4$, is obtained as white shining crystals by heating a mixture of carbon and thoria in a current of chlorine. Baskerville (*Journ. Amer. Chem. Soc.*, 1904, 26, p. 922) divided the product into three fractions according to their volatility. He concluded that the first contained the chloride of *berzelium*, having an atomic weight of 212, the second contained thorium chloride, and the third the chloride of *carolinium*, having an atomic weight of 255·6. E. Chauvenet (*Compt. rend.*, 1908, 147, p. 1046) obtains it by heating thoria in a current of carbonyl chloride. Thorium chloride readily deliquesces on exposure and forms double salts with alkaline chlorides.

Thorium sulphate, $Th(SO_4)_2$, is obtained by dissolving the oxide in sulphuric acid. It forms several crystalline hydrates. Evaporation of a solution at ordinary temperatures gives colourless monoclinic prisms of $Th(SO_4)_2 \cdot 9H_2O$, which is isomorphous with uranium sulphate, $U(SO_4)_2 \cdot 9H_2O$. Above 43° $Th(SO_4)_2 \cdot 4H_2O$ is deposited. B. Roozeboom (*Zeit. phys. Chem.*, 1890, 5, p. 198) has described several other hydrates. Thorium sulphate forms double salts with the alkaline sulphates. *Thorium nitrate*, $Th(NO_3)_4 \cdot 12H_2O$, forms white deliquescent tables very soluble in water. It forms double salts such as $MgTh(NO_3)_6 \cdot 8H_2O$, which are isomorphous with the corresponding cerium compounds. *Thorium sulphide*, ThS_2, is obtained by burning the metal in sulphur. It cannot be produced by precipitation.

The atomic weight has been variously given. Berzelius found 235·5; Delafontaine, 229·7; Cleve, 232·6 by analyses of the sulphate, and 232·2 by analyses of the oxalate. Krüss and Nilson derived the value 230·7 ($H=1$) from analyses of the carefully purified sulphate.

For the so-called "disintegration of the thorium atom" and the relation of this element to the general subject of radio-active emanations, see RADIO-ACTIVITY.

A number of salts of thorium have been prepared for therapeutic use, including the hydroxide, nitrate, salicylate, oleate and lactate. The oleate has been used in chronic eczema and psoriasis and locally in cancer. Inhalations of thorium emanations produced from thorium nitrate through a wash-bottle inhaler are said to have a bactericidal action in diseases of the lungs. F. Soddy has used them in phthisis, and Louisa Chesney speaks favourably of the emanations in chronic and acute laryngitis and in tuberculous laryngeal ulcerations.

THORN (Polish *Torun*), a fortress town of Germany, in the Prussian province of West Prussia, situated on the right bank of the Vistula, near the point where the river enters Prussian territory, 85 m. by rail N.E. of Posen, 92 m. S. of Danzig and 12 m. from the Russian frontier at Alexandrovo. Pop. (1895), 30,314; (1906), 43,435. Its position as a bridge head commanding the passage of the Vistula makes it a point of strategic importance; it was strongly fortified in 1818, and in 1878 was converted into a fortress of the first class. The defensive works consist of a circle of outlying forts, about 2½ m. from the centre of the town—eight on the right and five on the left bank of the river. The "old town," founded in 1231, and the "new town," founded thirty-three years later, were united in 1454, and both retain a number of quaint buildings dating from the 15th and 16th centuries, when Thorn was a flourishing member of the Hanseatic League. The town-hall of the 14th and 16th centuries, the churches of St John of the Virgin, and of St James (all of the 13th–14th centuries), the ruined castle of the Teutonic order (a tower, the so-called "Dansker"), and a leaning tower, the sole remnant of the old environing walls, are among the most interesting of the ancient edifices. Among modern buildings may be mentioned the Artushof, containing concert and assembly halls, the new garrison church (1897), and the monument erected in 1853 to Copernicus, who was a native of Thorn. The ancient wooden bridge, now burned down, at one time the only permanent bridge across the lower Vistula, has been succeeded by a massive iron railway viaduct, 3300 ft. long. Thorn carries on an active trade in grain, timber, wine, groceries and minerals, and has ironworks, saw-mills, and various other manufactures. It is famous for its *Pfefferkuchen*, a kind of gingerbread. Part of the trade is carried on by passenger and cargo vessels on the Vistula, which ply as far as Warsaw.

Thorn, founded in 1231 by the Teutonic order as an outpost against the Poles, was colonized mainly from Westphalia. The first peace of Thorn, between the order and the Poles, was concluded in 1411. In 1454 the townspeople revolted from the knights of the order, destroyed their castle, and attached themselves to the king of Poland. This resulted in a war, which was terminated in 1466 by the second peace of Thorn. In the 15th and 16th centuries Thorn was a Hanse town of importance, and received the titles of "Queen of the Vistula" and "the beautiful." It embraced the Reformation in 1557, and in 1645 it was the scene of a *colloquium charitativum*, or discussion betwixt the doctors of the rival creeds, which, however, resulted in no agreement. In 1724 a riot between the Protestant and Roman Catholic inhabitants was seized upon by the Polish king as a pretext for beheading the burgomaster and nine other leading Protestant citizens, an act of oppression which is known as the "blood-bath of Thorn." The second partition of Poland (1793) conferred Thorn upon Prussia; by the treaty of Tilsit it was assigned to the duchy of Warsaw; but since the congress of Vienna (1815) it has again been Prussian.

See Wernicke, *Geschichte Thorns* (Thorn, 1839–1842); Hoburg, *Die Belagerungen der Stadt und Festung Thorn* (Thorn, 1850); and Steinbrecht, *Die Baukunst des deutschen Ritterordens in Preussen* (1st part, Berlin, 1884); Uebrick, *Thorn* (Danzig, 1903).

THORN (O. Eng. *þorn*, cf. Du. *doorn*, Ger. *Dorn*, &c), in botany, a hard pointed structure, also termed a "spine," generally representing a small branch, as in hawthorn, where a normal branch arising in the axil of a leaf is replaced by a sharply pointed thorn; accessory buds on each side of the thorn and developed in the same leaf-axil will grow in the next season into ordinary branches. The similarly developed thorns of the honey-locust (*Gleditschia*) are branched. In other cases, as the sloe or the wild pear, branches become spiny at the apex tapering into a stiff leafless point. On a cultivated tree these branches disappear owing to their more vigorous growth. Leaves may be modified into spines, as in barberry, the leaves of which show every gradation between a leaf with a spiny-toothed edge and those which have been reduced to simple or multiple spines. In some species of *Astragalus* the petiole of the pinnately compound leaf persists after the fall of the leaflets as a sharp spine. In the false acacia (*Robinia*) the stipules are represented by spines.

The reduction of the leaf-surface, of which the spinous habit is often an expression, is associated with growth in dry or exposed windy places. Thus, in the gorse, a characteristic plant of exposed localities such as open commons, the smaller branches, instead of being leaf-bearing shoots, are reduced to slender green spines, while the leaves on the main shoots are also more or less spinous in character. As the giving off of water from its surface is one of the chief functions of a leaf, this process is thus reduced to a minimum in situations where water is scarce or would be liable to be given off too rapidly. An extreme case is afforded by the cacti and cactus-like euphorbias, which are a characteristic type of desert vegetation where water is extremely scarce. The whole plant is reduced to a simple or branching succulent, leafless, columnar or flattened stem, the branches of which are represented by small clusters of thorns. Incidentally the thorns protect the plant which bears them from the attacks of animals seeking food.

Prickles are structures of less importance from the morphological point of view, being mere superficial outgrowths which may occur anywhere on stem or leaf, or even fruit.

THORNABY-ON-TEES, a municipal borough in the North Riding of Yorkshire, England, 3 m. S.W. of Middlesbrough, on the North-Eastern railway. Pop. (1901), 16,054. It lies opposite Stockton-on-Tees, with which it is connected by a bridge, on the river Tees. There are blast furnaces, iron foundries, engineering works, iron ship-building yards, extensive saw-mills, flour-mills and a manufactory of "blue and white" pottery. The town was formerly known as South Stockton, and is still included in the parliamentary borough of Stockton (it is within the Cleveland division of the county), but was incorporated as a separate municipal borough in 1892. It is under a mayor, 6 aldermen and 18 councillors. Area, 1927 acres.

THORNE, a market town in the Doncaster parliamentary division of the West Riding of Yorkshire, 10 m. N.E. of Doncaster by the North-Eastern railway, served also by a branch of the Great Central railway. Pop. (1901), 3818. It lies near the river Don, in a low, flat district, which was formerly a marshy waste, resembling the fens of the eastern counties. Hatfield Chase, a portion of this tract south of Thorne, was partly drained by the Dutch engineer Vermuyden in the 17th century, and there were in the district numerous Dutch settlers. The Chase is generally considered to have been the scene of the battle of Heathfield in 633, when King Edwin of Northumbria fell before the heathen King Penda of Mercia. The Levels, as this district is generally named, are of remarkable fertility, and Thorne, having water communication with Goole and the Humber, is consequently an agricultural centre of importance; while some barge-building and a trade in peat fibre are also carried on. The church of St Nicholas is a fine building of various periods from the 12th century.

THORNHILL, SIR JAMES (1676–1734), English historical painter, was born at Melcombe Regis, Dorset, in 1676, of an ancient but impoverished county family. His father died while he was young, but he was befriended by his maternal uncle, the celebrated Dr Sydenham, and apprenticed to Thomas Highmore, serjeant-painter to King William III., a connexion of the Thornhill family. Little is known regarding his early career. About 1715 he visited Holland, Flanders and France; and, having obtained the patronage of Queen Anne, he was in 1719–1720 appointed her serjeant-painter in succession to Highmore, and was ordered to decorate the interior of the dome of St Paul's with a series of eight designs, in chiaroscuro heightened with gold, illustrative of the life of that apostle—a commission for which Louis Laguerre had previously been selected by the commissioners for the repair of the cathedral. He also designed and decorated the saloon and hall of Moor Park, Herts, and painted the great hall at Blenheim, the princesses' apartments at Hampton Court, the hall and staircase of the South Sea Company, the chapel at Wimpole, the staircase at Easton-Neston, Northamptonshire, and the hall at Greenwich Hospital, usually considered his most important and successful work, upon which he was engaged from 1708 to 1727. Among his easel pictures are the altar-pieces of All Souls and Queen's College chapels, Oxford, and that in Melcombe Regis church; and he executed such portrait subjects as that of Sir Isaac Newton, in Trinity College, Cambridge, and the picture of the House of Commons in 1730, in the possession of the earl of Hardwicke, in which he was assisted by Hogarth, who married Jane, his only daughter. He also produced a few etchings in a slight and sketchy but effective manner, and executed careful full-size copies of Raphael's cartoons, which now belong to the Royal Academy. About 1724 he drew up a proposal for the establishment of a royal academy of the arts, and his scheme had the support of the lord treasurer Halifax, but government declined to furnish the needful funds. Thornhill then opened a drawing-school in his own house in James Street, Covent Garden, where instruction continued to be given till the time of his death. He acquired a considerable fortune by his art, and was enabled to repurchase his family estate of Thornhill, Dorsetshire. In 1715 he was knighted by George I., and in 1719 he represented Melcombe Regis in parliament, a borough for which Sir Christopher Wren had previously been member. Having been removed from his office by some court intrigue, and suffering from broken health and repeated attacks of gout, he retired to his country seat, where he died on the 4th of May 1734. His son James, also an artist, succeeded his father as serjeant-painter to George II. and was appointed "painter to the navy."

The high contemporary estimate of Sir James Thornhill's works has not since been confirmed; in spite of Dr Young, "late times" do *not*

"Understand
How Raphael's pencil lives in Thornhill's hands."

He is weak in drawing—indeed, when dealing with complicated figures he was assisted by Thomas Gibson; and, ignorant of the great monumental art of Italy, he formed himself upon the lower model of Le Brun.

THORNHILL, an urban district in the Morley parliamentary division of the West Riding of Yorkshire, England, 2 m. S. of Dewsbury, on the Great Northern, Lancashire & Yorkshire, and London & North-Western railways. Pop. (1901), 10,290. The church of St Michael has a modern nave, but the chancel with aisles are of good Decorated work, and the tower is Perpendicular. There are interesting monuments of the ancient family of Savile, the site of whose mansion, Thornhill Hall, may be traced near the church. The east window of the church contains fine fragments of stained glass of the 15th century. The large industrial population is employed in the woollen mills and manufactures of shoddy, carpets, &c., which are numerous in this locality.

THORNHILL, a village of the parish of Morton, Nithsdale, Dumfriesshire, Scotland, 14 m. N.N.W. of Dumfries by the Glasgow & South-Western railway. Pop. (1901), 1132. It is beautifully situated in the midst of tree-clad hills and watered by the bountiful Nith and such streams as the Carron, Cample and Crichope. Morton parish church lies in the village, and among other buildings are the library and the natural history museum, in the grounds of which there is a statue of Richard Cameron, the covenanter (1680). The weekly sales of livestock are important, and an agricultural show is held every September. Three miles N.N.W. stands Drumlanrig Castle, a seat of the duke of Buccleuch. It is built of red sandstone in the form of a hollow square, and has 145 ft. of outer walls, which are surmounted with turrets, and capped and spired at the angles. The castle was begun in 1679 and finished in 1689, and cost the first duke of Queensberry an immense sum. He is believed to have spent but a single night under its roof. The fourth duke of Queensberry, Old "Q.," incurred the wrath of Robert Burns and Wordsworth by his wanton destruction of the magnificent woods. On the death of "Old Q." without issue in 1810, Henry, third duke of Buccleuch, succeeded to the dukedom of Queensberry, and the property has since been adequately cared for. Trees, planted on the most extensive scale, have repaired the ravages of the former owner; the gardens have been laid out with exquisite taste; and the vast policy, intersected by the Nith, is one of the finest parks in Scotland. The ruins of Tibber's Castle, dismantled in 1311 by Robert Bruce, stand in the grounds, about 1 m. from the ducal mansion. Two miles and a half N.N.E. of Thornhill is found another ruined fortress, that of Morton Castle, interesting as the residence of Thomas Randolph, earl of Moray, regent during the early years of the minority of David II., and as belonging afterwards to a branch of the Douglases, who derived from it the title of earl. About 3 m. south-east of Thornhill stands the ruined castle of Closeburn, once a stronghold of the Kirkpatricks. It was Sir Roger of that ilk who helped "mak sikker" the death of John, "Red" Comyn, of Badenoch (1306). In Closeburn parish (pop. 1275) occur cairns, tumuli and a stone circle, besides Roman and prehistoric remains. Two mineral wells give the place the promise of some degree of popular favour, likely to be enhanced by the romantic beauty of its surroundings.

THORNTON, HENRY (1760–1815), English banker and economist, was born on the 10th of March 1760. In 1784 he became a member of the banking firm of Downie, Free & Thornton, with which he was associated till his death on the 16th of January 1815. In 1783 he was elected member of parliament for Southwark, a constituency which he represented for the rest of his life. Although an indifferent speaker, he soon acquired a high reputation as an authority on financial matters. This reputation he confirmed by *An Inquiry into the Nature and Effects of the Paper Currency of England* (1802), defending the legislature in suspending cash payments. He strongly supported the income tax on its original imposition in 1798, but was in favour of a graduated system, and indeed paid his own income tax "on the scale of his ideal, not his legal debt." He was one of the founders of the Sierra Leone Company (see SIERRA LEONE) and its chairman until the colony was taken over by the English government.

THORNTON, WILLIAM THOMAS (1813–1880), English economist, was born at Burnham, Buckinghamshire, on the 14th of February 1813. In 1836 he obtained a clerkship in the London house of the East India Company. In 1858 he became secretary for public works in the India office, a post which he held till his death. He was created a C.B. in 1873. His works include *Over-population and its Remedy* (1846), in which he put forward a plan for colonizing Irish wastes by Irish peasants; *A Plea for Peasant Proprietors* (1848), in which his views were developed in greater detail; *On Labour* (1869); and *Old-fashioned Ethics and Commonsense Metaphysics*, a volume of essays, published in 1873.

THORNYCROFT, WILLIAM HAMO (1850–), British sculptor. A pupil of his father, Thomas Thornycroft, and of the Royal Academy schools, he was still a student when he was called upon to assist his father in carrying out the important fountain in Park Lane, London. He accordingly returned in 1871 to England from Italy, where he was studying, and modelled the figures of Shakespeare, Fame and Clio, which were rendered in marble and in bronze. In the following year he exhibited at the Royal Academy "Professor Sharpley," in marble, for the memorial in University College; and "Mrs Mordant," a relief—a form of art to which he has since devoted much attention. The "Fame," already mentioned, was shown in 1873. Believing that the pendulum had overshot its swing from conventional classicality towards pictorial realism, he turned from the "fleshy" school towards the Greek, while realizing the artistic necessity for modern feeling. In 1875 his "Warrior Bearing a Wounded Youth from the Field of Battle" gained the gold medal at the Royal Academy schools, and when exhibited in 1876 it divided public attention with the "Tennyson" of Woolner and "Wellington monument" sculptures of Alfred Stevens, now in St Paul's Cathedral. Then followed the dramatic "Lot's Wife," in marble (1878), and "Artemis" (1880), which for grace, elegance and purity of taste the sculptor never surpassed. He was thereupon elected an associate of the Royal Academy, and more than justified the selection by his "Teucer" of the following year, a bronze figure of extraordinary distinction which, bought for the Chantrey collection, is now in the National (Tate) Gallery of British Art. It is simple and severe, classic yet instinct with life and noble in form; and in it he touched the high-water mark of his career. Turning to the ideal, in works entirely modern in motive and treatment, Hamo Thornycroft produced "The Mower" (1884) and "A Sower" (1886); the "Stanley Memorial" in the old church at Holyhead partakes of the same character. Among the sculptor's principal statues are "The Bishop of Carlisle" (1895; Carlisle Cathedral), "General Charles Gordon" (Trafalgar Square, London), "Oliver Cromwell" (Westminster), "Dean Colet" (a bronze group—early Italianate in feeling—outside St Paul's School, Hammersmith), "King Alfred" (a colossal memorial for Winchester), the "Gladstone Monument" (in the Strand, London) and "Dr Mandell Creighton, Bishop of London" (bronze, erected in St Paul's Cathedral). Mr Thornycroft's other memorials, such as the "Queen Victoria Memorial" (Karachi), the "War Memorial" (at Durban) and the "Armstrong Memorial" (at Newcastle), are well known, and his portrait statuary and medallions are numerous. He was elected a full academician in 1888, and an honorary member of the Royal Academy of Munich. He was awarded a medal of honour at the Paris Exhibition, 1900.

See M. H. Spielmann, *British Sculpture and Sculptors of To-day* (London, 1901). (M. H. S.)

THÓRODDSEN, JÓN ÞOR ÐARSON (1819–1868), Icelandic poet and novelist, was born in 1819 at Reykhólar in western Iceland. He studied law at the university of Copenhagen, entered the Danish army as volunteer in 1848 in the war against the insurgents of Schleswig and Holstein, who were aided by Prussia and the other German States. He went back to Iceland in 1850, became sheriff (*sýslumaður*) of Barðastrandarsýsla, and later in Borgarfjarðarsýsla, where he died in 1868. He is the first novel writer of Iceland. Jónas Hallgrímsson had led the way by his short stories, but the earliest veritable Icelandic novel was Jón Thóroddsen's *Piltur og stúlka* ("Lad and Lass"), a charming picture of Icelandic country life. Still better is *Maður og kona* ("Man and Wife"), published after his death by the Icelandic Literary Society. He had a great fund of delicate humour, and his novels are so essentially Icelandic in their character, and so true in their descriptions, that he is justly considered by most of his countrymen not only as the father of the Icelandic novel, but as the best novelist Iceland has produced. His poems, mostly satirical, are deservedly popular; he follows Jónas Hallgrímsson closely in his style, although he cannot reach him in lyrical genius. (S. BL.)

THOROTON, ROBERT (1623–1678), English antiquary, belonged to an old Nottinghamshire family, which took its name from Thoroton, near Newark. He resided mainly at another village in the same neighbourhood, Car Colston, where he practised as a physician and where he lived the life of a country gentleman. He took very little part in the Civil War, although his sympathies were with the royalists, but as a magistrate he was very active in taking proceedings against the Quakers. In 1667 Thoroton, aided by a band of helpers, began to work upon his elaborate *Antiquities of Nottinghamshire*. This was published in London in 1677; it was dedicated to Gilbert Sheldon, archbishop of Canterbury, and was illustrated by engravings by W. Hollar.

In 1797 a new edition of the *Antiquities* was published by John Throsby (1740–1803), who added an additional volume. In 1897 the Thoroton Society was founded in honour of the antiquarian, its object being to promote the study of the history and antiquities of Nottinghamshire. Under its auspices annual volumes of *Transactions* and several volumes of *Records* have been published and much valuable work has been done. A brass tablet to the memory of Thoroton has been placed in Car Colston church. See J. T. Godfrey, *Robert Thoroton, Physician and Antiquary* (1890).

THORPE, BENJAMIN (1782–1870), English Anglo-Saxon scholar, was born in 1782. After studying for four years at Copenhagen University, under the Danish philologist Rasmus Christian Rask, he returned to England in 1830, and in 1832 published an English version of Cædmon's metrical paraphrase of portions of the Holy Scriptures, which at once established his reputation as an Anglo-Saxon scholar. In 1834 he published *Analecta Anglo-Saxonica*, which was for many years the standard textbook of Anglo-Saxon in English, but his best-known work is a *Northern Mythology* in three volumes (1851). His was the first complete good translation of the elder *Edda* (1866). His other works include *Ancient Laws and Institutes of England* (1840), an English translation of the laws enacted under the Anglo-Saxon kings; *The Holy Gospels in Anglo-Saxon* (1842); *Codex Exoniensis* (1842), a collection of Anglo-Saxon poetry with English translation; an English translation of Dr Lappenburg's *History of England under the Anglo-Saxon Kings* (1845); *Anglo-Saxon Poems of Beowulf* (1855), a translation; an edition for the "Rolls" series of the *Anglo-Saxon Chronicle* (1861); and *Diplomatarium Anglicum aevi saxonici* (1865), a collection of early English charters. Thorpe died at Chiswick on the 19th of July 1870. The value of his work was recognized by the grant to him, in 1835, of a civil list pension.

THORPE [or Thorp], **JOHN** (*fl.* 1570–1618), English architect. Little is known of his life, and his work is dubiously inferred, rather than accurately known, from a folio of drawings in the Soane Museum, to which Horace Walpole called attention, in 1780, in his *Anecdotes of Painting*; but how far these were his own is uncertain. He was engaged on a number of important English houses of his time, and several, such as Longleat, have been attributed to him on grounds which cannot be sustained. He was probably the designer of Kirby Hall, Northamptonshire; the original Longford Castle, Wiltshire; and the original Holland House, Kensington; and he is said to have been engaged on Rushton Hall, Northamptonshire, and Audley End, Essex (with Bernard Janssens).

See J. A. Gotch, *Architecture of the Renaissance in England* (1891–1894).

THORWALDSEN, BERTEL (1770–1844), Danish sculptor, the son of an Icelander who had settled in Denmark, and there carried on the trade of a wood-carver, was born in Copenhagen on the 19th of November 1770. While very young he learnt to assist his father; at the age of eleven he entered the Copenhagen school of art, and soon began to show his exceptional talents. In 1792 he won the highest prize, the travelling studentship, and in 1796 he started for Italy in a Danish man-of-war. On the 8th of March 1797 he arrived in Rome, where Canova was at the height of his popularity. Thorwaldsen's first success was the model for a statue of Jason, which was highly praised by Canova, and he received the commission to execute it in marble from Thomas Hope, a wealthy English art-patron. From that time Thorwaldsen's success was assured, and he did not leave Italy for twenty-three years. In 1819 he returned to Denmark, where he was commissioned to make the colossal series of statues of Christ and the twelve apostles which are now in the Fruenkirche in Copenhagen. These were executed after his return to Rome, and were not completed till 1838, when Thorwaldsen again returned to Denmark. He died suddenly in the Copenhagen theatre on the 24th of March 1844 and bequeathed a great part of his fortune for the building and endowment of a museum in Copenhagen, and also left to fill it all his collection of works of art and the models for all his sculpture—a very large collection, exhibited to the greatest possible advantage. Thorwaldsen is buried in the courtyard of this museum, under a bed of roses, by his own special wish.

On the whole Thorwaldsen was the most successful of all the imitators of classical sculpture, and many of his statues of pagan deities are modelled with much of the antique feeling for breadth and purity of design. His attempts at Christian sculpture, such as the tomb of Pius VII. in St Peter's and the "Christ and Apostles" at Copenhagen, are less successful, and were not in accordance with the sculptor's real sympathies, which were purely classic. Thorwaldsen worked sometimes with feverish eagerness; at other times he was idle for many months together. A great number of his best works exist in private collections in England. His not very successful statue of Lord Byron, after being refused a place in Westminster Abbey, was finally deposited in the library of Trinity College, Cambridge. The most widely popular among Thorwaldsen's works have been some of his bas-reliefs, such as the "Night" and the "Morning," which he is said to have modelled in one day.

See Eugène Plon, *Thorwaldsen, sa vie*, &c. (Paris, 1880); Andersen, *B. Thorwaldsen* (Berlin, 1845); Killerup, *Thorwaldsen's Arbeiten*, &c. (Copenhagen, 1852); Thiele, *Thorwaldsen's Leben* (Leipzig, 1852–1856); C. A. Rosenberg, *Thorwaldsen . . . mit 146 Abbildungen* (1896; "Künstlermonographien," No. 16); S. Trier, *Thorvaldsen* (1903); A. Wilde, *Erindringer om Jerichau og Thorvaldsen* (1884).

THOTH, the Greek name of the Egyptian god of letters, invention and wisdom (*e.g.* Thowt, *Zḥwty*), the mouthpiece and recorder of the gods, and arbiter of their disputes. Thoth is found on the earliest monuments symbolized by an ibis (*Ibis aethiopica*, still not uncommon in Nubia), which bird was sacred to him. In the Pyramid texts Thoth is already closely associated with the Osiris myth, having aided the god by his science and knowledge of magic, and demonstrated the justice of his claims in the contest with Set. Thoth presided over writing, measuring and calculation, and is prominent in the scene of the weighing of the soul. He was often identified with the moon as a divider of time, and in this connexion, during the New Empire, the ape first appears as his sacred animal. Thoth was identified by the Greeks with Hermes, and Hermes Trismegistus (*q.v.*) is a late development of the Egyptian god. Geographically the worship of Thoth in Lower Egypt centred in the Hermopolite nome, contiguous to the Busirite and Mendesian nomes. This was the district anciently called *Zḥwt*, and the god's name *Zḥwty* means simply "him of *Zḥwt*." But Hermopolis Magna in Upper Egypt, now Eshmunain, was a city of greater political importance than Hermopolis in Lower Egypt.

See E. A. W. Budge, *The Gods of the Egyptians*; and specially Egypt: *Ancient*, § *Religion*. (F. Ll. G.)

THOU, JACQUES AUGUSTE DE [Thuanus] (1553–1617), French historian, was the grandson of Augustin de Thou, president of the parlement of Paris (d. 1544), younger son of Christophe de Thou, "first president" of the same parlement, who began to collect a number of books and notes for a history of France which he was never to write (d. 1582), and nephew of Nicolas de Thou, who was bishop of Chartres (1573–1598). In these family surroundings he imbibed a love of letters, a firm and orthodox, though enlightened and tolerant piety, and an attachment to the traditional power of the Crown. At the age of seventeen he began his studies in law, first at Orleans, later at Bourges, where he made the acquaintance of Hotman, and finally at Valence, where he had Cujas for his master and Scaliger as a friend. He was at first intended for the Church; he received the minor orders, and on the appointment of his uncle Nicolas to the episcopate succeeded him as a canon of Notre-Dame. But his tastes led him in a different direction; not content with a knowledge of books, he wished to know the world and men. During a period of ten years he seized every opportunity for profitable travel. In 1573 he accompanied Paul de Foix on an embassy, which enabled him to visit most of the Italian courts; he formed a friendship with Arnaud d'Ossat (afterwards bishop of Rennes and Bayeux and cardinal, d. 1604), who was secretary to the ambassador. In the following year he formed part of the brilliant *cortège* which brought King Henry III. back to France, after his flight from his Polish kingdom. He also visited several parts of France, and at Bordeaux met Montaigne. On the death, however, of his elder brother Jean (April 5, 1579), who was *maître des requêtes* to the parlement, his relations prevailed on him to leave the Church, and he entered the parlement and married (1588). In the same year he was appointed *conseiller d'état*. He served faithfully both the effeminate, bigoted and cruel Henry III. and Henry IV., a sceptic and given to love-intrigues, because they were both the representatives of legitimate authority. He succeeded his uncle Augustin as *président à mortier* (1595), and used his new authority in the interests of religious peace, negotiating, on the one hand, the Edict of Nantes with the Protestants, while in the name of the principals of the Gallican Church he opposed the recognition of the Council of Trent. This attitude exposed him to the animosity of the League party and of the Holy See, and to their persecution when the first edition of his history appeared. This history was the work of his whole life. In a letter of the 31st of March 1611 addressed to the president Jeannin, he himself describes his long labours in preparation of it. His materials for writing it were drawn from his rich library, which he established in the Rue des Poitevins in the year 1587, with the two brothers, Pierre and Jacques Dupuy, as librarians. His object was to produce a purely scientific and unbiassed work, and for this reason he wrote it in Latin, giving it as title *Historia sui temporis*. The first 18 books, embracing the period from 1545–1560, appeared in 1604 (1 vol. folio), and the work was at once attacked by those whom the author himself calls *les envieux et les factieux*. The second part, dealing with the first wars of religion (1560–1572), was put on the *Index librorum prohibitorum*

(Nov. 9, 1609). The third part (up to 1574), and the fourth (up to 1584), which appeared in 1607 and 1608, caused a similar outcry, in spite of de Thou's efforts to remain just and impartial. He carried his scruples to the point of forbidding any translation of his book into French, because in the process there might, to use his own words, "be committed great faults and errors against the intention of the author"; this, however, did not prevent the Jesuit Father Machault from accusing him of being "a false Catholic, and worse than an open heretic" (1614); de Thou, we may say, was a member of the third order of St Francis. As an answer to his detractors, he wrote his *Mémoires*, which are a useful complement to the *History of his own Times*. After the death of Henry IV., de Thou met with another disappointment; the queen-regent refused him the position of first president of the parlement, appointing him instead as a member of the *Conseil des finances* intended to take the place of Sully. This was to him a distinct downfall; he continued, however, to serve under Marie de Medicis, and took part in the negotiations of the treaties concluded at Ste Menehould (1614) and Loudun (1616). He died at Paris on the 7th of May 1617.

Three years after the death of de Thou, Pierre Dupuy and Nicolas Rigault brought out, with pt. v., the first complete edition of the *Historia sui temporis*, comprising 138 books; they appended to it the *Mémoires*, also given in Latin (1620). A hundred years later, an Englishman, Samuel Buckley, published a critical edition, the material for which had been collected in France itself by Thomas Carte (1733). De Thou was treated as a classic, an honour which he deserved. His history is a model of exact research, drawn from the best sources, and presented in a style both elegant and animated; unfortunately, even for the men of the Renaissance, Latin was a dead language; it was impossible for de Thou, for example, to find exact equivalents for technical terms of geography or of administration. As the reasons which had led de Thou to forbid the translation of his monumental history disappeared with his death, there soon arose a desire to make it accessible to a wider public. It was translated first into German. A Protestant pastor, G. Boule, who was afterwards converted to Catholicism, translated it into French, but could not find a publisher. The first translation printed was that of Pierre Du Ryer (1657), but it is mediocre and incomplete. In the following century the abbé Prévost, who was a conscientious collaborator with the Benedictines of Saint-Maur before he became the author of the more profane work *Manon Lescaut*, was in treaty with a Dutch publisher for a translation which was to consist of ten volumes; only the first volume appeared (1733). But competition, perhaps of an unfair character, sprang up. A group of translators, who had the good fortune of being able to avail themselves of Buckley's fine edition, succeeded in bringing out all at the same time a translation in sixteen volumes (De Thou, *Histoire universelle*, Fr. trans. by Le Beau, Le Mascrier, the Abbé Des Fontaines, 1734). As to the *Mémoires* they had already been translated by Le Petit and Des Ifs (1711); in this form they have been reprinted in the collections of Petitot, Michaud and Buchon. To de Thou we also owe certain other works: a treatise *De re accipitraria* (1784), a *Life*, in Latin, of Papyre Masson, some *Poemata sacra*, &c.

For his life may be consulted the recollections of him collected by the brothers Dupuy (*Thvana, sive Excerpta J. A. Thuani per ff. P. P.*, 1669; reprinted in the edition of 1733), and the biographies by J. A. M. Collinson (*The Life of Thuanus*, 1807), and Duntzer, (*De Thou's Leben*, 1837). Finally, see Henry Harrisse, *Le Président de Thou et ses descendants, leur célèbre bibliothèque, leurs armoiries et la traduction française de J.A. Thuani Historiarum sui Temporis* [*sic*] (1905). (C. B.*)

THOUARS, a town of western France, in the department of Deux-Sèvres, on the right bank of the Thouet, 24 m. S. by W. of Saumur on the railway to Bordeaux. Pop. (1906), 5321. A massive stronghold built in the first half of the 17th century by the La Trémoille family, and now used as a prison, stands on a rocky eminence overlooking the river, towards which it has a frontage of nearly 400 ft. The adjoining Sainte-Chapelle dating from the early years of the 16th century is in the Gothic style with Renaissance details, and was built by Gabrielle de Bourbon, wife of Louis II. of La Trémoille. The church of St Médard, rebuilt in the 15th century, preserves a doorway of a previous Romanesque building. That of St Laon (12th and 15th centuries) was formerly attached to an abbey, the buildings (17th century) of which serve as town-hall. It has a fine square tower in the Romanesque style and contains the sculptured tomb of the abbot Nicholas. Remains of the ramparts of the town dating from the 13th century and flanked by huge towers are still to be seen, and a bridge of the same period crosses the Thouet. The manufacture of furniture and wooden shoes, and the preparation of veterinary medicine and lime, are carried on. Wine, livestock and agricultural produce are the chief articles of trade.

Thouars, which probably existed in the Gallo-Roman period, became in the 9th century the seat of powerful viscounts, who in later times were zealous supporters of the English. In 1372 the latter were expelled from the town by Bertrand du Guesclin. In 1563 Charles IX. created Louis III., the head of the family of La Trémoille, duke of Thouars. In 1793 the Vendeans took the town by assault.

THOURET, JACQUES GUILLAUME (1746–1794), French revolutionist, was born at Pont l'Évêque. He was the son of a notary, and became an avocat at the parlement of Rouen. In 1789 he was elected deputy to the states-general by the third estate of Rouen, and in the Constituent Assembly his eloquence gained him great influence. Like so many lawyers of his time, he was violently opposed to the clergy, and strongly supported the secularization of church property. He also obtained the suppression of the religious orders and of all ecclesiastical privileges, and actively contributed to the change of the judiciary and administrative system. He was one of the promoters of the decree of 1790 by which France was divided into departments, and was four times president of the Constituent Assembly. After its dissolution he became president of the court of cassation. He was included in the proscription of the Girondists, whose political opinions he shared, and was executed in Paris. Besides his speeches and reports he wrote an *Abrégé des révolutions de l'ancien gouvernement français* and *Tableau chronologique de l'histoire ancienne et moderne.*

His brother, MICHEL AUGUSTIN THOURET (1748–1810), a physician, was a keen opponent of the ideas of Mesmer and a promoter of vaccination in France.

See F. Aulard, *Les Orateurs de l'assemblée constituante* (2nd ed., Paris, 1905); E. Carette and A. Sanson, *Thouret . . . sa vie, ses œuvres* (1890).

THOUSAND AND ONE NIGHTS. The *Thousand and One Nights*, commonly known in English as *The Arabian Nights' Entertainments*, is a collection of tales written in Arabic, which first became generally known in Europe in the early part of the 18th century through the French translation by Antoine Galland, and rapidly attained universal popularity. In the *Journal asiatique* for 1827, p. 253, von Hammer (J. von Hammer-Purgstall) drew attention to a passage in the *Golden Meadows* of Mas'ūdī (ed. Barbier de Meynard, iv. 89 seq.), written in A.D. 943, in which certain stories current among the old Arabs are compared with "the books which have reached us in translations from Persian, Indian and Greek, such as the book of *Hezār Afsāne*, a title which, translated from Persian into Arabic, means 'the thousand tales.' This book is popularly called The *Thousand and One Nights*, and contains the story of the king and his vizier and of his daughter Shīrazād and her slave girl Dīnāzād. Other books of the same kind are the book of *Ferza and Sīmās*, containing stories of Indian kings and viziers, the book of Sindibād, &c." Von Hammer concluded that the *Thousand and One Nights* were of Persian or Indian origin. Against this conclusion Silvestre De Sacy protested in a memoir (*Mém. de l'acad. des inscr.*, 1833, x. 30 seq.), demonstrating that the character of the book we know is genuinely Arabian, and that it must have been written in Egypt at a comparatively recent date. Von Hammer in reply adduced, in *Journ. as.* (1839), ii. 175 seq., a passage in the *Fihrist* (A.D. 987), which is to the following effect:—

"The ancient Persians were the first to invent tales and make books of them, and some of their tales were put in the mouths of animals. The Ashghanians, or third dynasty of Persian kings, and after them the Sāsānians, had a special part in the development of this literature, which found Arabic translators, and was taken up by accomplished Arabic literati, who edited it and imitated it. The earliest book of the kind was the *Hezār afsāne* or *Thousand Tales*, which had the following origin. A certain Persian king was accustomed to kill his wives on the morning after the consummation of the marriage. But once he married a clever princess called Shahrazād, who spent the marriage night in telling a story which in the morning reached a point so interesting that the king spared her, and asked next night for the sequel. This went on for a thousand nights till Shahrazād had a son, and ventured to tell the king of her device. He admired her intelligence, loved her, and spared her life. In all this the princess was assisted by the king's stewardess Dīnāzād. This book is said to have been written for the princess Ḥomāi (MSS. Ḥomānī), daughter of Bahman. . . . It contains nearly two hundred stories, one story often occupying several nights. I have repeatedly seen the complete book, but it is really a meagre and uninteresting production" (*Fihrist*, ed. Flügel, p. 304).

Persian tradition (in Firdousī) makes Princess Ḥomāi the daughter and wife of Bahman Ardashīr, *i.e.* Artaxerxes I. Longimanus. She is depicted as a great builder, a kind of Persian Semiramis, and is a half-mythical personage already mentioned in the Avesta, but her legend seems to be founded on the history of Atossa and of Parysatis. Firdousī says that she was also called Shahrazād (Mohl v. 11). This name and that of Dīnāzād both occur in what Mas'ūdī tells of her. According to him, Shahrazād was Ḥomāi's mother (ii. 129), a Jewess (ii. 123). Bahman had married a Jewess (i. 118), who was instrumental in delivering her nation from captivity. In ii. 122 this Jewish maiden who did her people this service is called Dīnāzād, but "the accounts," says our author, "vary." Plainly she is the Esther of Jewish story. Tabarī (i. 688) calls Esther the mother of Bahman, and, like Firdousī, gives to Ḥomāi the name of Shahrazād. The story of Esther and that of the original *Nights* have in fact one main feature in common. In the former the king is offended with his wife, and divorces her; in the *Arabian Nights* he finds her unfaithful, and kills her. But both stories agree that thereafter a new wife was brought to him every night, and on the morrow passed into the second house of the women (Esther), or was slain (*Nights*). At length Esther or Shahrazād wins his heart and becomes queen. The issue in the Jewish story is that Esther saves her people; in the *Nights* the gainers are "the daughters of the Moslems," but the old story had, of course, some other word than "Moslems." Esther's foster-father becomes vizier, and Shahrazād's father is also vizier. Shahrazād's plan is helped forward in the *Nights* by Dīnāzād, who is, according to Mas'ūdī, her slave girl, or, according to other MSS., her nurse, and, according to the *Fihrist*, the king's stewardess. The last account comes nearest to Esther ii. 15, where Esther gains the favour of the king's chamberlain, keeper of the women. It is also to be noted that Ahasuerus is read to at night when he cannot sleep (Esther vi. 1). And it is just possible that it is worth notice that, though the name of Ahasuerus corresponds to Xerxes, Josephus identifies him with Artaxerxes I.

Now it may be taken as admitted that the book of Esther was written in Persia, or by one who had lived in Persia, and not earlier than the 3rd century B.C. If now there is real weight in the points of contact between this story and the *Arabian Nights*—and the points of difference cannot be held to outweigh the resemblances between two legends, each of which is necessarily so far removed from the hypothetical common source—the inference is important for both stories. On the one hand, it appears that (at least in part) the book of Esther draws on a Persian source; on the other hand, it becomes probable that the *Nights* are older than the Sāsānian period, to which Lane (iii. 677) refers them.

It is a piece of good fortune that Mas'ūdī and the *Fihrist* give us the information cited above. For in general the Moslems, though very fond of stories, are ashamed to recognize them as objects of literary curiosity. In fact, the next mention of the *Nights* is found only after a lapse of three centuries. Maqrīzī, describing the capital of Egypt, quotes from a work of Ibn Sa'īd (*c.* A.D. 1250), who again cites an older author (Al-Ḳorṭobī), who, in speaking of a love affair at the court of the caliph Al-Āmir (1097–1130), says "what is told about it resembles the romance of Al-Bāṭṭal, or the *Thousand and One Nights*" (*Ḥiṭaṭ*, Būlāq ed., i. 485, ii. 181).

That the *Nights* which we have are not the original translation of the *Hezār Afsāne* is certain, for the greater part of the stories are of Arabian origin, and the whole is so thoroughly Mahommedan that even the princes of remote ages who are introduced speak and act as Moslems. It might be conceived that this is due to a gradual process of modernization by successive generations of story-tellers. But against this notion, which has been entertained by some scholars, Lane has remarked with justice that, much as MSS. of the *Nights* differ from one another in points of language and style, in the order of the tales, and the division into nights, they are all so much at one in essentials that they must be regarded as derived from a single original. There is no trace of a recension of the text that can be looked on as standing nearer to the *Hezār Afsāne*. And the whole local colour of the work, in point of dialect and also as regards the manners and customs described, clearly belongs to Egypt as it was from the 14th to the 16th century. Some points, as De Sacy and Lane have shown, forbid us to place the book earlier than the second half of the 15th century. Galland's MS. copy, again, was in existence in 1548. Lane accordingly dates the work from the close of the 15th century or the beginning of the 16th, but this date appears to be too late. For Abu'l-Maḥāsin, an Egyptian historian who died in 1470, writing of Ḥamdi, a famous highwayman of Bagdad in the 10th century, remarks that he is probably the figure who used to be popularly spoken of as Aḥmad al-Danaf (ed. Juynboll ii. 305). Now in the *Nights* Aḥmad al-Danaf really plays a part corresponding to that of the historical Ḥamdi, being now a robber (Lane ii. 404) and again a captain of the guard (Lane ii. 249). It would seem that Abu'l-Maḥāsin had read or heard the stories in the *Nights*, and was thus led to compare the historical with the fictitious character. And, if this be so, the *Nights* must have been composed very soon after 1450.[1]

No doubt the *Nights* have borrowed much from the *Hezār Afsāne*, and it is not improbable that even in the original Arabic translation of that work some of the Persian stories were replaced by Arab ones. But that our *Nights* differ very much from the *Hezār Afsāne* is further manifest from the circumstance that, even of those stories in the *Nights* which are not Arabian in origin, some are borrowed from books mentioned by Mas'ūdī as distinct from the *Hezār Afsāne*. Thus the story of the king and his son and the damsel and the seven viziers (Lane, ch. xxi. note 51) is in fact a version of the *Book of Sindbād*,[2] while the story of Jalī'ād and his son and the vizier Shammās (M'Naghten iv. 366 seq.; cf. Lane iii. 530) corresponds to the book of *Ferza and Sīmās*.[3]

Not a few of the tales are unmistakably of Indian or Persian origin, and in these poetical passages are rarely inserted. In other stories the scene lies in Persia or India, and the source is foreign, but the treatment thoroughly Arabian and Mahommedan. Sometimes, indeed, traces of Indian origin are perceptible, even in stories in which Hārūn al-Rashīd figures and the scene is Bagdad or Baṣra.[4] But most of the tales, in substance and form alike, are Arabian, and so many of them have the capital of the caliphs as the scene of action that it may be guessed that the author used as one of his sources a book of tales taken from the era of Bagdad's prosperity.

The late date of the *Nights* appears from sundry anachronisms. In the story of the men transformed into fish—white, blue, yellow or red according as they were Moslems, Christians, Jews or Magians (Lane i. 99)—the first three colours are those of

[1] The hypothesis of gradual and complete modernization is also opposed to the fact that the other romances used by Cairene story-tellers (such as those of 'Antar and of Saïf) retain their original local colour through all variations of language and style.

[2] The Syriac *Sindibān*, the Greek *Syntipas*, and the *Seven Sages* of the European West.

[3] De Sacy and Lane suppose that the original title of the Arabic translation of the *Hezār Afsāne* was *The Thousand Nights*. But most MSS. of Mas'ūdī already have *The Thousand and One Nights*, which is also the name given by Maqrīzī. Both ciphers perhaps mean only "a very great number," and Fleischer (*De glossis Habichtianis*, p. 4) has shown that 1001 is certainly used in this sense.

[4] Gildemeister, *De rebus indicis*, p. 89 seq.

the turbans which, in 1301, Mahommed b. Kala'un of Egypt commanded his Moslem, Christian and Jewish subjects respectively to wear.[1] Again, in the story of the humpback, whose scene is laid in the 9th century, the talkative barber says, "this is the year 653" (= A.D. 1255; Lane, i. 332, writes 263, but see his note), and mentions the caliph Mostanṣir (d. 1242), who is incorrectly called son of Mostaḍī.[2] In the same story several places in Cairo are mentioned which did not exist till long after the 9th century (see Lane i. 379).[3] The very rare edition of the first 200 nights published at Calcutta in 1814 speaks of cannon, which are first mentioned in Egypt in 1383; and all editions sometimes speak of coffee, which was discovered towards the end of the 14th century, but not generally used till 200 years later. In this and other points, *e.g.* in the mention of a mosque founded in 1501 (Lane iii. 608), we detect the hand of later interpolators, but the extent of such interpolations can hardly perhaps be determined even by a collation of all copies. For the nature and causes of the variations between different copies the reader may consult Lane, iii. 678, who explains how transpositions actually arise by transcribers trying to make up a complete set of the tales from several imperfect copies.

Many of the tales in the *Nights* have an historical basis, as Lane has shown in his notes. Other cases in point might be added: thus the chronicle of Ibn al-Jauzī (d. A.D. 1200) contains a narrative of Ḳamar, slave girl of Shaghb, the mother of Moqtadir, which is the source of the tale in Lane i. 310 seq., and of another to be found in M'Naghten iv. 557 seq.; the latter is the better story, but departs so far from the original that the author must have had no more than a general recollection of the narrative he drew on.[4] There are other cases in the *Nights* of two tales which are only variations of a single theme, or even in certain parts agree almost word for word. Some tales are mere compounds of different stories put together without any art, but these perhaps are, as Lane conjectures, later additions to the book; yet the collector himself was no great literary artist. We must picture him as a professional story-teller equipped with a mass of miscellaneous reading, a fluent power of narration, and a ready faculty for quoting, or at a push improvising, verses. His stories became popular, and were written down as he told them—hardly written by himself, else we should not have so many variations in the text, and such insertions of "the narrator says," "my noble sirs," and the like. The frequent coarseness of tone is proper to the condition of Egyptian society under the Mameluke sultans, and would not have been tolerated in Bagdad in the age to which so many of the tales refer. Yet with all their faults the *Nights* have beauties enough to deserve their popularity, and to us their merit is enhanced by the pleasure we feel in being transported into so entirely novel a state of society.

The *Thousand and One Nights* became known in Europe through A. Galland's French version (12 vols. 12mo, Paris, 1704–1712); the publication was an event in literary history, the influence of which can be traced far and wide. This translation, however, left much to be desired in point of accuracy, and especially failed to reproduce the colour of the original with the exactness which those who do not read merely for amusement must desire. It was with a special view to the remedying of these defects that E. W. Lane produced in 1840 his admirably accurate, if somewhat stilted, translation, enriched with most valuable notes and a discussion of the origin of the work (new edition, with some additional notes, 3 vols. 8vo, London, 1859). Lane's translation omits the tales which he deemed uninteresting or unfit for a European public. Sir Richard Burton's unexpurgated English translation, with elaborate notes, was issued in 10 vols., 1885–1886, with six supplementary vols., 1887–1888. A new French version (1899 seq.) was undertaken by J. C. Mardrus. Of the Arabic text of the *Nights* the principal editions are—(1) M'Naghten's edition (4 vols. 8vo, Calcutta, 1839–1842); (2) the Breslau edition (12 vols., 12mo, 1835–1843), the first 8 vols. by Habicht, the rest by Fleischer (compare as to the defects of Habicht's work, Fleischer, *De glossis Habichtianis.* Leipzig, 1836); (3) the first Būlāq edition (4 vols., 1862–1863). See the *Bibliographie des ouvr. arabes* (1901), vol. iv., by V. Chauvin, (M. J. DE G.)

THRACE, a name which was applied at various periods to areas of different extent. For the purposes of this article it will be taken in its most restricted sense, as signifying the Roman province which was so called after the district that intervened between the river Ister (Danube) and the Haemus Mountains (Balkan) had been formed into the separate provinces of Moesia, and the region between the rivers Strymon and Nestus, which included Philippi, had been added to Macedonia. The boundaries of this were—towards the N. the Haemus, on the E. the Euxine Sea, on the S. the Propontis, the Hellespont and the Aegean, and towards the W. the Nestus. The most distinguishing features of the country were the chain of Rhodope (Despoto-dagh) and the river Hebrus (Maritza). The former separates at its northernmost point from the Haemus, at right angles, and runs southward at first, nearly parallel to the Nestus, until it approaches the sea, when it takes an easterly direction (See Virg. *Georg.* iii. 351). Several of the summits of this chain are over 7000 ft. in height. The Hebrus, together with its tributaries which flow into it from the north, east and west, drains almost the whole of Thrace. It starts from near the point of junction of Haemus and Rhodope, and at first takes an easterly direction, the chief town which lies on its banks in the earlier part of its course being Philippopolis; but when it reaches the still more important city of Hadrianopolis it makes a sharp bend towards the south, and enters the sea nearly opposite the island of Samothrace. The greater part of the country is hilly and irregular, though there are considerable plains; but besides Rhodope two other tolerably definite chains intersect it, one of which descends from Haemus to Adrianople, while the other follows the coast of the Euxine at no great distance inland. One district in the extreme north-west of Thrace lay beyond the watershed separating the streams that flow into the Aegean from those that reach the Danube: this was the territory of Sardica, the modern Sophia. In the later Roman period two main lines of road passed through the country. One of these skirted the southern coast, being a continuation of the Via Egnatia, which ran from Dyrrhachium to Thessalonica, thus connecting the Adriatic and the Aegean; it became of the first importance after the foundation of Constantinople, because it was the direct line of communication between that city and Rome. The other followed a north-westerly course through the interior, from Constantinople by Hadrianopolis and Philippopolis to the Haemus, and thence by Naissus (Nish) through Moesia in the direction of Pannonia, taking the same route by which the railway now runs from Constantinople to Belgrade. The climate of Thrace was regarded by the Greeks as very severe, and that country was spoken of as the home of the north wind, Boreas. The coast in the direction of the Euxine also was greatly feared by sailors, as the harbours were few and the sea proverbially tempestuous; but the southern shore was more attractive to navigators, and here we find the Greek colonies of Abdera and Mesambria on the Aegean, Perinthus on the Propontis, and, the most famous of all, Byzantium, at the meeting-point of that sea and the Bosporus. Another place which proved attractive to colonists of that race was the curious narrow strip of ground, called the Thracian Chersonese, that intervened between the Hellespont and the Bay of Melas, which penetrates far into the land on its northern side. Among the cities that occupied it the most important were Sestos and Callipolis (Gallipoli). In order to prevent the incursions of the Thracians, a wall was built across its isthmus, which was less than 5 m. in breadth. The north-eastern portion of the Aegean, owing to its proximity to the coast of Thrace, was known as the Thracian Sea, and in this were situated the islands of Thasos, Samothrace and Imbros.

History.—The most striking archaeological monuments of the prehistoric period are the sepulchral mounds, which are found by thousands in various parts of the country, especially in the neighbourhood of the ancient towns. As Roman implements and ornaments have been found in some of them, it is plain that this mode of burial continued to be practised until a late period. The country was overrun several times by Darius and his generals, and the Thracian Greeks contributed 120 ships to the armament of Xerxes (Herod. vii. 185). The most powerful Thracian tribe was that of the Odrysae, whose king, Teres, in the middle of the 5th century B.C. extended his dominion so as to include the greater part of Thrace. During the Peloponnesian War his son Sitalces was an ally of some importance to the Athenians, because he kept in check the Macedonian monarch, who opposed the interests of the Athenians in the Chalcidic peninsula. Again, in the time of Philip of Macedon we find Cersobleptes, who ruled the south-eastern portion of the country, exercising an important influence on the policy of Athens. During the early period of the Roman Empire the Thracian kings were allowed to maintain an independent sovereignty, while acknowledging the suzerainty of Rome, and it was not until the reign of Vespasian that the country was reduced to the form of a province (Kalopathakas, *De Thracia, provincia romana*, 1894; Mommsen, *Roman Provinces*, Eng. trans., 1886). From its outlying position in the northern part of the Balkan peninsula it was much exposed to the inroads of barbarian invaders. It was overrun by the Goths on several occasions, and subsequently by the Huns; but its proximity to Constantinople caused its fortunes to be closely connected with those of that city, from the time when it became the capital of the Eastern Empire. In the course of the middle ages the northern parts of Thrace and some other districts of that country were occupied by a Bulgarian population; and in 1361 the Turks made themselves masters of Adrianople, which for a time became the Turkish capital. When Constantinople fell in 1453 the whole country passed into the hands of the Turks, and in their possession it remained until 1878, when, in accordance with the provisions of the Treaty of Berlin, the northern portion of it was placed under a separate administration, with the title of Eastern Rumelia; this province has now become, to all intents and purposes, a part of the principality of Bulgaria. The population is composed of Turks, Greeks and Bulgarians. (H. F. T.)

Ancient Peoples.—The name "Thracians," from being used both ethnically and geographically, has led to confusion. There were the true indigenous Thracians and also Celtic tribes such as the Treres in the early period, the Getae and Trausi later, and the Gallic Scordisci in Roman days. These were the "red" Thracians of Greek writers, and they differed not merely in physique and complexion, but also in their customs and religion from the native Thracians (Herod. v. 14). The native Thracians were inferior in morals, allowing their girls complete licence till marriage. The chief native deities were Dionysus, Ares and Bendis (Artemis), but many of these tribes had Celtic chiefs, who traced their descent from and worshipped a god called Hermes by the Greeks, but possibly Odin. The substantial features of the ancient Dionysiac rites, including a ritual play by "goat-men" carrying a wooden phallus, may still be seen at Bizye, the old residence of the Thracian kings (see R. M. Dawkins in *Hellenic Journal*, 1906, p. 191). The true Thracians were part of that dark-complexioned, long-skulled race, which had been in the Balkan peninsula from the Stone Age, closely akin to the Pelasgians (*q.v.*), the aborigines of Greece, to the Ligurians, the aborigines of Italy, and to the Iberians. The name "Illyrian" (see ILLYRIA) was applied to all the tribes of this stock who dwelt west of the northern extensions of the Pindus range and in what was termed Upper Macedonia in later times, and who extended right up to the head of the Adriatic. In Homer the name Macedonia is not yet known, and the term Thracian is applied to all the tribes dwelling from Pieria to the Euxine. There is no well-defined difference between aboriginal Thracians and Illyrians. Thus there was an Illyrian tribe Brygi, a Thracian one Bryges; some of the latter had passed into Asia and settled in the land called from them Phrygia, whence some of them later passed into Armenia; some of the Mysians (regarded by Strabo as Thracians) had also crossed into what was later known as Mysia: closely connected with the Mysians were the Dardanii, of Trojan fame, who had a city Dardania or Dardanus. In Strabo's time a tribe called Dardanii, then reckoned Illyrian, living next the Thracian Bessi (in whose land was the oldest oracle of Dionysus), were probably as much Thracian as Illyrian. All the Thracian and Illyrian tribes tattooed, thus being distinguished from the Celtic tribes who had conquered many of them. The Thracians differed only dialectically from the Illyrians (Strabo), their tongue being closely allied to Greek. The Thracians of the region from Olympus to the Pangaean district, usually regarded as rude tribes, had from a very early time worked the gold and silver of that region, had begun to strike coins almost as early as the Greeks, and displayed on them much artistic skill and originality of types. The most famous were the Bisaltae, the Orrescii, Odomantes and Edoni. Alexander I. of Macedon on his conquest of the Bisaltae adopted the native coinage, merely placing on it his own name (see, further, NUMISMATICS: *Greek*, §§ *Thrace* and *Macedonia*). They were famous for their skill in music and literature. Orpheus, Linus, Thamyris and Eumolpus were theirs, and in later days the Dardanii were noted for their love of music as well as for their uncleanliness.

See Herodotus v. 3–8; H. Kiepert, *Lehrbuch der alten Geographie* (Berlin, 1878); A. Boué, *La Turquie d'Europe* (4 vols., Paris, 1840); G. Finlay, *History of Greece*, vols. i.–iv. (Oxford, 1877); W. Ridgeway, *Early Age of Greece*, i. 351 seq. (Cambridge, 1902); Tomaschek, *Die alten Thraker* (1893–1895); Hiller von Gaertringen, *De Graecorum fabulis ad Thraces pertinentibus* (1886). (W. RI.)

THRALL, a slave, a captive or bondman, a term especially applied to the serfs (Lat. *servi*) of the early northern Teutonic peoples. It only occurs in Old English as a word borrowed from the Norse, the proper term in Old English being "theow" (*þeow*); the Icel. *þraell* (Dan. *trael*, Swed. *träl*) is probably represented by O. H. Ger. *dregil*, *trigil*, *trikil*, a slave, and would therefore be derived from the root meaning "to run," seen in O. Eng. *þraegian*, Goth. *thagjan*, cf. Gr. τρέχειν; Skeat (*Etym. Dict.*, 1898) compares the "trochilus" (Gr. τροχίλος), the small bird that according to Herodotus waits or attends on the crocodile and picks insects out of his teeth.

THRASEA PAETUS, PUBLIUS CLODIUS, Roman senator and Stoic philosopher, lived during the reign of Nero. He was the husband of Arria the daughter of Arria (*q.v.*), father-in-law of Helvidius Priscus, and a friend and kinsman of the poet Persius. He was born at Patavium, and belonged to a distinguished and wealthy family. The circumstances under which he came to settle in Rome are unknown. At first he was treated with great consideration by Nero, probably owing to the influence of Seneca, and became consul in A.D. 56 and one of the keepers of the Sibylline books. In 57 he supported in the senate the cause of the Cilician envoys, who came to Rome to accuse their late governor, Cossutianus Capito, of extortion. In 59 Thrasea first openly showed his disgust at the behaviour of Nero and the obsequiousness of the senate by retiring without voting after the emperor's letter justifying the murder of Agrippina had been read. In 62 he prevented the execution of the praetor Antistius, who had written a libel upon the emperor, and persuaded the senate to pass a milder sentence. Nero showed his displeasure by refusing to receive Thrasea when the senate went in a body to offer its congratulations on the birth of a princess. From this time (63) till his death in 66 Thrasea retired into private life and did not enter the senate-house again. But his death had been decided upon. The simplicity of his life and his adherence to Stoic principles were looked upon as a reproach to the frivolity and debaucheries of Nero, who "at last yearned to put Virtue itself to death in the persons of Thrasea and Soranus" (Tacitus). Cossutianus Capito, the son-in-law of Tigellinus, who had never forgiven Thrasea for securing his condemnation, and Eprius Marcellus undertook to conduct the prosecution. Various charges were brought against him, and the senate, awed by the presence of large bodies of troops, had no alternative but to condemn him to death. When the news was brought to Thrasea at his house, where he was entertaining a number of friends, he retired to his chamber, and had the veins of both his arms opened. The narrative of Tacitus breaks off at the moment when Thrasea was about to address Demetrius, the Cynic philosopher, with whom he had previously on the fatal day held a conversation on the nature of the soul. Thrasea was the subject of a panegyric by Arulenus Rusticus, one of the tribunes, who had offered to put his veto on the decree of the senate, but Thrasea refused to allow him to throw his life away uselessly. Thrasea's own model of life and conduct was Cato of Utica, on whom he had written a panegyric, one of Plutarch's chief authorities in his biography of Cato.

See Tacitus, *Annals* (ed. Furneaux), xiii. 49, xiv. 12, 48, xv. 20–22, xvi. 21–35, containing a full account of his trial and condemnation, *Hist.* ii. 91, iv. 5; Dio Cassius lxi. 15, lxii. 26; Juvenal v. 36; W. A. Schmidt, *Geschichte der Denk- und Glaubensfreiheit* (Berlin, 1847); Merivale, *Hist. of the Romans under the Empire*, ch. 53; F. Hersche, *Zwei Characterbilder*, on Diogenes of Sinope and Paetus (Lucerne, 1865); monographs by A. S. Hoitsema (Groningen, 1852); and G. Joachim (Lahr, 1858); see also Pauly-Wissowa's *Realencyclopädie der classischen Altertumswissenschaft* (1900), iv. pt. 1.

THRASHING, or Threshing (from "to thrash," O. Eng. *þerscan*, cf. Ger. *dreschen*, Du. *dorschen*, &c.), the process by which the grain or seed of cultivated plants is separated from the husk or pod which contains it.

Historical.—It is probable that in the earliest times the little grain that was raised was shelled by hand, but as the quantity increased doubtless the grain was beaten out with a stick or the sheaf beaten upon the ground. An improvement on this, as the quantity further increased, was the practice of the ancient Egyptians and Israelites of spreading out the loosened sheaves on a circular enclosure of hard ground 50 to 100 ft. in diameter, and driving oxen, sheep or other animals round and round over it so as to tread out the grain. This enclosure was placed on an elevated piece of ground so that when the straw was removed the wind blew away the chaff and left the corn. This method, however, damaged part of the grain, and as civilization advanced it was partially superseded by the thrashing sledge—the *charatz* of Egypt and the *morag* of the Hebrews—a heavy frame mounted with three or more rollers, sometimes spiked, which revolved as it was drawn over the spread out corn by two oxen. A common sledge with a ridged or grooved bottom was also used. Similar methods to these were used by the Greeks and are still employed in backward countries. In Italy a tapering roller fastened to an upright shaft in the centre of the thrashing floor and pulled round from the outer end by oxen is still in vogue and would seem to be a descendant of the Roman *tribulum* or roller sledge.

Doubtless the flail was evolved from the early method of using the stick. It seems to have been the thrashing implement in general use in all Northern European countries, and was the chief means of thrashing grain as late as 1860. It was known to the Japanese from the earliest times, and was probably used in conjunction with the stripper, an implement fashioned very much like a large comb, with the teeth made of hard wood and pointing upwards. The straw after being reaped was brought to this and combed through by hand, the heads being drawn off and afterwards thrashed on the thrashing floor by the flail. At the present day just such an implement, known as a "heckle," is used for combing the bolls or heads off flax or for straightening the fibre in the after treatment.

The flail consisted of two pieces of wood, the handstaff or helve and the beater, fastened together loosely at one end by a thong of raw hide or eelskin, which made a very durable join. The handstaff is a light rod of ash about 5 ft. long, slightly increasing in girth at the farther end to allow for the hole for the thong to bind it to the beater. The length of the handstaff enabled the operator to stand in an upright position while working. The beater is a wooden rod about 30 in. long, made of ash, though a more compact wood such as thorn is less likely to split. This also has a hole at one end for the thong to bind it to the handstaff. The shape of the beater was cylindrical, of about $1\frac{1}{2}$ in. diameter and constructed so that the edge of the grain of the wood received the force of the blow; 30 to 40 blows or strokes per minute was the average speed.

After the grain had been beaten out by the flail or ground out by other means the straw was carefully raked away and the corn and chaff collected to be separated by winnowing when there was a wind blowing. This consisted of tossing the mixture of corn and chaff into the air so that the wind carried away the chaff while the grain fell back on the thrashing floor. The best grain fell nearest while the lightest grain was carried some distance before falling, thus a very rough-and-ready grading of the grain was obtained. It was also performed when there was no wind by fanning while pouring the mixture from a vessel. Later on a fanning or winnowing mill was invented. All ancient barns were constructed with large doors giving on to the thrashing floor and opening in the direction of the prevailing winds so that the wind could blow right through the barn and across the thrashing floor for the purpose of winnowing the corn. The flail is still in use for special purposes such as flower seeds and also where the quantity grown is so small as to render it not worth while to use a thrashing mill.

With regard to the amount of grain thrashed in a day by the flail, a fair average quantity was 8 bushels of wheat, 30 bushels of oats, 16 bushels of barley, 20 bushels of beans, 8 bushels of rye and 20 bushels of buckwheat.

There seem to have been many attempts to devise some form of power-driven machinery for thrashing. In 1732 Michael Menzies, a Scotsman, obtained a patent for a power-driven machine. This was a contrivance arranged to drive a large number of flails operated by water power, but though worked for a time it was not particularly successful. The first practical effort leading in the right direction was made by a Scottish farmer named Leckie about 1758. He invented what was described as a "rotary machine consisting of a set of cross arms attached to a horizontal shaft and enclosed in a cylindrical case." This machine did not work very well, but it demonstrated the superiority of the rotary motion and pointed out the lines on which thrashing machines should be constructed.

The first really successful thrashing machine—the type which is embodied in modern thrashers—was invented by another Scotsman named Andrew Meikle in 1786 In this the loosened sheaves were fed, ears first, from a feeding board between two fluted revolving rollers to the beating cylinder. This cylinder or "drum" was armed with four iron-shod beaters or spars of wood parallel to its axle, and these striking the ears of corn as they protruded from the rollers knocked out the grain. The drum revolved at 200 to 250 revolutions per minute and carried the loose grain and straw on to a concave sieve beneath another revolving drum or rake with pegs which rubbed the straw on to the concave and caused the grain and chaff to fall through. Another revolving rake tossed the straw out of the machine. The straw thus passing under one peg drum and over the next was subjected to a thorough rubbing and tossing which separated the grain and chaff from it. These fell on to the floor beneath, ready for winnowing.

A later development of the beater-drum was to fix iron pegs on the framework, and thus was evolved the Scottish "peg-mill," which remained the standard type for nearly a hundred years and is found at nearly every farmstead in Scotland as a fixed machine in the barn to the present day, though in many cases unused since the advent of the portable thrasher. Further, it is the type adopted in America, and all "separators" in use on the great wheat lands of "the West" are simply modifications of the peg-mill principle. In Great Britain, however, a reversion has been made to the beating or rubbing principle, where the arms of the "drum" rub the straw against an encircling concave framework and thus shell the grain out, and the portable thrashing machines now taken from farm to farm are all constructed on this principle. It was not till about 1800 that a machine for winnowing was invented to work as part of Meikle's peg-drum thrasher, and this made a complete separator or thrasher which thrashed, cleaned and delivered the grain at one operation. Still, these machines were stationary, being generally built up in homesteads and operated by water power, and the unthrashed corn had to be brought to them. Portable thrashing machines operated by horse power were used to a small extent, but the work was very hard on the horses and took them away when their services were otherwise required on the farm. When steam was developed as a motive power the portable thrashing machine became more general.

When Meikle had brought together the peg-drum and concave he had solved the difficulty of mechanical thrashing. The development of the machine to the efficiency of the modern thrasher was very gradual, and was in the direction of greater speed to the drum and more beaters on it, and improved arrangements to ensure a clean sample of grain. It is generally supposed that each part was invented and perfected singly, but in reality the early experimenters had tried to make a complete separating machine. In fact they covered the whole ground in theory before any main features were made practical.

The Modern Thrashing Machine.—The present-day thrashing machine embodies the main features of Meikle's machine and will thrash up to 16 quarters of oats per hour, depending on the size of the same. There are no fluted rollers at the feed, the sheaves are fed straight to the drum; but as the working of these high-speed drums was attended with considerable risk, the Threshing Machine Act 1878 now provides for some sort of guard or safety feed.

In the most modern thrashing machine the ordinary routine is as follows: The loosened sheaf is fed in at the feed mouth under the drum guard and passes between the drum beaters and the concave; most of the corn falls through the concave on to the corn and chaff receiving board, but some of the corn and chaff remain among the straw; as the "cavings" (the short broken straw and leaf) need to be separated from the straw it is given a thorough tossing up on the shakers, which have an upwards and onwards peristaltic action, and deliver the straw at the end of the machine. The corn, chaff and cavings fall on to a reciprocating board or "upper shoe," which carries them back to the middle

of the machine, where they meet the corn that fell through the concave. The upper shoe passes the cavings, &c., over the end into a "lower shoe," which thoroughly sifts the corn and chaff from the cavings. The cavings are then carried along to the outside of the machine and emerge at an opening beneath the point where the straw passes out. The corn and chaff fall through the lower shoe or caving riddle on to a receiving board

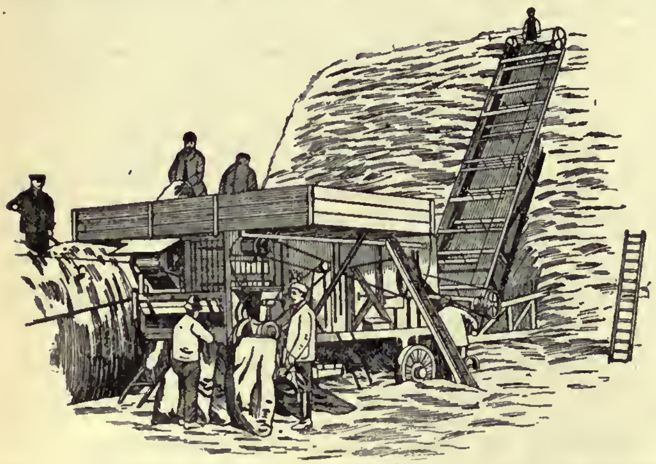

FIG. 2.—Thrashing Machine at work with stacking elevator behind. (Clayton & Shuttleworth, Lincoln.)

which takes them back to the middle of the machine, where they fall, meeting with a strong blast of wind from the first fan, which blows out the chaff and light matter, the small seeds and light dust being sifted out through finely perforated sieves, while larger débris such as thistle heads and "chobs" (broken heads) are taken off by a coarse sieve. The corn then passes into the shaker shoe, which is fitted with sieves to take off the larger seed, and thence to the elevator, which carries it to the top of the machine in a roughly dressed condition. The elevator delivers the corn into the awner or "hummeller," which is fitted with helical blades to rub off the awns or beards which may still adhere to the grain. From here the grain falls on to a second series of sieves, where it meets the blast of air from the second fan, which blows and sifts the light and coarse foreign matter from the grain, delivering this débris on the first corn and chaff receiving board to undergo separation again along with that just fallen from the concave. The corn falls from the sieve of this second dresser into a rotary screen where separations are made producing the clean sample and the tail corn, which are delivered at separate openings below. There are modifications on the machine described—such as single fan-blast instead of double, &c.—but the general principles are the same.

The concave which surrounds the drum is made adjustable, so that it can be regulated according to the nature of the crop to be thrashed. An ordinary machine will thrash all usual farm crops, but great care has to be taken in adjusting the concave or the seed will be injured. Clover, however, is twice

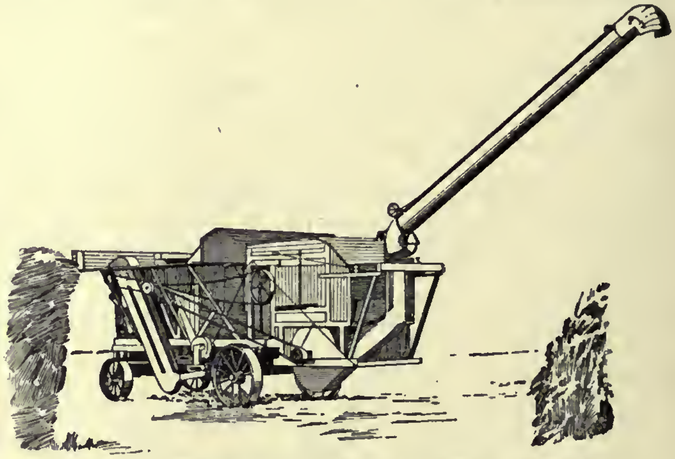

FIG. 3.—Thrashing Machine with fan-blast straw-stacker. (Clayton & Shuttleworth, Lincoln.)

passed through a machine of this description, to free the seed from the haulm and afterwards to rub the seed clear from the chaff, but special machines to thrash it all in one operation are made.

The drum is carried on the main shaft and all other pulleys take their motion from it directly or indirectly. Sometimes the main shaft is lengthened to accommodate another pulley and so drive a chaff-cutter behind and chaff up the straw as it leaves the thresher. In some districts an elevator is driven behind to stack the straw. Others use a trusser, which ties the straw into large bundles before delivering it for stacking.

American Machines.—In American machines the straw, cavings, &c., are caught in a blast at the rear end of the machine and blown up in a light iron pipe of about 18 in. diameter on to the top of the stack, and the grain is delivered loose at the side through a spout into a box wagon. As the payment for thrashing is per bushel the grain is usually passed through a self-registering weighing apparatus, so that accurate account is kept of the bushels thrashed. In Great Britain payment is per quarter of 8 bushels, and as the machine delivers into 4-bushel

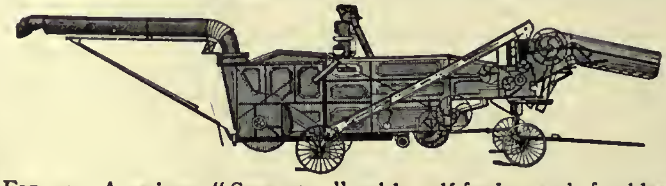

FIG. 4.—American "Separator" with self-feeder and fan-blast delivery-pipe for straw. (Avery Manufacturing Co., Peoria, Illinois.)

sacks this rough-and-ready measure is accepted. On American machines self-feeders are adopted, in which the sheaves are thrown on to a travelling web which carries them under revolving knives to cut the bands and deliver them loose into the drum, so that while many more bushels of grain are passed per day through an American machine than is done in Great Britain, only about half the men are required at the work.

Thrashing Work.—The minimum number of hands required in Great Britain are: An engine-driver, a feeder, a sackman, and ten other men to handle the sheaves, straw, chaff, grain, &c., while half as many more may be needed where the grain has to be carted, as when the thrashing is done in the field in harvest time. An 8-h.p. steam engine is the usual motive power, but the development of the oil engine has provided a very satisfactory substitute. The engine is usually of the "traction" type, so that it can move the thrashing machine or "barn work" (as it is sometimes called) and elevator from place to place. The usual quantities thrashed with a "double blast finishing machine," as described, in the United Kingdom are, with a 5 ft. wide drum, from 60 to 80 bushels per hour of wheat, and one-third to one-half more of oats and barley.

Sometimes the straw is stacked loose, while sometimes it is tied up with twine by a tier exactly like that on a "string binder" and then stacked up. Where all the straw is used at the farm for fodder, &c., the fixed thrashing machine set up in the barn is the most convenient. The sheafed corn has to be carried to it, but, on the other hand, everything is under cover, the work can be done on a wet day, and all the products of thrashing in the shape of grain, straw, cavings, chaff, &c., are kept dry. In the great corn districts, however, the portable thrasher is most convenient; it is set alongside the stack and only the grain and chaff are carried under cover, while the thrashed straw, &c., is restacked up on the spot as the work goes on. The farmer finds the coal and the men and horses to cart water to the engine and corn to the barn and pays the proprietor of the thrashing outfit, who finds all the other men, about the following rates: wheat, 1s. 10d., oats and barley, 1s. 6d. per quarter. (P. McC.)

THRASYBULUS, an Athenian general, whose public career began in 411 B.C., when by his resolute behaviour he frustrated the oligarchic rising in Samos (see PELOPONNESIAN WAR), and secured the Athenian armament to the cause of democracy. Elected general by the troops, he effected the recall of Alcibiades and assisted him in the ensuing naval campaigns. By his brave defence at Cynossema (411) he won the battle for Athens, and in 410 contributed towards the brilliant victory of Cyzicus. In 406 he fought at Arginusae as a simple ship's captain, but after the engagement was commissioned with Theramenes (*q.v.*) to rescue some drowning crews. In the subsequent inquiry Thrasybulus successfully disclaimed responsibility for the failure.

In 404, when exiled by the Thirty Tyrants for his services to the democracy, he retired to Thebes and there prepared for a desperate attempt to recover his country. Late in the year, with seventy men, he seized Phyle, a hill fort on Mt Parnes. A force sent by the Thirty was repulsed and routed by a surprise attack. Thrasybulus now gained the Peiraeus, 1000 strong, and successfully held the steep hill of Munychia against the oligarchs' full force. After this repulse the Thirty gave way to a provisional government of moderate oligarchs. Meanwhile a Spartan fleet, which the latter had summoned, blockaded the Peiraeus, but king Pausanias, commanding the land forces, after some skirmishes effected a general reconciliation by which the democracy was restored (October 403). Thrasybulus was now the hero of the people; but a decree by which he secured the franchise for all his followers, including many slaves, was rescinded as illegal.

In 395 Thrasybulus induced Athens to join the Theban league against Sparta, but did not himself take the field till 389, when he led a new fleet of 40 ships against the Spartans at Rhodes. Sailing first to the Bosporus he effected a democratic revolution at Byzantium and renewed the corn-toll. After a successful descent on Lesbos and the renewal of the 5% import tax at Thasos and Clazomenae he sailed south in quest of further contributions, but met his death in a night surprise by the people of Aspendus. By his exactions he had forfeited the confidence both of the allies and of Athens; but after his death the ill-feeling subsided, and he was ever remembered as one of the saviours of his country.

See Thucydides, viii. 75–105; Xenophon, *Hellenica*; Lysias, *c. Eratosth.* 55–61 and *c. Ergocl.* 5, 8; and *Const. ath.* xl. Diodorus xiii., xiv., Justin v. 9, 10, and Nepos depend almost wholly on Xenophon. *Corpus inscr. att.* ii. 11b and 14b. (M. O. B. C.)

THRASYMEDES, of Paros, a Greek sculptor. Formerly he was regarded as a pupil of Pheidias, because he set up in the temple of Asclepius at Epidaurus a seated statue of that deity made of ivory and gold, which was evidently a copy of the Zeus of Pheidias. But an inscription recently found at Epidaurus proves that the temple and the statue belong to the fourth century. (See EPIDAURUS.)

THREAD (O. Eng. *þræd*, literally, that which is twisted, *þrawan*, to twist, to throw, cf. "throwster," a silk-winder, Ger. *drehen*, to twist, turn, Du. *draad*, Ger. *Draht*, thread, wire), a thin or fine cord of two or more yarns of fibrous substance, such as cotton, silk, wool or flax, tightly twisted together (see SPINNING and COTTON AND COTTON MANUFACTURE). Thread, whether as silk or cotton thread, is particularly used for sewing, but it is also used in weaving. Lisle thread, a hard-twisted linen thread, originally made at Lille in France, is specially used in the manufacture of stockings (see HOSIERY). Apart from the figurative sense of that which runs through the course of a subject, narrative or speech, as a connecting thought, idea or purpose, the term is also applied specifically to the spiral part of a screw (*q.v.*).

THREAT, a menace or intimidation. At common law the employment of threats or other forms of intimidation to induce a person to enter into a contract will give the right to sue for its recision or avoidance, or to plead the special form of intimidation in answer to any action brought, or to sue for damages occasioned by entering into the contract. (See such headings as COERCION; CONTRACT; EXTORTION, &c.)

In criminal law the sending of threatening letters (or causing them to be received), demanding with menaces and without reasonable cause money or other valuable thing, is a felony. So is the sending a letter threatening to burn or destroy any house, barn or other building or to kill or maim cattle. It is also a felony to threaten to accuse a person of a crime for the purpose of extorting money, or merely to demand money or other property, without having any claim to it, by means of a threat.

THREE BODIES, PROBLEM OF, the problem of determining the motion of three bodies moving under no influence but that of their mutual gravitation. No general solution of this problem is possible. As practically attacked it consists in the problem of determining the perturbations or disturbances in the motion of one of the bodies around the principal or central body, produced by the attraction of the third. Examples are the motion of the moon around the earth as disturbed by the action of the sun, and of one planet around the sun as disturbed by the action of another planet.

THREE RIVERS, or TROIS RIVIÈRES, a city and port of entry of Quebec, Canada, and capital of St Maurice county, situated at the confluence of the rivers St Maurice and St Lawrence. The St Maurice flows in from the north, and, being divided at its mouth by two islands, the channels give the town its name. It is on the line of the Canadian Pacific railway, 78 m. S.W. of Quebec and 92 m. N.E. of Montreal. Founded in 1634 by Champlain, Three Rivers is one of the oldest towns in Quebec. It is the centre of a large lumber trade, which is carried on along the St Maurice and its tributaries. Some miles from the city are the St Maurice forges, where iron wares were manufactured as early as the 17th century. Other industries are furniture- and cabinet-making, boot and shoe making, and those carried on in the brass and lead foundries, saw-mills, and carriage factories. The city is the seat of a Roman Catholic bishopric. A large trade is carried on in lumber, grain, cattle, &c., which are shipped to South America, the West Indies, Great Britain and the United States, and a great development has been caused by the utilization of the water-power of the St Maurice at Shawanegan, Grand Meré and other falls, for the manufacture of wood pulp. As a result, the population, long stationary or slightly declining, increased from 8334 (1891) to 9981 (1901), and 12,730 (1906). The city was almost destroyed by fire on the 23rd of June 1908, but it was quickly rebuilt.

THRENODY, a lament written in verse, a dirge, a funeral ode composed in honour of a dead personage. The word is an adaptation of the Greek *θρηνῳδία*, a funeral dirge, from *θρῆνος*, lamentation, wailing, *θρέομαι*, I cry aloud, and *ᾠδή*, a song, ode, *ᾄδειν*, to sing.

THRESHOLD, the door-sill, the piece of stone or wood which is placed at the bottom of a door, gate, or entrance to a house or other building. The word is used in psychology as the equivalent of Ger. *Schwelle* and of Lat. *limen*, *i.e.* the lowest limit of sensation, the point at which the intensity of sensation becomes just noticeable. Etymologically threshold (O. Eng. *þerscold*, M. Eng. þreswold) has usually been divided "thresh," *i.e.* thrash, beat, and *wold*, *wald*, wood; the word meaning the pieces of wood beaten or trampled by the feet. The termination, as is shown by the Old English form, has probably no connexion with *wald*, but is merely a suffix, as in O. H. Ger. *driscūfli*, threshold. The first part is certainly "thrash," beat; some have supposed that in early times the entrance to a house was used as a threshing-floor.

THRIFT, economy in personal or domestic expenditure, the habit and practice of saving, careful or frugal management in money matters. The word, which is borrowed from Scandinavian languages, meant the condition of one who thrives or prospers (M. Eng. *thriven*, Icel. *thrifa*, to clutch, seize, Norw. *triva*, seize). There are several species of plants, such as the sea-pink, *Armeria maritima*, or March rosemary (*Statice*) which from their vigorous growth are often termed "thrift."

THRING, EDWARD (1821–1887), English schoolmaster, was the son of John Gale Dalton Thring, rector of Alford, Somerset, and was born on the 19th of November 1821. His elder brother was Henry, afterwards Lord, Thring (1818–1907) the distinguished Parliamentary counsel (1868–1886), who was made a peer in 1886. Edward was educated first at Ilminster grammar school and afterwards at Eton, where he became head of the school, and Captain of Montem in 1841, the last occasion on which that ancient festival was celebrated. He then entered King's College, Cambridge, won the Porson Prize for Greek Verse, and was elected fellow. At that time King's College scholars retained the privilege of proceeding to a degree without examination, but Thring thought the maintenance of this usage inexpedient in the interests of learning and wholly indefensible in principle, and his vigorous protests against it aroused lively academic controversy, and became effective in 1851, when it was abolished. On leaving the university in 1846 he was ordained, and served for a short time as curate in Gloucester. Here he took remarkable interest in the elementary school of the parish, and ever afterwards attributed much of his professional success and his insight into educational principles and methods to the experience he had acquired in imparting the humble rudiments of learning to the children of the poor. After an interval of two or three years, spent partly in private tuition and partly as curate at Cookham Dean, he married in 1853 a daughter of Carl Koch, commissioner of customs at Bonn, and was elected to the mastership of Uppingham School, a post which he retained until his death in 1887. That school had been founded in 1584, was slenderly endowed, poorly housed, and little known. Thring found only twenty-five boys in it, but he succeeded in raising it, both in numbers and repute, to a position in the first rank among English public schools. He had a strong conviction that there should be a limit to the number of pupils entrusted to the care of one head master, and he fixed that limit at 300, although, owing to the increasing popularity of the school, he was under strong temptation to exceed it. Little by little he surrounded himself with a loyal staff of masters, raised money for the building and equipment of a noble schoolroom and chapel, besides class-rooms and eleven boarding-houses. Among the distinctive features of his plans and achievements were: (1) his strong sense of the need for a closer study of the characteristics of individual boys than is generally found possible in large public schools; (2) his resolute adherence to the discipline of the ancient languages, in connexion with English, as the staple of a liberal education; (3) his careful provision of a great variety of additional employments and interests, in studies and in games, to suit the aptitudes of different pupils; (4) the value he attached to the aesthetic side of school training, as evinced in the encouragement he gave to music and to drawing and to the artistic decoration of the schoolrooms; and above all (5) his rebellion against mere routine, and his constant insistence on the moral purpose of a school as a training-ground for character, rather than as a place solely concerning itself with the acquisition of knowledge. The vigour and intrepidity of his character were conspicuously shown in 1875, when an outbreak of fever made Uppingham for a time untenable, and when, at a few days' notice, he took a disused hotel and some boarding-houses at Borth, on the Cardiganshire coast, and transported the whole 300 boys, with 30 masters and their households, to it as to a city of refuge. Here the school was carried on with undiminished and even fresh zest and efficiency for fourteen months, during which needful sanitary measures were taken in the town.

Unlike Arnold, with whose moral earnestness and lofty educational aims he was in strong sympathy, he took little or no part in outside controversies, political or ecclesiastical. All the activity of his life centred round the school. His was the first public school to establish a gymnasium, and the first to found a town mission in a district of South London, with a view to interest the boys in an effort to improve the social condition of the poor. He took the first step in 1869 in the formation of the Head Masters' Conference, an institution which has ever since done much to suggest improvements in method and to cultivate a sense of corporate life and mutual helpfulness among the teachers in the great schools. And in 1887 he took the bold and unprecedented step of inviting the Association of Head Mistresses to Uppingham, and giving to them a sympathetic address. He also formed an association in Uppingham, with lectures, cookery classes, concerts, and other aids to the intellectual and social improvement of the residents of the little town. He gave valuable evidence before the Schools Inquiry Commission of Lord Taunton in 1866, but it was very characteristic of him that he dreaded the intrusion of public authority, whether that of royal commissioners or of the legislature, into the domain of the school, wherein he thought it indispensable that the liberty and personal inventiveness and enthusiasm of teachers should have full scope and be hindered by no official regulations.

His contributions to literature were not numerous, but were all closely connected with his work as a schoolmaster. They were: *Thoughts on Life Science* (1869), written under the assumed name of Benjamin Place; *Education and School* (1864); *The Theory and Practice of Teaching* (1883); *Uppingham School Sermons* (1858); *The Child's Grammar* (1852); *The Principles of Grammar* (1868); *Exercises in Grammatical Analysis* (1868); *School Songs* (1858); *Borth Lyrics*, poems and translations (1887); and a volume of *Miscellaneous Addresses*, published after his death in 1887.

The fullest account of his life is that written by G. R. Parkin (1898), containing copious extracts from his diary and letters, *A Memory of Edward Thring*; and *Uppingham by the Sea*, written by J. H. Skrine, the warden of Glenalmond, who was first a pupil and afterwards an assistant master at the school, presents a vivid and attractive picture of Thring's active life, and an affectionate and yet discriminating estimate of his character. Other particulars may be found in the chapter devoted to his biography in Sir Joshua Fitch's *Educational Aims and Methods*, and in *Edward Thring, Teacher and Poet*, by Canon H. D. Rawnsley. (J. G. F.)

THROAT (O. Eng. *þrotu*, *þrote* or *þrota*, possibly from *þreōtan*, to press, whence threat, or, with loss of initial *s*, connected with strut, to swell), the term applied to the front external part of the neck from below the chin to the collar-bone in human and animal anatomy, and to the internal parts, which include the gullet, viz. the fauces, pharynx and oesophagus, and the windpipe, viz. the larynx and trachea (see PHARYNX, ALIMENTARY CANAL, and RESPIRATORY SYSTEM: *Anatomy*; and for diseases see PHARYNGITIS, LARYNGITIS, DIPHTHERIA, TONSILITIS and OESOPHAGUS).

THROCKMORTON (or THROGMORTON), **FRANCIS** (1554–1584), English conspirator, was the son of Sir John Throckmorton of Feckenham in Warwickshire, and his wife Margery Puttenham. Sir John had been concerned in Wyat's rebellion against Queen Mary Tudor, but was afterwards known as a sympathizer with the Roman Catholic party in the reign of Queen Elizabeth, and in 1580 was removed from his office of chief justice of Chester for irregularities in his office, but probably because he was suspected of disloyalty by the government. Francis was educated at Hart Hall, Oxford, which he entered in 1572. In 1576 he was enrolled in the Inner Temple. At Oxford he had come under the influence of the Roman Catholics, whose power was still great in the university, and must have heard of Edmund Campian (*q.v.*) who had left shortly before he himself entered the university. When Campian and Parsons came to England in 1580 to conduct the Jesuit propaganda against Queen Elizabeth, Francis Throckmorton was one of a society of members of the Inner Temple who united to hide and help them. In that year he went abroad, first to join his brother Thomas, who was engaged with the exiled Roman Catholics in Paris, and then to travel in Italy and Spain. While abroad he consorted with exiled papists, and was undoubtedly engaged in treasonable intrigues. In 1583 he returned to act as the confidential agent of an elaborate conspiracy which had for its object the invasion of England by a French force under command of the duke of Guise, or by Spaniards and Italians sent by Philip II. for the purpose of releasing the imprisoned Mary Queen of Scots and restoring the authority of the pope. Throckmorton possessed, or occupied, a house on Paul's wharf, London, which served as a meeting-place for the conspirators. Many plots were being carried on alongside of the chief one, and the suspicions of the government were aroused. Throckmorton's constant visits to the Spanish ambassador, Bernardino de Mendoza, attracted attention, and he was arrested in October 1583. He was ciphering a letter to Queen Mary when the constables came upon him suddenly, but he found time to send a casket of compromising papers by a trustworthy maidservant to Mendoza, and a card in cipher in which he promised to reveal nothing. As he refused to confess when brought before the council, he was put on the rack in the Tower. He resisted a first application of the torture, but his strength and courage failed when he was threatened with a second, and he made a full confession. At a later period he retracted and asserted that his avowals were false and had been extorted from him by pain, or had been put in his mouth by the examiners. His confession agreed, however, fully with what is known from other sources of the plot, and there can be no doubt that when his house was searched the constables found lists of his confederates, plans of harbours meant for use by foreign invaders, treatises in defence of the title of the Queen of Scots to the throne of England, and "infamous libels on Queen Elizabeth printed beyond seas." His trial, which in the circumstances was a mere formality, took place on the 21st of May 1584, and he was executed at Tyburn on the 10th of July. The arrest and confession of Throckmorton were events of great importance. They terrified the conspirators, who fled abroad in large numbers, and led to the expulsion of the Spanish ambassador and so to war with Spain.

THROCKMORTON (or THROGMORTON), **SIR NICHOLAS** (1515–1571), English diplomatist and politician, was the fourth of eight sons of Sir George Throckmorton of Congleton in Warwickshire, and uncle of the conspirator Francis Throckmorton (see above). He was brought up in the household of Catherine Parr, the last wife of Henry VIII. In his youth he was favourable to the reformers in religion. He sat in parliament from 1545 to 1567. During the reign of Edward VI. he was in high favour with the regents. In 1547 he was present at the battle of Pinkie during the invasion of Scotland. When on the death of Edward VI. an attempt was made to place Lady Jane Grey on the throne, he contrived to appear as the friend of both parties, and secured the favour of Queen Mary Tudor. He was, however, suspected of complicity in Wyat's rebellion in 1554, and was brought to trial at the Guildhall on the 17th of April of that year. By eloquence, readiness of wit, and adroit flattery of the jury he contrived to secure his acquittal in the face of the open hostility of the judge—a unique achievement at a time when the condemnation of prisoners whom the authorities wished to convict was a mere matter of course. The jurymen were fined and sent to prison, and Throckmorton was detained in the Tower till the following year. There was some talk of bringing him to trial again, but he made his peace, and was employed by Queen Mary. After the accession of Elizabeth he rose rapidly into favour. He became chamberlain of the exchequer, and from May 1559 to April 1564 he was ambassador in France. During the latter part of this period he was associated with Sir Thomas Smith, whose function was at least partly to watch and check his fellow-ambassador. It was in these years that Throckmorton became acquainted with Mary Queen of Scots. He had to conduct the delicate negotiations which accompanied her return to Scotland, and though he was a supporter of the reformers on political grounds, he became her personal friend and was always willing to do her service. As ambassador in France he exerted himself to induce Elizabeth to aid the Huguenots, and took a part in the war of religion. He was taken prisoner by the Catholic leader, the duke of Guise. After his return to England he was sent as ambassador to Scotland in May 1565. The mission entrusted to him was to prevent Queen Mary's marriage with Darnley, which however he was unable to do. After the murder of Darnley he was again sent to Scotland in June 1567 on a still more hopeless mission than the first. He was instructed to persuade the Scottish barons who had just imprisoned the queen to restore her to her authority. His known friendship for Queen Mary and his constant support of her claim to be recognized as Elizabeth's successor, made him a very unwelcome representative of England in that crisis. Moreover, the queen of England increased his difficulties by making him the bearer of offensive messages to the barons, and by contradictory instructions. He cannot have undertaken his task with much zeal, for his own opinion was that Elizabeth would consult her interests best by supporting the barons. In Edinburgh Throckmorton could effect little, but he exerted himself to secure the personal safety of the queen. He offended his mistress by showing his instructions to the Scottish barons, and was recalled in August. In 1569 he fell under suspicion during the duke of Norfolk's conspiracy in favour of Mary, and was imprisoned for a time at Windsor, but was not further proceeded against. He died on the 12th of February 1571. Sir Nicholas married Anne Carew, and his daughter Elizabeth became the wife of Sir Walter Raleigh.

THRONE, a royal, viceregal, or episcopal chair of state standing upon a dais or platform. Formerly the platform, with the steps leading up to it, was comprised in the significance of the word—hence the familiar expression to "mount the throne." The ceremonial induction of a sovereign into his throne is one of the usual solemnities of a coronation, while enthronization of the bishop in his cathedral is the final observance in the making of a diocesan. The throne, which is of immemorial antiquity, is the universal ancestor of all chairs, which were for long symbols of authority and rule. In early days and in Oriental countries thrones were of barbaric magnificence. Solomon's was of ivory "overlaid with the best gold." There were two figures of lions at the sides, with two other lions on each of the six steps. The remains of a throne in rock-crystal were found in the ruins of Sennacherib's palace. The Persian throne made for Abbas the Great was of white marble. This monarch appears to have had a nice taste in thrones, for in 1605 he presented one to the Russian tsar Boris which is covered with sheets of gold and decorated with precious stones and pearls. Tsar Michael Feodorovitch, grandfather of Peter the Great, outdid even this magnificence, for his "golden throne" is set with eight thousand turquoises, fifteen hundred rubies, four great amethysts and two large topazes. One of the glories of Delhi, until it was sacked by Nadir Shah, was the "peacock throne," the value of which was estimated, perhaps with some Eastern exuberance, at twelve millions sterling. It was ascended by silver steps and stood on golden feet set with jewels. It obtained its name from the two open peacocks' tails composed of magnificent diamonds, rubies, and other stones which formed part of its appurtenances. Apparently it was made for Shah Jahan by the French designer of the Taj Mahal. According to that veracious chronicler, Sir John Mandeville, the seven steps of the throne of Prester John were respectively of onyx, crystal, green jasper, amethyst, sardonyx, cornelian and chrysolite. They were bordered with gold and set with pearls. The throne itself was of gold enriched with jewels. Ranjit Singh's golden throne—it is of wood covered with plates of gold—is in the possession of the British Crown. European thrones were usually more modest in conception and less barbaric in execution than those, real or legendary, of the East. The medieval emperors of Byzantium had, however, imbibed a good deal of the Orient, and their famous throne, which is supposed to have been imitated from, as well as named after, that of Solomon, was guarded by golden lions, which rose to their feet and roared when some artful mechanism was set in motion. An exceedingly ancient chair of state is the so-called throne of Dagobert (see CHAIR). The most recent writers on this remarkable relic suggest that it is a bronze copy of Dagobert's golden throne. However that may be, there can be no doubt that it possesses at least one illustrious modern association, for Napoleon sat in it when he distributed the first decorations of the Legion of Honour in his camp at Boulogne in 1804. The throne which Napoleon had made for himself was a heavy gilded chair with an abundance of Egyptian ornament, lions' heads and imperial eagles. One of the many curiosities of a conclave for the electing of a Pope is that every cardinal present occupies a throne, since, during the vacancy of the Holy See, each member of the Sacred College is a potential sovereign. When the election has taken place the canopy of every throne is lowered, with the exception of that occupied by the new pontiff. The palaces of the great Roman nobles contained—and still in some cases contain—a throne for use in the event of a visit from the pope. The papal throne itself is an antique bronze chair which stands in St Peter's. Embassies frequently contain a throne for the use of the sovereign in whose territory the building technically stands. No ancient throne-chair pertains to the British monarchy; the coronation chair is not, properly speaking, a throne, since it is used only during a portion of the coronation ceremonies. The actual throne of Great Britain is the oaken Gothic chair in the House of Lords occupied by the sovereign at the opening and prorogation of parliament.

THRUM-EYED, a botanical term for flowers which occur in two forms, one of which shows the stamens in the mouth of the corolla, as in the primrose, contrasted with pin-eyed (*q.v.*).

THRUSH (A. S. *Þrysce*, Icel. *Þröstr*, Norw. *Trast*, O. H. Ger. *Drosce*, whence the mod. Ger. *Drossel*, to be compared with the analogous English form Throstle,[1] now almost obsolete, both being apparently diminutives), the name that in England seems to have been common to two species of birds, the first now generally distinguished as the song-thrush, but known in many districts as the mavis,[2] the second called the mistletoe-thrush, but having many other local designations, of which more presently.

The former of these is one of the finest songsters in Europe, but it is almost everywhere so common that its merits in this respect are often disregarded, and not unfrequently its melody, when noticed, is ascribed to the prince of feathered vocalists, the nightingale (*q.v.*). In the spring and summer there is hardly a field, a copse or a garden that is not the resort of a pair or more of song-thrushes; and the brown-backed bird with its spotted breast, hopping over the grass for a few yards, then pausing to detect the movement of a worm, and vigorously seizing the same a moment after, is one of the most familiar sights. Hardly less well-known is the singular nest built by this bird—a deep cup, lined with a thin but stiff coating of fragments of rotten wood, ingeniously spread, and plastered so as to present a smooth interior—in which its sea-green eggs spotted with black are laid. An early breeder, it builds nest after nest during the season, and there can be few birds more prolific. Its ravages on ripening fruits, especially strawberries and gooseberries, excite the enmity of the imprudent gardener who leaves his crops unprotected by nets, but he would do well to stay the hand of revenge, for no bird can or does destroy so many snails, as is testified to the curious observer on inspection of the stones that it selects against which to dash its captures—stones that are besmeared with the slime of the victims and bestrewn with the fragments of their shattered shells. Nearly all the young thrushes reared in the British Islands—and this expression includes the storm-swept isles of the Outer Hebrides, though not those of Shetland—seem to emigrate as soon as they are fit to journey, and at a later period they are followed by most of their parents, so that many parts of the kingdom are absolutely bereft of this species from October to the end of January. On the continent of Europe the autumnal influx of the birds bred in the North is regarded with much interest, for they are easily ensnared and justly esteemed for the table, while their numbers make their appearance in certain districts a matter of great importance.

The second species to which the name applies is distinguished as the mistletoe-thrush, or, by corrupt abbreviation, the missel-thrush.[3] It is known also in many districts as the "storm-cock," from its habit of singing in squally weather that silences almost all other birds, and "holm-(*i.e.* holly-) thrush"; while the harsh cries it utters when angry or alarmed have given it other local names, as "screech," "shrite" and "skrike," all traceable to the Anglo-Saxon *Scric*.[4] This is a larger species than the last, of paler tints, and conspicuous in flight by the white patches on its outer tail-feathers. Of bold disposition, and fearless of the sleety storms of spring, as of predatory birds, the cock will take his stand on a tall tree, "like an enchanter calling up the gale" (as Knapp happily wrote), and thence with loud voice proclaim in wild and discontinuous notes the fervour of his love for his mate; nor does that love cease when the breeding-season is past, since this species is one of those that appear to pair for life, and even when, later in the year, it gathers in small flocks, husband and wife may be seen in close company. In defence of nest and offspring, too, few birds are more resolute, and the daw, pie or jay that approaches with an ill intent speedily receives treatment that causes a rapid retreat, while even the marauding cat finds the precincts of the "master of the coppice," (*Pen y llwyn*), as the Welsh name this thrush, unsuitable for its stealthy operations. The connexion of this bird with the mistletoe, which is as old as the days of Aristotle, is no figment, as some have tried to maintain. Not only is it exceedingly fond of the luscious viscid berries, but it seems to be almost the only bird that will touch them.

The thrushes form a distinct family, Turdidae, of the Oscines division of perching birds, and are now divided into five subfamilies: (1) Turdinae, or true thrushes and their immediate allies, the ousel (*q.v.*), the fieldfare (*q.v.*), the redwing (*q.v.*), the rock-thrushes (*Monticola*), the wheatears, stonechats, whinchats (see WHEATEAR), the redstarts (*q.v.*), robins (see REDBREAST), and

[1] For many interesting facts connected with the words "thrush" and "throstle" which cannot be entered upon here, the reader should consult Professor Skeat's *Etymological Dictionary*.

[2] Cognate with the French *mauvis*, though that is nowadays almost restricted to the redwing. Its diminutive is *mauviette*, the modern table-name of the skylark, and perhaps *mavis* was in English originally the table-name of the thrush.

[3] There is no doubt of the bird taking its name from the plant mistletoe (*Viscum album*), about the spelling of which there can be no uncertainty—A. S. *Misteltan*, the final syllable originally signifying "twig," and surviving in the modern "tine," as of a fork or of a deer's antler.

[4] It seems quite possible that the word shrike, though now commonly accepted as the equivalent, in an ornithological sense, of *Lanius*, may have been originally applied to the mistletoe-thrush. In several of the Anglo-Saxon *Vocabularies* dating from the 8th to the 11th century, as printed by Thomas Wright, the word *Scric*, which can be hardly anything else than the early form of "shrike," is glossed *Turdus*.

hedge-sparrows (see SPARROW). In these, as opposed to the warblers, the young are spotted. (2) Myiodectinae, a small group, chiefly South American, with strong bristles round the gape. (3) Sylviinae (see WARBLERS). (4) Polioptilinae or gnat-catchers of North and South America. (5) Miminae or mocking-birds (*q.v.*). The so-called "babbling-thrushes" which occur throughout the Old World are usually referred to a distinct family, the Timeliidae, characterized by strong bills and feet, and short, rounded and incurved wings. The "ant thrushes" belong to a different family (see PITTA). (A. N.)

THUCYDIDES (Θουκυδίδης), Athenian historian. Materials for his biography are scanty, and the facts are of interest chiefly as aids to the appreciation of his life's labour, the *History of the Peloponnesian War*. The older view that he was probably born in or about 471 B.C., is based on a passage of Aulus Gellius, who says that in 431 Hellanicus "seems to have been" sixty-five years of age, Herodotus fifty-three and Thucydides forty (*Noct. att.* xv. 23). The authority for this statement was Pamphila, a woman of Greek extraction, who compiled biographical and historical notices in the reign of Nero. The value of her testimony is, however, negligible, and modern criticism inclines to a later date, about 460[1] (see Busolt, *Gr. Gesch.* iii., pt. 2, p. 621). Thucydides' father Olorus, a citizen of Athens, belonged to a family which derived wealth and influence from the possession of gold-mines at Scaptē Hylē, on the Thracian coast opposite Thasos, and was a relative of his elder namesake, the Thracian prince, whose daughter Hegesipyle married the great Miltiades, so that Cimon, son of Miltiades, was possibly a connexion of Thucydides (see Busolt, ibid., p. 618). It was in the vault of the Cimonian family at Athens, and near the remains of Cimon's sister Elpinice, that Plutarch saw the grave of Thucydides. Thus the fortune of birth secured three signal advantages to the future historian: he was rich; he had two homes—one at Athens, the other in Thrace—no small aid to a comprehensive study of the conditions under which the Peloponnesian War was waged; and his family connexions were likely to bring him from his early years into personal intercourse with the men who were shaping the history of his time.

The development of Athens during the middle of the 5th century was, in itself, the best education which such a mind as that of Thucydides could have received. The expansion and consolidation of Athenian power was completed, and the inner resources of the city were being applied to the embellishment and ennoblement of Athenian life (see CIMON; PERICLES). Yet the *History* tells us nothing of the literature, the art or the social life under whose influences its author had grown up. The "Funeral Oration" contains, indeed, his general testimony to the value and the charm of those influences. But he leaves us to supply all examples and details for ourselves. Beyond a passing reference to public "festivals," and to "beautiful surroundings in private life," he makes no attempt to define those "recreations for the spirit" which the Athenian genius had provided in such abundance. He alludes to the newly-built Parthenon only as containing the treasury; to the statue of Athena Parthenos which it enshrined, only on account of the gold which, at extreme need, could be detached from the image; to the Propylaea and other buildings with which Athens had been adorned under Pericles, only as works which had reduced the surplus of funds available for the war. He makes no reference to Aeschylus, Sophocles, Euripides, Aristophanes; the architect Ictinus; the sculptor Pheidias; the physician Hippocrates; the philosophers Anaxagoras and Socrates. Herodotus, if he had dealt with this period, would have found countless occasions for invaluable digressions on men and manners, on letters and art; and we might almost be tempted to ask whether his more genial, if laxer, method does not indeed correspond better with a liberal conception of the historian's office. No one can do full justice to Thucydides, or appreciate the true completeness of his work, who has not faced this question, and found the answer to it.

It would be a hasty judgment which inferred from the omissions of the *History* that its author's interests were exclusively political. Thucydides was not writing the history of a period. His subject was an event—the Peloponnesian War—a war, as he believed, of unequalled importance, alike in its direct results and in its political significance for all time. To his task, thus defined, he brought an intense concentration of all his faculties. He worked with a constant desire to make each successive incident of the war as clear as possible. To take only two instances: there is nothing in literature more graphic than his description of the plague at Athens, or than the whole narrative of the Sicilian expedition. But the same temper made him resolute in excluding irrelevant topics. The social life of the time, the literature and the art did not belong to his subject.

The biography which bears the name of Marcellinus states that Thucydides was the disciple of Anaxagoras in philosophy and of Antiphon in rhetoric. There is no evidence to confirm this tradition. But Thucydides and Antiphon at least belong to the same rhetorical school and represent the same early stage of Attic prose. Both writers used words of an antique or decidedly poetical cast; both point verbal contrasts by insisting on the precise difference between terms of similar import; and both use metaphors somewhat bolder than were congenial to Greek prose in its riper age. The differences, on the other hand, between the style of Thucydides and that of Antiphon arise chiefly from two general causes. First, Antiphon wrote for hearers, Thucydides for readers; the latter, consequently, can use a degree of condensation and a freedom in the arrangement of words which would have been hardly possible for the former. Again, the thought of Thucydides is often more complex than any which Antiphon undertook to interpret; and the greater intricacy of the historian's style exhibits the endeavour to express each thought.[2] Few things in the history of literary prose are more interesting than to watch that vigorous mind in its struggle to mould a language of magnificent but immature capabilities. The obscurity with which Thucydides has sometimes been reproached often arises from the very clearness with which a complex idea is present to his mind, and his strenuous effort to present it in its entirety. He never sacrifices thought to language, but he will sometimes sacrifice language to thought. A student may always be consoled by the reflection that he is not engaged in unravelling a mere rhetorical tangle. Every light on the sense will be a light on the words; and when, as is not seldom the case, Thucydides comes victoriously out of this struggle of thought and language, having achieved perfect expression of his meaning in a sufficiently lucid form, then his style rises into an intellectual brilliancy—thoroughly manly, and also penetrated with intense feeling—which nothing in Greek prose literature surpasses.

The uncertainty as to the date of Thucydides' birth renders futile any discussion of the fact that before 431 he took no prominent part in Athenian politics. If he was born in 455, the fact needs no explanation; if in 471, it is possible that his opportunities were modified by the necessity of frequent visits to Thrace, where the management of such an important property as the gold-mines must have claimed his presence. The manner in which he refers to his personal influence in that region is such as to suggest that he had sometimes resided there (iv. 105, 1). He was at Athens in the spring of 430, when the plague broke out. If his account of the symptoms has not enabled physicians to agree on a diagnosis of the malady, it is at least singularly full and vivid. He had himself been attacked by the plague; and, as he briefly adds, "he had seen others suffer." The tenor of his narrative would warrant the inference that he had been one of a few who were active in ministering to the sufferers.

The turning-point in the life of Thucydides came in the winter of 424. He was then forty seven (or, according to Busolt, about thirty-six), and for the first time he is found holding an official position. He was one of two generals entrusted with the command of the regions towards Thrace (τὰ ἐπὶ Θρᾴκης), a phrase which denotes the whole Thracian seaboard from Macedonia

[1] Christ (*Gesch. der griech. Litt.*) gives the date of birth as "about 455."

[2] See Jebb's *Attic Orators*, i. 35.

eastward to the vicinity of the Thracian Chersonese, though often used with more special reference to the Chalcidic peninsula. His colleague in the command was Eucles. About the end of November 424 Eucles was in Amphipolis, the stronghold of Athenian power in the north-west. To guard it with all possible vigilance was a matter of peculiar urgency at that moment. The ablest of Spartan leaders, Brasidas (*q.v.*), was in the Chalcidic peninsula, where he had already gained rapid success; and part of the population between that peninsula and Amphipolis was known to be disaffected to Athens. Under such circumstances we might have expected that Thucydides, who had seven ships of war with him, would have been ready to co-operate with Eucles. It appears, however, that, with his ships, he was at the island of Thasos when Brasidas suddenly appeared before Amphipolis. Eucles sent in all haste for Thucydides, who arrived with his ships from Thasos just in time to beat off the enemy from Eion at the mouth of the Strymon, but not in time to save Amphipolis. The profound vexation and dismay felt at Athens found expression in the punishment of Thucydides, who was exiled. Cleon is said to have been the prime mover in his condemnation; and this is likely enough.

From 423 to 404 Thucydides lived on his property in Thrace, but much of his time appears to have been spent in travel. He visited the countries of the Peloponnesian allies—recommended to them by his quality as an exile from Athens; and he thus enjoyed the rare advantage of contemplating the war from various points of view. He speaks of the increased leisure which his banishment secured to his study of events. He refers partly, doubtless, to detachment from Athenian politics, partly also, we may suppose, to the opportunity of visiting places signalized by recent events and of examining their topography. The local knowledge which is often apparent in his Sicilian books may have been acquired at this period. The mind of Thucydides was naturally judicial, and his impartiality—which seems almost superhuman by contrast with Xenophon's *Hellenica*—was in some degree a result of temperament. But it cannot be doubted that the evenness with which he holds the scales was greatly assisted by his experience during these years of exile.

His own words make it clear that he returned to Athens, at least for a time, in 404, though the precise date is uncertain. The older view (cf. Classen) was that he returned some six months after Athens surrendered to Lysander. More probably he was recalled by the special resolution carried by Oenobius prior to the acceptance of Lysander's terms (Busolt, ibid., p. 628). He remained at Athens only a short time, and retired to his property in Thrace, where he lived till his death, working at his *History*. The preponderance of testimony certainly goes to show that he died in Thrace, and by violence. It would seem that, when he wrote chapter 116 of his third book, he was ignorant of an eruption of Etna which took place in 396. There is, indeed, strong reason for thinking that he did not live later than 399. His remains were brought to Athens and laid in the vault of Cimon's family, where Plutarch (*Cimon*, 4) saw their resting-place. The abruptness with which the *History* breaks off agrees with the story of a sudden death. The historian's daughter is said to have saved the unfinished work and to have placed it in the hands of an editor. This editor, according to one account, was Xenophon, to whom Diogenes Laërtius (ii. 6, 13) assigns the credit of having "brought the work into reputation, when he might have suppressed it." The tradition is, however, very doubtful; it may have been suggested by a feeling that no one then living could more appropriately have discharged the office of literary executor than the writer who, in his *Hellenica*, continued the narrative.

The History.—At the outset of the *History* Thucydides indicates his general conception of his work, and states the principles which governed its composition. His purpose had been formed at the very beginning of the war, in the conviction that it would prove more important than any event of which Greeks had record. The leading belligerents, Athens and Sparta, were both in the highest condition of effective equipment. The whole Hellenic world—including Greek settlements outside of Greece proper—was divided into two parties, either actively helping one of the two combatants or meditating such action. Nor was the movement confined within even the widest limits of Hellas; the "barbarian" world also was affected by it—the non-Hellenic populations of Thrace, Macedonia, Epirus, Sicily and, finally, the Persian kingdom itself. The aim of Thucydides was to preserve an accurate record of this war, not only in view of the intrinsic interest and importance of the facts, but also in order that these facts might be permanent sources of political teaching to posterity. His hope was, as he says, that his *History* would be found profitable by "those who desire an exact knowledge of the past as a key to the future, which in all probability will repeat or resemble the past. The work is meant to be a possession for ever, not the rhetorical triumph of an hour." As this context shows, the oft-quoted phrase, "a possession for ever," had, in its author's meaning, a more definite import than any mere anticipation of abiding fame for his *History*. It referred to the permanent value of the lessons which his *History* contained.

Thucydides stands alone among the men of his own days, and has no superior of any age, in the width of mental grasp which could seize the general significance of particular events. The political education of mankind began in Greece, and in the time of Thucydides their political life was still young. Thucydides knew only the small city-commonwealth on the one hand, and on the other the vast barbaric kingdom; and yet, as has been well said of him, "there is hardly a problem in the science of government which the statesman will not find, if not solved, at any rate handled, in the pages of this universal master."[1]

Such being the spirit in which he approached his task, it is interesting to inquire what were the points which he himself considered to be distinctive in his method of executing it.

His Predecessors.

His Greek predecessors in the recording of events had been, he conceived, of two classes. First, there were the epic poets, with Homer at their head, whose characteristic tendency, in the eyes of Thucydides, is to exaggerate the greatness or splendour of things past. Secondly, there were the Ionian prose writers whom he calls "chroniclers" (see LOGOGRAPHI), whose general object was to diffuse a knowledge of legends preserved by oral tradition and of written documents—usually lists of officials or genealogies—preserved in public archives; and they published their materials as they found them, without criticism. Thucydides describes their work by the word ξυντιθέναι, but his own by ξυγγράφειν—the difference between the terms answering to that between compilation of a somewhat mechanical kind and historical composition in a higher sense. The vice of the "chroniclers," in his view, is that they cared only for popularity, and took no pains to make their narratives trustworthy. Herodotus was presumably regarded by him as in the same general category.

Distinctive Aim of Thucydides.

In contrast with these predecessors Thucydides has subjected his materials to the most searching scrutiny. The ruling principle of his work has been strict adherence to carefully verified facts. "As to the deeds done in the war, I have not thought myself at liberty to record them on hearsay from the first informant or on arbitrary conjecture. My account rests either on personal knowledge or on the closest possible scrutiny of each statement made by others. The process of research was laborious, because conflicting accounts were given by those who had witnessed the several events, as partiality swayed or memory served them."

The Speeches.

It might be supposed that the speeches which Thucydides has introduced into his *History* conflict with this standard of scientific accuracy; it is, therefore, well to consider their nature and purpose rather closely. The speeches constitute between a fourth and a fifth part of the *History*. If they were eliminated, an admirable narrative would indeed remain, with a few comments, usually brief, on the more striking characters and events. But we should lose all the most vivid light on the inner workings of the Greek political mind, on the motives of the actors and the arguments which they used—in a word, on the whole play of contemporary feeling and opinion. To the speeches is due in no small measure the imperishable intellectual interest of the *History*, since it is chiefly by the speeches that the facts of the Peloponnesian War are so lit up with keen thought as to become illustrations of general laws, and to acquire a permanent suggestiveness for the student of politics. When Herodotus made his persons hold conversations or deliver speeches, he was following the precedent of epic poetry; his tone is usually colloquial rather than rhetorical; he is merely making thought and motive vivid in the way natural to a simple age. Thucydides is the real founder of the tradition by which historians were so long held to be warranted in introducing set speeches of their own composition. His own account of his practice is given in the following words: "As to the speeches made on the eve of the war, or in its course, I have found it difficult to retain a memory of the precise words which I had heard spoken; and so it was with those who brought me reports

[1] Freeman, *Historical Essays*, 2nd series, vol. iii.; on the general questions of the structure of the work and the view of the war which it represents see PELOPONNESIAN WAR; and GREECE: *Ancient History*, § Authorities.

But I have made the persons say what it seemed to me most opportune for them to say in view of each situation; at the same time I have adhered as closely as possible to the general sense of what was actually said." So far as the language of the speeches is concerned, then, Thucydides plainly avows that it is mainly or wholly his own. As a general rule, there is little attempt to mark different styles. The case of Pericles, whom Thucydides must have repeatedly heard, is probably an exception; the Thucydidean speeches of Pericles offer several examples of that bold imagery which Aristotle and Plutarch agree in ascribing to him, while the "Funeral Oration," especially, has a certain majesty of rhythm, a certain union of impetuous movement with lofty grandeur, which the historian has given to no other speaker. Such strongly marked characteristics as the curt bluntness of the Spartan ephor Sthenelaïdas, or the insolent vehemence of Alcibiades, are also indicated. But the dramatic truth of the speeches generally resides in the matter, not in the form. In regard to those speeches which were delivered at Athens before his banishment in 424—and seven such speeches are contained in the *History*—Thucydides could rely either on his own recollection or on the sources accessible to a resident citizen. In these cases there is good reason to believe that he has reproduced the substance of what was actually said. In other cases he had to trust to more or less imperfect reports of the "general sense"; and in some instances, no doubt, the speech represents simply his own conception of what it would have been "most opportune" to say. The most evident of such instances occur in the addresses of leaders to their troops. The historian's aim in these military harangues—which are usually short—is to bring out the points of a strategical situation; a modern writer would have attained the object by comments prefixed or subjoined to his account of the battle. The comparative indifference of Thucydides to dramatic verisimilitude in these military orations is curiously shown by the fact that the speech of the general on the one side is sometimes as distinctly a reply to the speech of the general on the other as if they had been delivered in debate. We may be sure, however, that, wherever Thucydides had any authentic clue to the actual tenor of a speech, he preferred to follow that clue rather than to draw on his own invention.

The Greek View.

Why, however, did he not content himself with simply stating, in his own person, the arguments and opinions which he conceived to have been prevalent? The question must be viewed from the standpoint of a Greek in the 5th century B.C. Epic poetry had then for many generations exercised a powerful influence over the Greek mind. Homer had accustomed Greeks to look for two elements in any complete expression of human energy—first, an account of a man's deeds, then an image of his mind in the report of his words. The Homeric heroes are exhibited both in action and in speech. Further, the contemporary readers of Thucydides were men habituated to a civic life in which public speech played an all-important part. Every adult citizen of a Greek democracy was a member of the assembly which debated and decided great issues. The law courts, the festivals, the drama, the market-place itself, ministered to the Greek love of animated description. To a Greek of that age a written history of political events would have seemed strangely insipid if speech "in the first person" had been absent from it, especially if it did not offer some mirror of those debates which were inseparably associated with the central interests and the decisive moments of political life. In making historical persons say what they might have said, Thucydides confined that oratorical licence to the purpose which is its best justification: with him it is strictly dramatic, an aid to the complete presentment of action, by the vivid expression of ideas and arguments which were really current at the time. Among later historians who continued the practice, Polybius, Sallust and Tacitus most resemble Thucydides in this particular; while in the Byzantine historians, as in some moderns who followed classical precedent, the speeches were usually mere occasions for rhetorical display. Botta's *History of Italy* from 1780 to 1814 affords one of the latest examples of the practice, which was peculiarly suited to the Italian genius.

The Eight Books.

The present division of the *History* into eight books is one which might well have proceeded from the author himself, as being a natural and convenient disposition of the contents. The first book, after a general introduction, sets forth the causes of the Peloponnesian War. The first nine years of the war are contained in the second, third and fourth books—three years in each. The fifth book contains the tenth year, followed by the interval of the "insecure peace." The Sicilian expedition fills the sixth and seventh books The eighth books opens that last chapter of the struggle which is known as the "Decelean" or "Ionian" War, and breaks off abruptly—in the middle of a sentence, indeed—in the year 411.

Origin of that Division.

The principal reason against believing that the division into eight books was made by Thucydides himself is the fact that a different division, into thirteen books, was also current in antiquity, as appears from Marcellinus (§ 58). It is very improbable—indeed hardly conceivable—that this should have been the case if the eight-book division had come down from the hand of the author. We may infer, then, that the division of the work into eight books was introduced at Alexandria—perhaps in the 3rd or 2nd century B.C. That division was already familiar to the grammarians of the Augustan age. Dionysius of Halicarnassus, who recognizes it, has also another mode of indicating portions of the work, viz. by *stichometria*, or the number of lines which they contained. Thus, in the MS. which he used, the first 87 chapters of book i. contained about 2000 lines (equivalent to about 1700 lines in Bekker's stereotyped 8vo text). (On the order of composition, see PELOPONNESIAN WAR, *ad init.*; and GREECE: *Ancient History*, § Authorities).

Mode of Reckoning Time.

The division of the war by summers and winters (κατὰ θέρος καὶ χειμῶνα)—the end of the winter being considered as the end of the year—is perhaps the only one which Thucydides himself used, for there is no indication that he made any division of the *History* into books. His "summer" includes spring and autumn and extends, generally speaking, from March or the beginning of April to the end of October. His "winter"—November to February inclusive—means practically the period during which military operations, by land and sea, are wholly or partly suspended. When he speaks of "summer" and "winter" as answering respectively to "half" the year (v. 20, 3), the phrase is not to be pressed: it means merely that he divides his year into these two parts. The mode of reckoning is essentially a rough one, and is not to be viewed as if the commencement of summer or of winter could be precisely fixed to constant dates. For chronology, besides the festivals, he uses the Athenian list of archons, the Spartan list of ephors and the Argive list of priestesses of Hera.

There is no reference to the *History* of Thucydides in the extant Greek writers of the 4th century B.C.; but Lucian has preserved a tradition of the enthusiasm with which it was studied by Demosthenes. The great orator is said to have copied it out eight times, or even to have learnt it by heart. The Alexandrian critics acknowledged Thucydides as a great master of Attic. Sallust, Cornelius Nepos, Cicero and Quintilian are among the Roman writers whose admiration for him can be traced in their work, or has been expressly recorded. The most elaborate ancient criticism on the diction and composition of Thucydides is contained in three essays by Dionysius of Halicarnassus.

MSS., &c.

Among the best MSS. of Thucydides, the Codex vaticanus 126 (11th century) represents a recension made in the Alexandrian or Roman age. In the first six books the number of passages in which the Vaticanus alone has preserved a true reading is comparatively small; in book vii. it is somewhat larger; in book viii. it is so large that here the Vaticanus, as compared with the other MSS., acquires the character of a revised text. Other important MSS. are the Palatinus 252 (11th century); the Casselanus (A.D. 1252); the Augustanus monacensis 430 (A.D. 1301). A collation, in books i., ii., of two Cambridge MSS. of the 15th century (NN. 3, 18; KK. 5, 19) has been published by Shilleto. Several Parisian MSS. (H. C. A. F.), and a Venetian MSS. (V.) collated by Arnold, also deserve mention. The Aldine edition was published in 1502. It was formerly supposed that there had been two Juntine editions. Shilleto, in the "Notice" prefixed to book i., first pointed out that the only Juntine edition was that of 1526, and that the belief in an earlier Juntine, of 1506, arose merely from the accidental omission of the word *vicesimo* in the Latin version of the imprint. Some papyrus fragments were published in Grenfell and Hunt's *Oxyrhynchus papyri* (1908), vi., which also contains an anonymous commentary (pub. 1st century) on Thuc. ii.

The most generally useful edition is Classen's, in the Weidmann Series (1862–1878; new ed. by Steup, 1882–1892); each book can be obtained separately. Arnold's edition (1848–1851) contains much that is still valuable. For books i. and ii. Shilleto's edition (1872–1876) furnishes a commentary which, though not full, deals admirably with many difficult points. Among other important complete editions, it is enough to name those of Duker, Bekker, Goeller, Poppo and Krüger. For editions of separate books and selections (up to 1895) see J. B. Mayor's *Guide to the Choice of Classical Books.* Special mention may be made of those by E. C. Marchant. Later editions of the text are by H. Stuart Jones (1900–1901), in the Oxford *Scriptorum classicorum bibliotheca*, and C. Hude ("Teubner Series," 1901; ed. minor, 1903). Bétant's lexicon to Thucydides (1843) is well executed. Jowett's translation (1883) is supplemented by a volume of notes. Dale's version (Bohn) also deserves mention for its fidelity, as Crawley's (1876) for its vigour. *Hellenica* (1880) contains an essay on "The Speeches of Thucydides," which has been translated into German (see Eduard Meyer, *Forschungen zur alten Geschichte*, Bd. ii. pp. 269–436). The best clue to Thucydidean bibliography is in Engelmann's *Scriptores graeci* (1880), supplemented by the articles by G. Meyer, in Bursian's *Jahresbericht*, (1895) lxxix., (1897) lxxxviii. Busolt, *Griechische Geschichte*, iii. 616–693, is invaluable. For the life of Thucydides, U. von Wilamowitz-Moellendorff, "Die Thukydides-Legende," *Hermes*, (1878) xii., is all important. All works on ancient Greek History contain discussions of Thucydides, and an interesting criticism is that of J. B. Bury, *Ancient Greek Historians* (1909). F. M. Cornford, *Thucydides mythistoricus* (1907), sought to prove that the *History* is really only an historical tragedy, *i.e.* a dramatized version of the facts, but this view has not been adopted. (R. C. J.; J. M. M.)

THUGS. That the Sanskrit root *sthag* (Pali, *ṭhak*), to cover, to conceal, was mainly applied to fraudulent concealment, appears from the noun *sthaga*, a cheat, which has retained this signification in the modern vernaculars, in all of which it has assumed the form *ṭhag* (commonly written *thug*), with a specific meaning. The Thugs were a well-organized confederacy of professional assassins, who in gangs of whom 10 to 200 travelled in various guises through India, wormed themselves into the confidence of wayfarers of the wealthier class, and, when a favourable opportunity occurred, strangled them by throwing a handkerchief or noose round their necks, and then plundered and buried them. All this was done according to certain ancient and rigidly prescribed forms and after the performance of special religious rites, in which the consecration of the pickaxe and the sacrifice of sugar formed a prominent part. From their using the noose as an instrument of murder they were also frequently called *Phansigars*, or "noose-operators." Though they themselves trace their origin to seven Mahommedan tribes, Hindus appear to have been associated with them at an early period; at any rate, their religious creed and practices as stanch worshippers of Kali (Devi, Durga), the Hindu goddess of destruction, had certainly no flavour of Islam in them. Assassination for gain was with them a religious duty, and was considered a holy and honourable profession. They had, in fact, no idea of doing wrong, and their moral feelings did not come into play. The will of the goddess by whose command and in whose honour they followed their calling was revealed to them through a very complicated system of omens. In obedience to these they often travelled hundreds of miles in company with, or in the wake of, their intended victims before a safe opportunity presented itself for executing their design; and, when the deed was done, rites were performed in honour of that tutelary deity, and a goodly portion of the spoil was set apart for her. The fraternity possessed also a jargon of their own (*Ramasi*), as well as certain signs by which its members recognized each other in the remotest parts of India. Even those who from age or infirmities could no longer take an active part in the operations continued to aid the cause as watchers, spies, or dressers of food. It was owing to their thorough organization, the secrecy and security with which they went to work, but chiefly to the religious garb in which they shrouded their murders, that they could, unmolested by Hindu or Mahommedan rulers, recognized as a regular profession and paying taxes as such, continue for centuries to practise their craft. Both the fractions into which they were divided by the Nerbudda river laid claim to antiquity: while the northern, however, did not trace their origin further back than the period of the early Mahommedan kings of Delhi, the southern fraction not only claimed an earlier and purer descent, but adhered also with greater strictness to the rules of their profession.

The earliest authenticated mention of the Thugs is found in the following passage of Ziau-d din Barni's *History of Firoz Shah* (written about 1356): "In the reign of that sultan," that is, about 1290, "some Thugs were taken in Delhi, and a man belonging to that fraternity was the means of about a thousand being captured. But not one of these did the sultan have killed. He gave orders for them to be put into boats and to be conveyed into the lower country, to the neighbourhood of Lakhnauti, where they were to be set free. The Thugs would thus have to dwell about Lakhnauti and would not trouble the neighbourhood of Delhi any more" (Sir H. M. Elliot's *History of India*, iii. 141). The first European travellers who speak of them without mentioning their name are Thévenot (1665) and Fryer (1673). Though instances of Thagi (Thuggee) had been known to the English rulers in India for many years, and sporadic efforts had been made by them towards the extinction of the gangs, it was not till Lord W. Bentinck (1828–1835) took vigorous steps in this matter that the system was gradually unmasked, and finally all but stamped out. His chief agent, Captain (afterwards Sir William) Sleeman, with several competent assistants, and the co-operation of a number of native states, succeeded in completely grappling with the evil, so that up to October 1835 no fewer than 1562 Thugs had been committed, of which number 382 were hanged and 986 transported or imprisoned for life. According to the *Thuggee and Dacoity Report for 1879*, the number of registered Punjabi and Hindustani Thugs then still amounted to 344; but all of these had already been registered as such before 1852, and the whole fraternity may now be considered as extinct. The Thuggee and Dacoity department continued to exist until 1904, though its operations had long been confined to the suppression of organized robbery in native states. Its place is now taken by the Central Criminal Intelligence department.

Full particulars concerning the system of Thagi are given by Dr Sherwood, "On the Murderers called Phansigars," and J. Shakespear, "Observations regarding Bradheks and Thegs" (both treatises in vol. xiii. (1820), of the *Asiatic Researches*); W. N. Sleeman, *Ramaseeana, or a Vocabulary of the Language used by the Thugs, with an Introduction and Appendix* (Calcutta, 1836); the *Edinburgh Review* for January 1837; E. Thornton, *Illustrations of the History and Practices of the Thugs* (London, 1837); Meadows Taylor, *Confessions of a Thug* (London, 1839; new ed. 1879); Major Sleeman, *Report on the Depredations committed by the Thug Gangs* (Calcutta, 1840); J. Hutton, *Popular Account of the Thugs and Dacoits* (London, 1857). (R. R.)

THUGUT, JOHANN AMADEUS FRANCIS DE PAULA, BARON (1736–1818), Austrian diplomatist, was born at Linz on the 24th of May 1736. His origin and name have been the subject of legends more or less malicious and probably the inventions of enemies. It has been said that the correct form of his name was Thunichtgut, or Thenitguet (do no good), and was altered to Thugut (do good) by Maria Theresa. Tunicotta has been given as a variation. But Thugut was the name of his great-grandfather, who belonged to Budweiss in southern Bohemia. He was the legitimate son of Johann Thugut, an army paymaster, who married Eva Maria Mösbauer, daughter of a miller near Vienna. The paymaster, who died about 1760, left his widow and children in distress, and Maria Theresa took charge of them. Johann Amadeus was sent to the school of Oriental languages. He entered the Austrian foreign office as an interpreter and was appointed dragoman to the embassy at Constantinople. In 1769 he was appointed chargé d'affaires, and in that capacity secured a grant of money and a promise of the territory of Little Wallachia from the Turks during the negotiations connected with the first partition of Poland (see POLAND: *History*). In 1771 he was appointed internuncio at Constantinople and was actively engaged, under the direction of Prince Kaunitz, in all the diplomacy of Austria in Turkey and Poland until he secured the cession of the Bukovina on the 7th of May 1775. During these years Thugut was engaged in a mean intrigue. His salary as dragoman was small, and his needs great. He therefore agreed to receive a pension of 13,000 livres, a brevet of lieutenant-colonel, and a promise of a safe refuge in case of necessity from the king of France, Louis XV. The condition on which the pension was granted was that he took advantage of his position as an Austrian official to render secret services to France. The only excuses to be made for him are that such hidden arrangements were not uncommon before and in his time, and that as a matter of fact he never did render France any real service, or betray his masters at Vienna. Yet the terror of discovery disturbed him at several periods of his life, and when Louis XV. died in 1774 he showed a strong disposition to take refuge in France, and would have done so if Louis XVI. would have given him a promise of employment. His pension was continued. It seems to be tolerably certain that at a later period he made a clean breast to the emperor Francis II. His services at Constantinople were approved by Prince Kaunitz (*q.v.*), who may possibly have been informed of the arrangement with the French secret diplomatic fund. It is never safe to decide whether these treasons were single or double. When Thugut was appointed internuncio he was also ennobled, being raised to the *Ritterstand*. After 1775 he travelled in France and Italy, partly on diplomatic service. In 1778 he was the agent through whom Maria Theresa entered into direct negotiations with Frederick the Great, in order to stop the Bavarian War. In 1780 he was Austrian envoy in

Warsaw, but in 1783 he applied for leave and satisfied his hankering after France by living for four years in Paris. It was in this time that his savings, made during his years of service at Constantinople, by means which would probably not bear investigation, were invested in France. Thugut became acquainted with many of the leaders in the Revolution. From 1787 to 1789 he was minister at Naples, and showed great tact in managing the queen, Maria Carolina, a daughter of Maria Theresa. In 1790 he was sent by the emperor Joseph II. to Bucharest, nominally as commissioner with the hospodar of Wallachia, but in reality in order that he might open negotiations for peace with the Turks. Until 1792 he was much in France and Belgium, partly as a diplomatic agent, but largely because he was anxious to rescue his investments, which were ultimately lost. His personal grievances may have had some share in creating the hatred of the Revolution and the Jacobins, for which he was afterwards famous. In 1792 he was associated with Mercy Argenteau, formerly Austrian ambassador in France, as diplomatic agent at the headquarters of the allied army. The mismanagement of the invasion of France excited his anger. He came back to Vienna to report the facts to Francis II., to whom he presented a statement on the 27th of December. On the 19th of January 1793 he was appointed *armée-diplomat* at headquarters, largely, it is said, by the intrigues of Philip Cobenzl and Spielmann, who wished to have him out of the way. But he never went, for at this time Russia and Prussia annexed large parts of Poland. Austria, entangled in the war with France, was left empty-handed (see POLAND: *History*). The emperor, dissatisfied with the ministers who had not prevented this misfortune, dismissed them, and after some delay Thugut was named "director of the foreign affairs of Austria" on the 25th of March 1793. When Prince Kaunitz died in the following year Thugut was appointed to "discharge the duties of the office of house, court, and state chancellor." His promotion to the foremost place in the Austrian administration met with much opposition, and is known to have been largely due to the empress Maria Theresa of Naples. The Austrian government was by tradition very aristocratic. The empress Maria Theresa, mother of Francis II., though she valued the services of Thugut, had consented with reluctance to make him commander of the order of St Stephen, and had only yielded to the urgent requests of Kaunitz and of her son Joseph II. She thought the promotion excessive for a man of his plebeian origin. The nobles, who thought that the great offices of state should go to themselves, were of the same opinion. Thugut, who had a large fund of vanity, resented their insolence, and did nothing to disarm their hostility. He was unmarried, and he avoided all society. In the discharge of his duties he took counsel with nobody. All the confidential work of his department was done by himself with the help of two clerks he could trust, and he took all important papers directly to the emperor, keeping no copies in his own office. He had his own experience to teach him how easy it was to bribe the officials of Austria. The nobles, who regarded themselves with good cause as the supporters of the Crown, and who expected to be consulted, resented his indifference and secrecy as the arrogance of an upstart. They were his constant enemies and critics. A few of them who admired his abilities supported him on personal grounds, but with these exceptions Thugut had no friends in Austria. Out of it, he was commonly regarded as the representative of all that was most unscrupulous and self-seeking in the methods of the Austrian government. He had inherited from his master Prince Kaunitz the firm conviction that Prussia was the worst enemy of Austria. From him, too, he had learnt that the first duty of an Austrian minister was to be an increaser of the empire, even at the expense of allies, and that excuses for annexation were to be made when they could not be found. His hatred of France, and of the Revolution, was no doubt sincere. But while prepared to defend Europe from French aggression, it was with the implied intention that Austria should be rewarded for her exertions by increases of territory, and should be made the absolute mistress of Germany. The history of his policy from 1793 to 1800 is the history of Europe. The conflicting objects which he kept before him, resistance to French aggression on the west, and to Russian and Prussian aggressions on the east, and the pursuit of more territory for Austria, compelled him to divide his exertions and his forces. Thus in 1793–94 he recalled troops from the west to participate in a partition of Poland, thereby taking pressure off France, and doing much to smooth the way for her subsequent victories. Some of his actions cannot be described as other than criminal. He was certainly responsible for the murderous attack on the French envoys at Rastadt in April 1799. He may have intended that they should only be robbed, but he must be held responsible for the acts of his agents. So again he has to answer for the perverse policy of Austria in 1799 when Suvarov (*q.v.*) and the Russians were recalled from northern Italy for no visible reason except that Austria should be left in sole possession of the dominions of the king of Sardinia, with a good excuse for keeping them. The correspondence of Joseph de Maistre shows how bitterly the continental allies of Austria resented her selfishness, and how firmly they were persuaded that she was fighting for her own hand. That Thugut believed that he was doing his duty, and that he was carrying on the traditional policy of Austria, may be true. Yet his methods were so extreme, and his attitude so provocative as to justify the judgment passed on him by Kaunitz —namely, that he required the control of a strong hand if good results were to be obtained from his ability. After the defeats of Austria in Italy in 1796–97 and the peace of Campo Formio, it became a fixed object with the French, and with a growing party in Austria who held him responsible for the disasters of the war, to secure the removal of Thugut. He found no support, except from the British government, which considered him as a sure ally and had great influence at Vienna as paymaster of subsidies. The death of the empress Catherine of Russia deprived him of a friend at court. During the campaigns of 1799 and 1800 Thugut was the advocate of war "to the knife." At the end he was kept in office only by the vigorous support of England. The battle of Hohenlinden on the 3rd of December 1800 made his position untenable. He retired from public life, and left Vienna for Pressburg on the 27th of March 1801. At a later period he returned to Vienna and lived quietly on a pension of 7000 florins till his death on the 28th of May 1818. In personal appearance Thugut is described as looking like "a faunish Mephistopheles," a favourite of Louis XI., an Italian tyrant of the worst type, and by the prince de Ligne as what Henry IV. of France would have been if he had been king of the Jews, and if his mouth had worn a constant expression of derision, hate and malignity. The only known portrait of him appears to bear out these unpleasant descriptions.

See A. von Vivenot, *Thugut und sein politisches System*, a strong defence of his policy in 1793–1794 (Vienna, 1870); and *Quellen z. Geschichte d. deutschen Kaiserpolitik Oesterreichs während d. französ. Revolutions-Krieg* (Vienna, 1873–1885).

THUIN, a town of Belgium, in that part of the province of Hainaut called "entre Sambre et Meuse." Pop. (1904), 6198. It is situated on the Sambre about 9 m. S.W. of Charleroi. The old part of the town, which dates back to the 10th century, occupies a narrow promontory between the Sambre and a small stream called the Biesmelle. The ruined tower called after him is all that remains of the fortress constructed by Bishop Notger of Liége. It was successfully defended against the Normans and long afterwards against the French under Marshal de Lorges in 1654. Although the town itself retains something of its medieval appearance it is the centre of a great manufacturing and mining district, the banks of the Sambre being lined with factories and coal-yards.

THULE, the Greek and Roman name for the most northerly known land in the north Atlantic. The first to use the name was the Greek navigator Pytheas (about 300 B.C. probably). He calls it the most northerly of the British Isles and says that he reached it after six days' sail from Britain: it was inhabited, but produced little; corn grew there sparingly and ripened ill; in summer the nights were long and bright. This account of his travels is lost save for fragments, and the few surviving fragments

do not determine where his Thule was, but Müllenhoff is probably right in thinking it was the Shetlands. The Faeroes, Iceland and Norway have also been suggested, but are for various reasons much less likely. After Pytheas, the name is used loosely for the farthest north. Thus Agricola's fleet in A.D. 84 sailing up the east coast of Scotland is said to have espied but not to have reached Thule ("dispecta est Thule") but the phrase is merely literary. The actual point meant may be the Orkneys or the Shetlands, or even some fragment of Scotland seen across the water. In some later writers (Procopius, &c.) Thule seems sometimes used to denote Scandinavia. The phrase "ultima Thule" is commonly used to describe the farthest limit possible.
(F. J. H.)

THÜMMEL, MORITZ AUGUST VON (1738–1817), German humorist and satirical author, was born on the 27th of May 1738 at Schönefeld near Leipzig. Educated at Rossleben and the university of Leipzig, where he studied law, he held from 1761 till 1783 various offices in the ducal court of Saxe-Coburg, where he became privy councillor and minister of state. He retired in 1783 and died at Coburg on the 26th of October 1817. He wrote a comic prose epic, *Wilhelmine, oder der vermählte Pedant* (1764); and *Die Inoculation der Liebe* (1771), a tale in verse. His most famous work is his *Reise in die mittäglichen Provinzen von Frankreich im Jahre 1785–1786* (1791–1805), a "sentimental journey" in ten volumes, in which the influence of Wieland is unmistakable. Schiller, who found this work wanting in aesthetic dignity, yet allowed that the keen knowledge of men and things it displays makes it a valuable contribution to literature. Thümmel's other writings are unimportant.

His collected works were published at Leipzig in six volumes (1812), and again in 1820 (7 vols.), with a biography by J. E. von Gruner. The most recent edition is that of 1855 (8 vols.). See also F. Bobertag, *Erzählende Prosa der klassischen Periode* vol. i. (Kürschner's *Deutsche Nationalliteratur*, vol. cxxxvi., 1886). *Wilhelmine* has also been edited by R. Rosenbaum (1894).

THUN (Fr. *Thoune*), a picturesque little town in the Swiss canton of Bern, built on the banks of the Aar, just as it issues from the Lake of Thun, and by rail 19 m. S.E. of Bern, or 17½ m. N.W. of Interlaken. It is the capital of the Bernese Oberland, the snowy peaks of which are well seen from it. It has 6030 inhabitants, mostly German-speaking and Protestants. The 18th-century parish church and the 15th-century castle rise in a striking fashion above the town, in the chief street of which are arcades (locally called *Lauben*) as in Bern. There is a museum in the tower of the castle, while in and near the town (in the Heimberg valley) are several potteries of local ware. From its local lords it passed by 1127 to the house of Zähringen, and on its extinction (1218) to the counts of Kyburg. The heiress of that family brought Thun (and Burgdorf) in 1273 to the cadet or Laufenburg line of the Habsburg family, her mother having (1264) granted the town a charter of liberties that confirmed an earlier grant of 1256. In 1375 the town was mortgaged to Bern, to which it was sold outright in 1384. From 1798 to 1802 Thun was the capital of the canton Oberland of the Helvetic Republic. (W. A. B. C.)

THUN, LAKE OF, in the Swiss canton of Bern, the second lake (the first being that of Brienz) into which the river Aar (*q.v.*) expands. It lies in a deep hollow between (N.W.) the town of Thun (*q.v.*) and (E.) the plain on which Interlaken (*q.v.*) is built between this lake and that of Brienz. It is 11½ m. in length, 2 m. in width, and its maximum depth is 712 ft., while its area is 18½ sq. m., and its surface is 1837 ft. above sea-level. Most splendid views of the great snowy peaks of the Bernese Oberland range are obtained from the lake, while the beauty of its shores renders it a formidable rival in point of picturesqueness to the Lake of Lucerne. Its chief feeder is the Kander (swollen shortly before by the Simme), which in 1714 was diverted by a canal into the lake (south-western end). On or above the south-western shore (along which runs the railway from Thun to Interlaken, 17½ m.) are Spiez (a picturesque village with an ancient castle, and the starting-point of railways towards the Gemmi and Montreux) and Aeschi (admirably situated on a high ridge). On the other shore of the lake are Oberhofen and Gunten (above which is Sigriswil), and Merligen, while above the lake, near its east end, are the wooded heights of St Beatenberg, well known to summer visitors. The first steamer was placed on the lake in 1835. (W. A. B. C.)

THUNBERG, KARL PETER (1743–1828), Swedish naturalist, was born at Jönköping on the 11th of November 1743, and became a pupil of Linnaeus at the university of Upsala. After graduating in medicine there in 1770 he obtained an appointment as surgeon in the Dutch East India Company, and sailed to the Cape of Good Hope in 1772. He spent three years there, and then went to Japan, where he remained till 1778, engaged in making collections of plants. On his return in 1779 he visited England, and made the acquaintance of Sir Joseph Banks. In 1781 he was appointed demonstrator of botany at Upsala, and he succeeded the younger Linnaeus as professor of botany in 1784. He published his *Flora japonica* in 1784, and in 1788 he began to publish his travels. He completed his *Prodomus plantarum* in 1800, his *Icones plantarum japonicarum* in 1805, and his *Flora capensis* in 1813. He published numerous memoirs in the transactions of many Swedish and other scientific societies, of sixty-six of which he was an honorary member. He died near Upsala on the 8th of August 1828. A genus of tropical plants (*Thunbergia*), of the natural order Acanthaceae, which are cultivated as evergreen climbers, is named after him.

THUNDER, the noise which accompanies or follows a flash of lightning, due to the disturbance of air by a discharge of electricity (see LIGHTNING; ATMOSPHERIC ELECTRICITY and METEOROLOGY). The Old English word is *þunor*, also the name of the Scandinavian god Thor (*q.v.*), which is cognate with Dutch *donder*, German *Donner*. The root is *than*,- Indo-European *tan*-, cf. Latin *tonare*, *tonitru*. This root is apparently another form of *stan*-, as in Skr. *stan*, to sound, thunder, Gr. *στένειν*, to groan, Eng. "stun."

THUN-HOHENSTEIN. The family of Thun-Hohenstein, one of the wealthiest of the Austrian nobility, which has for more than 200 years settled at Tetschen, in Bohemia, has given several distinguished members to the Austrian public service. Of the three sons of Count Franz, the eldest, FRIEDRICH (1810–1881), entered the diplomatic service; after holding other posts he was in 1850 appointed president of the restored German Diet at Frankfort, where he represented the anti-Prussian policy of Schwarzenberg, and often came into conflict with Bismarck, who was Prussian envoy. He was afterwards ambassador at Berlin and St Petersburg. After his retirement from the public service in 1863 he supported in the Bohemian *Landtag* and the Austrian *Reichsrat* the federal policy of his brother Leo. In 1879 he was made hereditary member of the Upper House. In this position he was on his death, on the 24th of September 1881, succeeded by his eldest son FRANZ ANTON (b. 1847). Like the rest of his family, he belonged to the Federalist party, and his appointment in 1889 as governor of Bohemia was the cause of grave dissatisfaction to the German Austrians. He took a leading part in the negotiation of 1890 for the Bohemian settlement, but the elections of 1891, in which the young Czechs who were opposed to the feudal party gained a decisive victory, made his position a very difficult one. Contrary to expectation, he showed great energy in suppressing disorder; but after the proclamation of a state of siege his position became untenable, and in 1895 he had to resign. On the resignation of Badeni in 1898 he was made minister president, an office which he held for little more than a year, for, though he succeeded in bringing to a conclusion the negotiations with Hungary, the support he gave to the Czechs and Slovenians increased the opposition of the Germans to such a degree that parliamentary government became impossible, and at the end of 1899 he was dismissed.

The third son of Count Franz, LEOPOLD OR LEO (1811–1888), was one of the leading Austrian statesmen. After studying at the university of Prague he travelled through Europe, and among other countries he visited England, where he became acquainted with James Hope (afterwards Hope-Scott) and other leaders of the Tractarian party. He was much affected by the romantic movement and the Ultramontane revival, and after his return home interested himself greatly in the revival of Czech language and literature and the growth of the Bohemian national feeling. He formed a personal friendship with Palacky and others of the Czech leaders; he helped in the foundation of schools in which Czech should be taught, and set himself to acquire some knowledge of the language. He was also interested in prison reform, on which he wrote, and other philanthropic work. After serving under Stadion in Galicia, he was in 1848, after the outbreak of the revolution, appointed president of the administration and acting Stadthalter in Bohemia. He had scarcely entered on his duties when the rebellion of June broke out in Prague. In order to avoid bloodshed, he went down to the insurgents on the barricade, but was seized by them, imprisoned, and for some time his life was in danger. On his release he vigorously supported Windischgrätz, who was in command of the troops, in the restoration of order, but thereby lost his popularity and was superseded. He still defended the Bohemian national movement, and in one of his writings laid down the principle that nationality was one of the interests outside the control of the state. Notwithstanding this, in 1849 he accepted the office of minister of religion and education, which he held in 1860 under the autocratic and centralizing administration of Schwarzenberg and Bach. At first he threw himself with great energy into the task of building up an adequate system of schools. He summoned experienced teachers, Protestant as well as Catholic, from Germany, established middle and higher schools in all parts of the empire, superseded the antiquated textbooks and methods of instruction, and encouraged the formation of learned societies and the growth of a professional spirit and independence among the teachers. It is noticeable that at this time he insisted on the use of German in all schools of higher education. As minister of religion he was to a certain extent responsible for the concordat which again subjected the schools to the control of the Church: to a certain extent he thereby undid some of his work for the extension of education, and it was of him that Grillparzar said, "I have to announce a suicide. The minister of religion has murdered the minister of education." But during his administration the influence of the church over the schools was really much less than, by the theory of the concordat, it would have appeared to be. The crisis of 1860, by which the office he held was abolished, was the end of his official career; for the rest of his life he was very prominent as the leader of the Federalist party in Bohemia. His high social position, his influence at court, his character, as well as his undoubted abilities and learning, not often in Austria found in a man of his rank, gave him great influence. He supported the claims of Bohemia to a full autonomy; he strongly attacked both the February constitution and the *Ausgleich* with Hungary; what he desired was a common parliament for the whole empire based on a settlement with each one of the territories. With the old Czechs he refused to recognise the constitution of 1867; he helped to draft the declaration of 1868 and the fundamental articles of 1871, and took a leading part in the negotiations during the ministry of Potocki and Hohenwart. In order to found a strong Conservative party he established a paper, the *Vaterland*, which was the organ of the Clerical and Federalist party. It is needless to say that he protested against the ecclesiastical legislation of 1867 and 1873. He married in 1847 the countess Clàm-Martinic, but there was no issue of the marriage. He died in Vienna on the 17th of December 1888.

See the very full article by Frankfurter in the *Allgemeine deutsche Biographie*, which supersedes his earlier biography. (J. W. He.)

THURET, GUSTAVE ADOLPHE (1817–1875), French botanist, was born in Paris on the 23rd of May 1817. He came of an old Huguenot family, which had sought refuge for a time in Holland after the revocation of the Edict of Nantes. A trace of Dutch influence still persists in the pronunciation of the family name in which the final *t* is sounded. Thuret's mother was brought up in England; English was the first language that he learnt, and he appears to have retained strong sympathies with Great Britain throughout life. As a young man he studied for the law; in his leisure time he was an ardent musician, and it was from a musical friend, de Villers, that he received, in 1837, his first initiation into botany. Beginning simply as a collector, he soon came under the influence of Joseph Decaisne (1809-1882), whose pupil he became. It was Decaisne who first encouraged him to undertake those algological studies which were to become the chief work of his life. Thuret twice visited Constantinople in company with the French ambassador, M. de Pontois, and was for a time attaché to the French embassy there. His diplomatic career, though of short duration, gave him a valuable opportunity of studying the Oriental flora. After travelling in Syria and Egypt in the autumn of 1841, he returned to France. Giving up his intention of entering the civil service, he retired to his father's country house at Rentilly, and thenceforth devoted himself to scientific research. He had already, in 1840, published his first scientific paper, "Notes sur l'anthère de *Chara* et les animalcules qu'elle renferme," in which he first accurately described the organs of motion of the "animalcules" or spermatozoids of these plants. He continued his studies of the zoospores and male cells of Algae and other Cryptogams, and our exact knowledge of these remarkable motile stages in vegetable life is largely due to his labours. He spent a great part of his time, up to 1857, on the Atlantic coast of France, assiduously observing the marine Algae in their natural habitat and at all seasons. In conjunction with his friend Édouard Bornet, he became the recognized authority on this important group of plants, of which the two colleagues acquired an unrivalled knowledge. Their work, while remarkable for taxonomic accuracy, was more especially concentrated on the natural history, development and modes of reproduction of the plants investigated. The discovery of sexual reproduction in seaweeds is almost wholly the work of these two men. The researches on the fecundation of the Fucaceae were published by Thuret in 1853 and 1855; the complicated and difficult question of the sexual reproduction in Floridae was solved by the joint work of Thuret and Bornet (1867). These great discoveries—of far-reaching biological significance—stand out as the chief, but every group of marine Algae was elucidated by the researches of Thuret and his colleague. There are few scientific authors whose work has so completely stood the test of subsequent investigation and criticism. Thuret's style in expounding his results was singularly clear and concise; he was a man of wide education, and possessed the power of expressing his ideas with literary skill. Unfortunately, much of his best work remained unpublished during his life. A portion of the material accumulated by himself and his colleague was embodied in two magnificent works published after his death—the *Notes algologiques* (1876–1880), and the still finer *Études phycologiques* (1878). These volumes, as well as earlier memoirs, are illustrated by drawings of unequalled accuracy and beauty from the hand of the artist Riocreux, whom Thuret employed. In 1857 Thuret removed to Antibes on the Mediterranean coast, where, on a once barren promontory, he established a botanic garden which became famous throughout the scientific world. Since his death the Antibes establishment has been placed at the disposal of botanical workers as an institute for research. Thuret died suddenly, while on a visit to Nice, on the 10th of May 1875, when he had scarcely completed his fifty-eighth year. He was a man of considerable wealth, who devoted his money as freely as his time and labour to the advancement of science, but his high reputation rests on the brilliancy of his personal investigations.

The best and fullest account of Thuret's career is that by his friend and fellow worker Bornet, published in the *Annales des sciences naturelles* for 1876. An English notice of his life, by Professor W. G. Farlow, will be found in the *Journal of Botany* for the same year. (D. H. S.)

THURGAU (Fr. *Thurgovie*), one of the cantons of north-eastern Switzerland, bordering on the Lake of Constance and the Rhine as it issues from that lake. Its total area is 390·4 sq. m., of which 326·9 sq. m. are reckoned as "productive" (forests covering 69·3 sq. m. and vineyards 4·4 sq. m.); of the "unproductive" portion most ($59\frac{3}{4}$ sq. m.) consists of the cantonal share of the Lake of Constance. The canton is partly made up of the central portion of the valley of the Thur (which rises in the Toggenburg), with its affluent the Murg, and partly of the level stretch along the west shore of the Lake of Constance and left bank of the Rhine. Low ranges of wooded hills separate the lake from the Thur valley and the latter from that of the Murg, as well as from the cantons of Zürich and of St Gall, the highest point in the canton being situated at its southern extremity, and forming the northern slope (3271 ft.) of the Hörnli (3727 ft.), itself wholly in Zürich. The small outlying district of Horn is an "enclave" in the canton of St Gall, because it was acquired in 1463 by the bishop of Constance, who incorporated it with the bailiwick of Arbon, the fate of which it has followed. In 1798 the lower portion of the Stammheim glen was given to Zürich, as well as the Diessenhofen region to Schaffhausen, but the latter region came back to Thurgau in 1800. The main railway line from Winterthur to Romanshorn (with a branch to St Gall) runs right through the canton, while on its north edge is the direct line along the left bank of the Rhine from Constance to Schaffhausen. A network of well-made roads traverses the canton in every direction, some of them being now served by public motor cars. It is a prosperous region, the population being mainly engaged in agriculture, and in cotton-spinning, which is often combined with it at home. The orchards are so splendid that Thurgau has been called "the garden of Helvetia." The vineyards produce a number of highly esteemed wines (the best known is the red Bachtobler), which are said to retain their strength for eight or ten years, this being attributed to the influence of the east wind to which the vines are much exposed. In 1900 the population was 113,221, of whom 110,845 were German-speaking, 1867 Italian-speaking and 332 French-speaking, while there were 77,210 Protestants, 35,824 Romanists and 113 Jews. Its capital is Frauenfeld (*q.v.*), while other important places are Arbon (pop. 5677), Kreuzlingen (4732), practically a suburb of Constance, and Romanshorn (*q.v.*), the chief port of the canton on the Lake of Constance. Till 1814 it was in the diocese of Constance, and since 1828 in that of Basel. The canton is divided into eight administrative districts, which comprise 212 communes. In 1869 the very advanced existing constitution was adopted, by which the "initiative" (or right of 2500 electors to compel the cantonal assembly to take any subject into consideration), and the "obligatory referendum," taking place twice a year (by which all laws passed by the cantonal assembly, and all financial resolutions involving a capital expenditure of 50,000 francs or an annual one of 10,000, must be submitted to a popular vote), were introduced. The cantonal government consists of a legislative assembly or *Grossvat* (one member to every 250 electors, or fraction over 125) and a *Regierungsvat* or executive council of five members, both elected directly by the people and holding office for three years; 5000 electors can at any time call for a popular vote on the question of the dismissal of either one or the other. Further, to show the very democratic character of the (1869) constitution, it may be added that members of both houses of the Federal assembly are in Thurgau elected direct by the people, and hold office for three years. The "communes" in Thurgau are of no less than eleven or twelve varieties. The division of the lands, &c., of the old "burgher communes" between them and the new communes, consisting of all residents (with whom political power rests), was carried out (1872) in all the 212 communes; but there are still 38 gilds or corporations with special rights over certain forests, &c.

The Thurgau originally took in all the country, roughly speaking, between the Reuss, the Lake of Lucerne, the Rhine and the Lake of Constance; but many smaller districts (Zürichgau, Toggenburg, Appenzell, St Gall) were gradually carved out of it, and the county was reduced to about the size of the present canton when in 1264 it passed by the gift of the last count of Kyburg to his nephew Rudolph of Habsburg, chosen emperor in 1273. In 1415 the count, Duke Frederick of Austria (a Habsburg), was put under the ban of the empire by the emperor Sigismund for having aided Pope John XXIII. to escape from Constance, and the county was overrun, Sigismund in 1417 mortgaging to the city of Constance the appellate jurisdiction in all civil and criminal matters ("Landgericht" and "Blutbann") arising within the county, which he had declared to be forfeited in consequence of Frederick's conduct. In 1460 some of the Confederates, now becoming very eager for conquests, overran and seized the county. Winterthur was saved, but in 1461 Frederick's son, Duke Sigismund, had perforce to cede the county to the Confederates. Henceforth it was ruled as a "subject district" by seven members of the League—Bern occupied in the west, not being admitted to a share in the government till 1712, after one of the wars of religion. It was only in 1499 that the Confederation (then consisting of ten members) obtained from the emperor (the claims of Constance being passed over in silence) the supreme jurisdiction, through the mediation of the duke of Milan, but there were still 103 minor jurisdictions belonging to various lords spiritual (particularly the bishop of Constance, the abbot of St Gall and the abbot of Reichenau) and temporal, which went on till 1798 and greatly limited the power of the Confederates. Thurgau had hoped, but in vain, to be admitted in 1499 a full member of the Confederation.

At the time of the Reformation many of the inhabitants became Protestants, and bitter quarrels ensued between the Protestant and Catholic (the latter having a large majority) members of the Confederation who had rights over Thurgau, with regard to the toleration of the new doctrines in the "subject districts" such as Thurgau. By the first peace of Kappel (1529) the majority in each "commune" was to settle the religion of that "commune," but by the second (1531, after Zwingli's death) both religions were to be allowed side by side in each "commune." Thurgau thus became a "canton of parity," as it is to this day. Its rulers, however, continued to watch each other very closely, and Kilian Kesselring, one of the chief military commanders in Thurgau, was in 1633, on suspicion of having connived at the advance of the Swedes through Thurgau on Constance, seized by the Catholic cantons and severely punished. In 1798 Thurgau became free, and was one of the nineteen cantons of the Helvetic republic, being formally received (like the other "subject lands") as a full member of the Swiss Confederation in 1803 by the Act of Mediation. It was one of the very first cantons to revise, in 1830, after the July revolution in Paris, its constitution in a very liberal sense, and in 1831 proposed a revision of the Federal Pact of 1815. This failed, but the new Federal constitutions of 1848 (of which one of the two drafters was Kern of Thurgau) and 1874 were approved by very large majorities. In 1848 almost all of the convents in the canton were suppressed, one only (that of the Dominican nuns at St Katharinenthal) surviving till extinguished in 1869 by the new cantonal constitution, which also forbade the erection of any new religious houses. In 1849 the cantonal constitution was revised and the veto introduced, by which the people might reject a bill passed by the cantonal assembly. The castle (modern) of Arenenberg, above the western arm of the Lake of Constance, belonged to the Napoleonic family from 1817 to 1843, and was repurchased by them in 1855. It contains many relics of Napoleon III., whose widow, the ex-empress Eugénie, in 1906 presented it (with provision for annual masses in the chapel) to the canton of Thurgau, which has converted it into an agricultural college.

THURIBLE (Lat. *thuribulum* or *turibulum*, *thus* or *tus*, incense, Gr. θυός, from θυέιν, to offer a burnt sacrifice, cf. Skr. *dhūma* and Lat. *fumus*, smoke), the ecclesiastical term for a censer, a portable vessel in which burning incense (*q.v.*) can be carried. The censer, to use the more general term, is a vessel which contains burning charcoal on which the aromatic substances to be burned are sprinkled. The early Jewish portable censer would seem to have been a bowl with a handle, resembling a ladle. A similar form was used by the ancient Egyptians long prior to the Jewish use. There are very numerous representations on the monuments; in some the censer appears as a small cup or bowl held by a human hand to which a long handle is attached on which is a small box to hold the incense. The Greek and Roman censers (*θυμιατήριον* and *turibulum* or *thuribulum*) are of quite different shape. They are small portable braziers (*foculi*) of bronze or sometimes of silver and of highly ornate design. One type took the form of a candelabrum with a small flat brazier on the top. They were carried in processions and were lifted by cords. Terra cotta censers have also been found of a similar shape. The censers or thuribles in Christian usage have been specially adapted to be swung, though there are in existence many early specimens of heavy weight and made of gold or silver which were obviously not meant to be used in this way and have handles and not chains. The thurible, the proper ecclesiastical term for the vessel in the Western Church, is usually spherical in form, though often square or polygonal, containing a small receptacle for the charcoal and covered by a perforated lid; it is carried and swung by three chains, a fourth being attached to the lid, thus allowing it to be raised at intervals for the volume of smoke to be increased. The early thuribles were usually simple in design; but in the medieval period an architectural form was given to the lids by ornamenting them with towers, battlements and traceries, varying according to the prevalent Gothic style of the period. A censer lid with a late Saxon tower upon it, now in the British Museum, dates from the 12th century or earlier.

THURII, or THURIUM, a city of Magna Graecia on the Gulf of Tarentum, near the site of the older Sybaris (*q.v.*). It owed its origin to an attempt made in 452 B.C. by Sybarite exiles and their descendants to repeople their old home. The new settlement was crushed by Crotona, but the Athenians lent aid to the fugitives and in 443 Pericles sent out to Thurii a mixed body of colonists from various parts of Greece, among whom were Herodotus and the orator Lysias. The pretensions of the Sybarite colonists led to dissensions and ultimately to their expulsion; peace was made with Crotona, and also, after a period of war, with Tarentum, and Thurii rose rapidly in power and drew settlers from all parts of Greece, especially from Peloponnesus, so that the tie to Athens was not always acknowledged. The oracle of Delphi determined that the city had no founder but Apollo, and in the Athenian War in Sicily Thurii was at first neutral, though it finally helped the Athenians. Thurii had a democratic constitution and good laws, and, though we hear little of its history till in 390 it received a severe defeat from the rising power of the Lucanians, many beautiful coins testify to the wealth and splendour of its days of prosperity. In the 4th century it continued to decline, and at length called in the help of the Romans against the Lucanians, and then in 282 against Tarentum. Thenceforward its position was dependent, and in the Second Punic War, after several vicissitudes, it was depopulated and plundered by Hannibal (204). In 194 a Roman colony was founded, with Latin rights, known for a time as Copiae, but afterwards by the old name of Thurii. It continued to be a place of some importance, the situation being favourable and the region fertile, and does not seem to have been wholly abandoned till the middle ages. The site of the original Greek city is not accurately known, though that of the Roman town, which probably though not certainly occupied the same site, is fixed by insignificant ruins as being 4 m. to the east of Terranova di Sibari, and as occupying an area some 4 m. in circuit. The tombs found in 1879–1880 (see SYBARIS) lie a little to the east of the site.

See F. Lenormant, *La Grande-Grèce* i. 317 (Paris, 1881). (T. As.)

THURINGIA (German *Thüringen*), an historical division of Germany, but now a territorial term without political significance. It strictly designates only that district in upper Saxony that is bounded by the Werra, the Harz Mountains, the Saale and the Thuringian Forest; in common parlance, however, it is frequently used as equivalent to the Thuringian states, *i.e.* the group of small duchies and principalities lying between Prussia, Hesse-Nassau, Bavaria and the kingdom of Saxony. Such Thuringian states are Saxe-Weimar-Eisenach, Saxe-Coburg-Gotha, Saxe-Meiningen, Saxe-Altenburg, Schwarzburg-Rudolstadt, Schwarzburg-Sondershausen, and the two principalities of Reuss, all of which are separately described. Besides these, the term Thuringia also, of course, includes the various "exclaves" of Prussia, Saxony, Bavaria and Bohemia which lie embedded among them.

The Thuringians are first mentioned by Vegetius Renatus about A.D. 420 when they occupied the district between the Harz Mountains and the Thuringian Forest. They were probably descended from the Hermunduri, a Suevic people referred to by Tacitus as living in this region during the 1st century. They were tributary to Attila the Hun, under whom they served at the battle of Châlons in 451. They were governed by kings, whose realm in the early 6th century touched both the Danube and the lower Elbe. At this time King Basin divided Thuringia among his three sons. The eldest, Hermannfried, eventually obtained sole possession by the help of Theuderich I., king of Austrasia, but having refused to pay the price he had promised for this assistance, was defeated by Theuderich in a series of battles and murdered by him in 531. The northern portion of the kingdom was given to the Saxons who had joined him against Hermannfried; the southern part was added to Austrasia; and the name of Thuringia was confined to the district bounded by the Harz Mountains, the Werra, the Thuringian Forest and the Saale. It remained under the direct rule of the Frankish kings until 634, when Radulf was appointed duke of the Thuringians by King Dagobert I. Radulf made himself practically independent of the Franks, in spite of an attack made on him by Sigebert III., king of Austrasia. About this time the conversion of the Thuringians to Christianity was begun by British missionaries and continued by St Boniface, who founded a bishopric at Erfurt. They were again reduced to dependence on the Franks by Charles Martel, who abolished the office of duke and divided the country among Frankish counts. About 804 Charlemagne, in order to defend the line of the Saale against the Slavs, founded the Thuringian mark, which soon became practically coextensive with the former duchy. In 849 King Louis the German recognized Thakulf as duke (*dux Sorabici limitis*), and some of his successors bore the title of margrave until the death of Burkhard in 908, when the country was seized by Otto the Illustrious, duke of Saxony. Thuringia was retained by Otto's son and successor, Henry I. the Fowler, in spite of the opposition of the German king, Conrad I., and ceased for a time to enjoy a separate political existence. It appears to have been united with Meissen for some time, and this was certainly the case from 1046 to 1067, when both countries were ruled by William and Otto, counts of Weimar. During the 11th century the Thuringians refused to pay tithes to Siegfried, archbishop of Mainz, and this was probably one reason why they joined the rising of the Saxons against the emperor Henry IV. in 1073.

About this time a new dominion was founded by Louis the Bearded, who by purchase, gift or marriage obtained several counties in Thuringia. These passed on his death in 1056 to his son Louis the Springer (d. 1123), who took part in the Saxon risings against the emperors Henry IV. and Henry V., built the castle of the Wartburg near Eisenach, which was the residence of his family for nearly 200 years, and founded the monastery of Reinhardsbrunn, where as a monk he passed his last days. His son Louis was appointed landgrave of Thuringia in 1130 by the emperor Lothair II.; by his marriage with Hedwig of Gudensberg in 1137 he obtained a large part of Hesse. He was succeeded in 1140 by his son Louis II. the Hard, who married Judith, a sister of the emperor Frederick I., and on his behalf took a leading part in the opposition to his powerful neighbour Henry the Lion, duke of Saxony. In 1172 he was succeeded by his son Louis III. the Pious. He acquired the Saxon palatinate in 1179, on the death of Adalbert, count of Sommerschenburg, went to Italy to assist Frederick I. in 1157, joined in the war against Henry the Lion in 1180, and distinguished himself at the siege of Acre in the Third Crusade, on the return from which he died at Cyprus in 1190. He was succeeded by his brother Hermann I., during whose reign Thuringia suffered greatly from the ravages of the adherents of Philip, duke of Swabia, and also from those of his rival Otto of Brunswick. The next landgrave (1217–1227) was his son Louis IV. the Saint, who married St Elizabeth, daughter of Andrew II., king of Hungary, and acted as guardian for his kinsman Henry III. the Illustrious, margrave of Meissen. This Louis, who is celebrated in story, destroyed many robber-castles in Thuringia and died at Otranto while accompanying the emperor Frederick II. on crusade. The next ruler was Henry Raspe, who made himself regent on behalf of his nephew Hermann II. from 1227 to 1238 and in 1241 succeeded his former ward as landgrave. Henry was appointed regent for King Conrad IV., but he soon transferred his allegiance from the emperor to Pope Innocent IV., and in 1246 was chosen German king at Beitshochheim. He defeated Conrad near Frankfort in August 1246, but died in the following year at the Wartburg, when the male line of the family became extinct.

In 1242 Thuringia had been promised by Frederick II. to Henry III. the Illustrious, margrave of Meissen, a maternal grandson of the landgrave Hermann I. Henry, however, found himself obliged to defend his title against Sophia, wife of Henry II., duke of Brabant, who was a daughter of the landgrave Louis IV., and it was not till 1263 that an arrangement was made by which Thuringia and the Saxon palatinate fell to Henry. Two years later Henry apportioned Thuringia to his son Albert the Degenerate, who sold it in 1293 to the German king Adolph of Nassau for 12,000 marks of silver. Albert's sons Frederick the Undaunted and Dietrich contested this transaction, and the attempts of Adolph and his successor Albert I. to enforce it led to the infliction of great hardships upon the Thuringians. Frederick defeated Albert decisively and in 1314 was formally invested with Thuringia by the emperor Henry VII. His son Frederick II. the Grave (1323–1349) consolidated the power of his dynasty against rebellious vassals and the neighbouring counts of Weimar and Schwarzburg. His son Frederick III. the Strong (1349–1381) and his grandson Balthasar (1381–1406) further extended their dominion by marriage and conquest, and the latter of these founded the university at Erfurt (1392). Balthasar's son, Frederick the Peaceful, became landgrave in 1406 but left the government largely to his father-in-law Günther, count of Schwarzburg. He died childless in 1440, and Thuringia then passed to the electoral dynasty of Saxony. After a joint rule by Frederick II. and his brother William, the latter in 1445 became sole landgrave as William III. and died without sons in 1482. In 1485 his nephews and heirs Albert and Ernest made a division of their lands, and Thuringia was given to the Ernestine branch of the family of Wettin, with which its subsequent history is identified (see SAXONY).

THURINGIAN FOREST (*Thüringerwald*), a range of hills in Germany, extending in an irregular line from the neighbourhood of Eisenach in the N.W. to the Lobensteiner Kulm on the Bavarian frontier on the S.E. On the S.E. it is continued directly by the Frankenwald Mountains to the Fichtelgebirge, while on the N.E. it approaches the Harz Mountains, and thus takes its place in the great Sudetic chain of central Germany. The length of the Thuringian chain is 70 m., and its breadth varies from 6 to 22 m. It nowhere rises into peaks, and only a few of its rounded summits reach 3000 ft.; the successive hills form a continuous comb; the north-west slopes are precipitous and seamed with winding gorges. This range encloses many charming valleys and glens; the most prominent feature of its scenery is formed by the forests, chiefly of pines and firs. The north-west part of the system is the loftier and the more densely wooded as well as the more beautiful; the highest summits here are the Grosser Beerberg (3225 ft.), Schneekopf (3203) and the Finsterberg (3104), all in the duchy of Gotha. The south-east part of the Thuringian Forest is the more populous and industrial; the chief summits are the Kieferle (2848 ft.), the Blessberg (2834 ft.), the Wurzelberg (2841 ft.) and the Wetzstein (2575 ft.). The crest of the Thuringian Forest, from the Werra to the Saale, is traversed by the Rennsteig or Rainsteig, a broad path of unknown antiquity, perhaps referred to in a letter of Pope Gregory III. dated 738. The name means probably "frontier-path"; and the path marks in fact the boundary between Thuringia and Franconia. It may be also regarded as part of the boundary line between north and south Germany, for dialect, customs, local names and costume are different on the two sides. The rocks are largely volcanic, the stratification being complex. The mineral resources have been nearly exhausted, but the district is an important centre of small industries (glassware, earthenware, meerschaum-ware, iron castings and toys being among its principal products) and a favourite resort for tourists.

(Stuttgart, 1891); Walther, *Geologische Heimatskunde von Thüringen* (Jena, 1906); and Meyer's *Reisebuch*, "Thüringen" (18th ed., Leipzig, 1906).

THURLES, a market town of Co. Tipperary, Ireland, pleasantly situated on the Suir, and on the main line of the Great Southern & Western railway, 87 m. S.W. of Dublin. Pop. (1901), 4411. Thurles is the seat of the Roman Catholic archdiocese of Cashel; and the cathedral of St Patrick is a beautiful building. The town is the seat of other important Catholic establishments, including an Ursuline convent; a Presentation convent; St Patrick's Catholic College (1829) for ecclesiastical students, where was held in 1850 the synod of Thurles; and an establishment of Christian Brothers, who devote themselves to the instruction of boys on the Lancasterian method. The town has a considerable agricultural and retail trade, and there is a monthly horse fair largely attended by English and continental buyers. Thurles is governed by an urban district council.

Originally the town was called Durlas O'Fogarty. In the 10th century it was the scene of a defeat of the Irish by the Danes. A preceptory was founded here by the Knights Templars, who possessed themselves of a castle, of which there are remains, erected early in the 13th century. A castle was subsequently erected by James Butler, first lord palatine of Tipperary, of which the keep collapsed in 1868. There were several other strongholds in the vicinity. South-west of the town, at a distance of $3\frac{1}{2}$ m., stands the Cistercian abbey of Holy Cross, one of the finest ruins in Ireland. It was founded by Donnell O'Brien, king of Thomond (1168–1194); and owes its foundation and name to the presentation to his family of a portion of the true Cross, which attracted numerous pilgrims. The shrine of this relic is in the Ursuline convent at Blackrock, Co. Cork. The ruins, beautifully placed on the bank of the river, embody a cruciform church, transitional Norman in style, and exhibiting the carving of the period in its highest development. There is a fine Perpendicular tomb in the choir. A large portion remains of the adjoining buildings, including chapter-house, sacristy, cloisters and dormitory.

THURLOE, JOHN (1616–1668), English politician, son of Thomas Thurloe, rector of Abbot's Roding in Essex, was baptized on the 12th of June 1616. He studied law, entered the service of Oliver St John, through whose interest he was appointed a secretary to the parliamentary commissioners at Uxbridge in January 1645. He was admitted to Lincoln's Inn in 1647, and in March 1648 he received the appointment of receiver of the cursitor's fines, worth £350 a year. He took no part in the subsequent historical events or in the king's death. In March 1651 he attended St John and Sir Walter Strickland as secretary in their mission to Holland, and on the 29th of March 1652 he was appointed secretary to the council of state, being apparently also elected a member thereof about the same time. His duties included the control of the intelligence department and of the posts, and his perfect system of collecting information and success in discovering the plans of the enemies of the administration astonished his contemporaries. By his means, it was said, "Cromwell carried the secrets of all the princes of Europe at his girdle." On the 10th of February 1654 he was made a bencher of Lincoln's Inn. In the parliaments of 1654 and of 1656 he represented Ely; he was appointed a member of Cromwell's second council in 1657; was elected a governor of the Charterhouse in the same year; and in 1658 became chancellor of Glasgow University. Thurloe was attached to Cromwell as a man and admired him as a ruler, and Cromwell probably placed more confidence in the secretary than in any one of those who surrounded him. Thurloe, however, by no means directed Cromwell's policy. He was in favour of the protector's assumption of the royal title, and was opposed to the military party who obtained the ascendancy. After Oliver's death he supported Richard Cromwell's succession and took a prominent part in the administration, sitting in the parliament of January 1659 as member for Cambridge University. Attacked by the republicans on the ground of arbitrary imprisonments and transportations during the Protectorate, he succeeded in vindicating his conduct; but the breach between the army and the parliament, and the ascendancy obtained by the former, caused his own as well as Richard's downfall. Nevertheless, being indispensable, he was reappointed secretary of state on the 27th of February 1660. He appears to have steadily resisted the Restoration, and his promises of support to Hyde in April inspired little confidence. On the 15th of May 1660 he was arrested on the charge of high treason, but was set free on the 29th of June, subject to the obligation of attending the secretaries of state "for the service of the state whenever they should require." He subsequently wrote several papers on the subject of foreign affairs for Clarendon's information. He died on the 21st of February 1668 at his chambers in Lincoln's Inn, and is buried under the chapel there. Thurloe was twice married, and by his second wife Anne, daughter of Sir John Lytcote of East Moulsey in Surrey, he had four sons and two daughters.

His extensive correspondence, the originals of which are in the Bodleian Library at Oxford and the British Museum (*Add. MSS.* 4156, 4157, 4158), is one of the chief sources of information for the period. A portion was published with a memoir by T. Birch in 1742, and other correspondence is printed in R. Vaughan's *Protectorate of Oliver Cromwell* (1836). See also *Die Politik des Protectors Oliver Cromwell in der Auffassung und Thätigkeit . . . des Staatssecretärs John Thurloe*, by Sigismund, Freiherr von Bishoffshausen (1899); *Eng. Hist. Review*, xiii. 527 (Thurloe and the post office); *Notes and Queries*, 11th series, vol. viii. p. 83 (account of his death); *A Letter to a Friend . . . on the Publication of Thurloe's State Papers* (1742); Clarendon's *History of the Rebellion*; Gardiner's *History of the Commonwealth.*

THURLOW, EDWARD THURLOW, 1ST BARON (1731–1806), English lord chancellor, was born at Bracon Ash, in the county of Norfolk, on the 9th of December 1731. He was the eldest son of the Rev. Thomas Thurlow. He was educated at a private school and at the grammar school of Canterbury, where he was considered a bold, refractory, clever boy. In 1748 Thurlow entered Caius College, Cambridge, but an act of insubordination necessitated his leaving Cambridge without a degree (1751). He was for some time articled to a solicitor in Lincoln's Inn along with the poet Cowper, but in 1754 was called to the bar at the Inner Temple, and subsequently went on the western circuit—at first with little success. But in the case of *Luke Robinson* v. *The Earl of Winchelsea* (1758) Thurlow came into collision with Sir Fletcher Norton, afterwards 1st Baron Grantley (1716–1789), then the terror of solicitors and the tyrant of the bar, and put down his arrogance with dignity and success. From this time his practice increased rapidly. In 1761 he was made a king's counsel, through the influence of the duchess of Queensberry. In 1762 he was elected a bencher of the Inner Temple. Thurlow now with some hesitation entered himself into the ranks of the Tory party. In 1768 he became member for Tamworth. In 1769 the Douglas peerage case came on for hearing in the House of Lords, and Thurlow, who had drawn the pleadings some years before (*Notes and Queries*, 3rd series, vol. iii. p. 122), led for the appellant in a speech of great analytic power. In 1770, as a recognition of his defence in the previous January of the expulsion of Wilkes, Thurlow was made solicitor-general on the resignation of Dunning, and in the following year, after he had enhanced his reputation with the government by attacking the rights of juries in cases of libel (*Rex* v. *Miller*, 20 *St. Tr.* 870–896) and the liberty of the press (16 *Parly. Hist.* 1144), was raised to the attorney-generalship. Thurlow's public life was as factious as his youth had been daring. His hatred of the American colonists, and his imprudent assertion that as attorney-general he might set aside by *scire facias* as forfeited every charter in America (debate on the American Prohibitory Bill, 18 *P.H.* 999); his speech in aggravation of punishment in the case of Horne Tooke (20 *St. Tr.* 777–783), when he argued that the prisoner ought to be pilloried, because imprisonment was no penalty to a man of sedentary habits and a fine would be paid by seditious subscription; and his opposition to all interference with the slave trade—are characteristic. In 1778 Thurlow became lord chancellor and Baron Thurlow of Ashfield, and took his seat in the House of Lords, where he soon acquired an almost dictatorial power. He opposed the economical and constitutional reforms proposed by Burke and Dunning. Under Rockingham he clung to the chancellorship, while conducting himself like a leader of the opposition. To the short-lived ministry of Shelburne he gave consistent support. Under the coalition of Fox and North (April to December 1783) the great seal was placed in commission, and Lord Loughborough was made first commissioner. But Thurlow, acting as the king's adviser, and in acccordance with his wishes, harassed the new ministry, and ultimately secured the rejection of Fox's India Bill (24 *P.H.* 226). The coalition was at once dissolved. Pitt accepted office, and Thurlow again became lord chancellor (Dec. 23, 1783). At first he supported the government, but soon his overbearing temper asserted itself. Imprudently relying on the friendship of the king, and actuated by scarcely disguised enmity to Pitt, Thurlow passed rapidly from occasional acts of hostility to secret disaffection, and finally to open revolt. He delivered himself strongly against a bill, introduced without his privity, for the restoration to the heirs of attainted owners of estates forfeited in the Jacobite rebellion of 1745. Partly to please the king and queen, partly from dislike to Burke, and partly perhaps from a real belief in the groundlessness of the accusation, he supported Warren Hastings on every occasion "with indecorous violence." His negotiations with the Whigs during the discussion of the Regency Bill (1788–Feb. 19, 1789) were designed to secure his seat on the woolsack in the event of Fox being called to power. The climax was reached in 1792, when he attacked Pitt's bill "to establish a sinking fund for the redemption of the national debt," not on account of the economic objections to which it was liable, but on the trivial ground that it was an unconstitutional attempt to bind further parliaments. The bill was carried, but only by a narrow majority, and Pitt, feeling that co-operation with such a colleague was impossible, insisted successfully on his dismissal (June 15, 1792). The ex-chancellor, who had a few days before been created Baron Thurlow of Thurlow, with remainder to his brothers and their male descendants, now retired into private life, and, with the exception of a futile intrigue, under the auspices of the prince of Wales, for the formation of a ministry from which Pitt and Fox should be excluded, and in which the earl of Moira should be premier and Thurlow chancellor (1797), finally abandoned hope of office. In 1795 he opposed the Treason and Sedition bills without success. In 1801 he spoke on behalf of Horne Tooke—now his friend—when a bill was introduced to render a priest in orders ineligible for a seat in the House of Commons. His last recorded appearance in the House of Lords was in 1802. He now spent his time between his villa at Dulwich and various seaside resorts. He died at Brighton on the 12th of September 1806, and was buried in the Temple church. Thurlow was never married, but left three natural daughters, for whom he made a handsome provision. The title descended to his nephew, son of the bishop of Durham.

Lord Thurlow was a master of a coarse caustic wit, which habitually in his private and too frequently in his public life displayed itself in profanity. He was a good classical scholar and made occasional translations in verse from Homer and Euripides. His judicial and his ecclesiastical patronage were wisely exercised; he was the patron of Dr Johnson and of Crabbe, and was the first to detect the great legal merits of Eldon. Thurlow's personal appearance was striking. His dark complexion, harsh but regular features, severe and dignified demeanour, piercing black eyes and bushy eyebrows, doubtless contributed to his professional and political eminence and provoked the sarcasm of Fox that he *looked* wiser than any man ever *was*. Yet he was far from being an impostor. By intense though irregular application he had acquired a wide if not a profound knowledge of law. Clear-headed, self-confident and fluent, able at once to reason temperately and to assert strongly, capable of grasping, rapidly assimilating, and forcibly reproducing minute and complicated details, he possessed all the qualities which command success. His speeches in the trial of the duchess of Kingston for bigamy (20 *St. Tr.* 355–651) are vigorous and effective, while his famous opening in the Douglas peerage case and his argument for the Crown in *Campbell* v. *Hall* (20 *St. Tr.* 312–316) show that he might have rendered high service to the judicial literature of his country had he relied more upon his own industry and less upon the learning of Hargrave and Kenyon.

W. R.)

THURMAN, ALLEN GRANBERY (1813–1895), American jurist and statesman, was born at Lynchburg, Virginia, on the 13th of November 1813. In 1819 he removed with his parents to Chillicothe, Ohio, where he attended the local academy for two years, studied law in the office of his uncle, William Allen,[1] and in 1835 was admitted to the bar, becoming his uncle's law partner. He began to take an active part in politics in 1844, and in 1845–1847 was a Democratic representative in Congress, where he advocated the Wilmot Proviso. From 1851 to February 1856 he was an associate justice of the state supreme court, and from December 1854 was chief justice. He was Democratic candidate for governor of Ohio in 1867, and was defeated by Rutherford B. Hayes by a majority of less than 3000 votes; but the Democrats gained a majority in both branches of the state legislature, and Thurman was elected to the United States Senate, where he served from 1869 until 1881—during the 46th Congress (1879–1881) as president *pro tempore*. Here he became the recognized Democratic leader and in 1879–1881 was chairman of the judiciary committee. He contested the constitutionality of the Civil Rights Bill, opposed the resumption of specie payments, advocated the payment of the public debt in silver and supported the Bland-Allison Act. He introduced the Thurman Bill, for which he was chiefly responsible, which became law in May 1878, and readjusted the government's relations with the bond-aided Pacific railways. Thurman was a member of the Electoral Commission of 1877, and was one of the American delegates to the international monetary conference at Paris in 1881. In 1876, 1880 and 1884 he was a candidate for the presidential nomination, and in 1888 was nominated for vice-president on the ticket with Grover Cleveland, but was defeated in the election. He died at Columbus, Ohio, on the 12th of December 1895.

THURSDAY ISLAND, one of the smallest of the Prince of Wales group, N. of Cape York, in the Torres Strait, attached to Somerset county, Queensland, Australia. Pop. (1901), 1534. It has an excellent harbour, Port Kennedy, and is a port of call for mail steamers and the centre of the bêche-de-mer and pearl fisheries of the Torres Strait. It is a fortified coaling station for the British navy. The neighbouring Friday Island is the quarantine and leper station for Queensland.

THURSO, a municipal and police burgh, and seaport of Caithness, Scotland. Pop. (1901), 3723. It is situated at the mouth of the Thurso, on Thurso Bay, 21 m. N.W. of Wick, and 319 m. N. of Edinburgh by the North British and Highland railways, the most northerly town in Scotland. Coaches run daily to Mey and Wick and every day a mail-car goes to Tongue, in Sutherlandshire, about 40 m. west.

In Macdonald Square, laid out with ornamental walks, there is a statue of Sir John Sinclair. A promenade along the sands was opened in 1882. The town-hall contains a public library and museum, which possesses the geological and botanical specimens of Robert Dick (1811–1866), the "Thurso baker," as well as a large collection of northern birds. In the neighbourhood are quarries for Caithness flags, which are cut and dressed in the town. They constitute the leading export, but the trade of the port is hindered by the inconvenience of the harbour. There is, however, communication daily from Scrabster pier, 2 m. north-west, with Scapa and Stromness in Pomona (Orkneys), calling at Hoxa; once a week with Wick, Aberdeen and Leith; and occasionally in summer with Liverpool. To the east is Thurso Castle, the residence of the Ulbster branch of the Sinclairs, and near it is Harold's Tower, built over the grave of Earl Harold, once owner of half of Caithness, and half of the Orkneys and Shetlands, who fell in battle with Earl Harold the Wicked in 1190. About three-quarters of a mile west stand the ruins of the bishop's palace, which was destroyed by fire in 1222. Thurso was the centre of the Norse power on the mainland when at its height under Thorfinn (1014), and afterwards till the battle of Largs (1263). Count Modach, nephew of King Duncan, quartered his army for a time at Thurso and despoiled it till he was surprised and slain by Thorfinn in 1040. In the time of Malcolm II. Earl Erlend resided in the town. In 1633 it was created a burgh of barony, and was the seat of the sheriff courts of the county till they were removed to Wick in 1828.

THURSTAN, or TURSTIN (d. 1140), archbishop of York, was the son of a certain Anger, or Auger, prebendary of St Paul's, London, and a brother of Audoen (d. 1139), bishop of Evreux. He himself was a prebendary of St Paul's, and was also a clerk in the service of William II. and then of Henry I., who secured his election as archbishop of York in August 1114. He now entered upon the great controversy which occupied him during a large part of his subsequent life and made him for several years an exile from England. Archbishop Ralph of Canterbury refused to consecrate him unless he made a profession of obedience to the southern see; this Thurstan refused and asked the king for permission to go to Rome to consult Pope Paschal II. Henry I. declined to allow him to make the journey, while Paschal declared against Archbishop Ralph. At the Council of Salisbury in 1116 the English king ordered Thurstan to submit, but instead he resigned his archbishopric, although this did not take effect. The new pope, Gelasius II., and also his successor, Calixtus II., espoused the cause of the stubborn archbishop, and in October 1119, in spite of promises made to Henry I., he was consecrated by Calixtus at Reims. Enraged at this the king refused to allow him to enter England, and he remained for some time in the company of the pope. At length, however, his friends succeeded in reconciling him with Henry; and, after serving the king in Normandy, he was recalled to England, which he entered early in 1121. Refusing to recognize the new archbishop of Canterbury, William of Corbeil, as his superior, Thurstan took no part in his consecration, and on two occasions both archbishops carried their complaints in person to Rome. In 1138 he made a truce at Roxburgh between England and Scotland, and took active part in gathering together the army which defeated the Scots at the Battle of the Standard

[1] William Allen (1806–1879), a native of North Carolina, removed in 1822 to Chillicothe, Ohio, was admitted to the bar in 1827, was a representative in Congress in 1833–1835, served in the United States Senate in 1837–1849, and was governor of Ohio in 1874–1875.

in August 1138. Early in 1140 he entered the order of the Cluniacs at Pontefract and here he died on the 6th of February 1140. Thurstan was generous to the churches of his diocese and was the founder of several religious houses.

See his life in the *Fasti eboracenses*, edited by J. Raine (1863).

THYLACINE (*Thylacinus cynocephalus*). The only known living species of this genus, though smaller than a common wolf, is the largest predaceous marsupial existing. It is confined to the island of Tasmania, although fragments of bones and teeth found in caves afford evidence that a closely allied species once inhabited the Australian mainland. The general colour of the thylacine is grey-brown, but it has a series of transverse black bands on the hinder part of the back and loins, whence the name of "tiger" frequently applied to it by the colonists. It is also called "wolf," and sometimes, though less appropriately, "hyena." Owing to the havoc it commits among the sheep-folds, it has been nearly exterminated in all the more settled parts of Tasmania, but still finds shelter in the more mountainous regions of the island. The female produces four young at a time. (See MARSUPIALIA.)

THYME. The genus *Thymus* (nat. ord. Labiatae) comprises a number of fragrant aromatic undershrubs, with very small leaves and whorls of small purple honey-bearing flowers in the axils of the leaves or at the ends of the branches. The common garden thyme, a native of the Mediterranean region, is *Thymus vulgaris*; the wild thyme of English banks is *T. serpyllum*. Marjoram (*Origanum*) is also closely allied. All these plants are remarkable for their essential oil, to which their fragrance is due. From this oil is produced by distillation the substance known as thymol.

THYMOL, $C_{10}H_{14}O$ or $C_6H_3(OH)(CH_3)(C_3H_7)$ [1:3:6], a methylisopropylphenol isomeric with carvacrol (*q.v.*), is an aromatic substance found with the hydrocarbons cymene, $C_{10}H_{14}$, and thymene, $C_{10}H_{16}$, in oil of thyme (from *Thymus vulgaris*) and in other essential oils, *e.g. Carum copticum*, from which it may be extracted by shaking with potassium hydroxide, filtering and precipitating the phenol with hydrochloric acid. It can be prepared from dibrom-menthone (obtained by brominating menthone in chloroform solution) by eliminating two molecules of hydrobromic acid. Thymol crystallizes in large colourless plates, which melt at 44° and boil at 230°. On distillation with phosphorus sulphide it gives cymene.

Thymol has a strong odour of thyme and a pungent taste, and is freely soluble in alcohol, ether, chloroform or olive oil, but almost insoluble in cold water. It is a more powerful antiseptic than carbolic acid, but its insolubility prevents its being used for the same purposes. A saturated solution (1 in 1000 of warm water), thymol gauze and an ointment are used. Externally it is anti-parasitic, and is used in certain stages of eczema and psoriasis, and the alcoholic solution has been used in ringworm; internally it has been employed as an intestinal antiseptic in typhoid fever. Its chief use is as an anthelmintic to destroy the *Ankylostoma duodenale*. Thymol may colour the urine green. Thymol iodide, official in the United States, is a compound of iodine and thymol; it is also known as aristol or annidalin. It was introduced as a substitute for iodoform and is stated to be less toxic. *Glycothymolin* is a proprietary preparation, used in the treatment of catarrhal conditions of mucous membranes, while a mixture of naphthalene, camphor and thymol is sold under the name of thymolin.

THYROID (Gr. θυροειδής, shield-shaped, from θυρεός, a large oblong shield, shaped like a door, θύρα, and εἶδος, form), in anatomy, a term applied (1) to the largest of the cartilages of the larynx (see RESPIRATORY SYSTEM), (2) to one of two arteries which lie near the thyroid cartilage and gland (see ARTERIES), and (3) to a vascular ductless gland, which rests on the larynx and upper part of the trachea (see DUCTLESS GLANDS). The thyroid gland is used in medicine in two forms. *Thyroideum siccum* is a light dull brown powder, prepared by drying the thyroid gland of a sheep. Its chief constituent is a proteid known as thyreoglobulin, the active principle of which contains 9·3% of iodine and 0·5% of phosphorus, and is known as iodothyrin or thyroiodin. The dried gland easily becomes damp and deteriorates. *Liquor thyroidei* is a pink turbid liquid made by macerating the fresh gland of a sheep with glycerin and phenol.

Thyroid gland administered to man increases the pulse rate, causes increased and enfeebled cardiac beat and leads to increased metabolism, consequently excess of urea, uric acid and phosphates are excreted in the urine; it therefore reduces the body weight. Glycosuria develops from the inability of the body to ingest glucose. Overdoses of thyroid cause rapid pulse, headache and vomiting, together with diarrhoea and pruritus, emaciation and weakness. These symptoms are known as *thyroidism*.

Thyroid gland was introduced for the treatment of patients suffering from goitre, myxoedema and cretinism, in which diseases it has been remarkably successful, cretins growing rapidly under the thyroid treatment and developing intelligence. It has also been used in dwarfism, excessive obesity, psoriasis and scleroderma. When used in obesity an excess of nitrogenous food should be taken to balance the destruction of proteid. In certain forms of insanity, melancholia and climacteric insanities it has given good results. Full doses of thyroid are valuable in the prevention and relief of eclampsia. It should not be given to patients suffering from exophthalmic goitre, for which an anti-thyroid serum (anti-thyreoidin of Moebius), which is the serum of thyroidectomized animals, has been introduced.

Rodagen is a white powder consisting of the dried milk of thyroidectomized goats, mixed with 50% of milk sugar. In exophthalmic goitre this preparation causes a reduction of the swelling and of the pulse rate, and an increase of body weight.

THYROSTRACA, an order of Crustacea, comprising barnacles, acorn shells and some allied degenerate parasites. The embryos are free-swimming, active forms, but in adult life the animals are fixed head downwards, and are very degenerate. The body is indistinctly segmented, and is enveloped in a fold of the integument, usually with calcareous plates. The anterior antennae are fused with the anchoring attachment, whilst the posterior pair is vestigial, and the appendages of the mouth and body present various degrees of degeneration and specialization. In most cases the adults are hermaphrodite, but unisexual forms also occur, whilst the hermaphrodite adults may carry with them minute "complementary" males. In strong contrast with the condition in most Crustacea, the spermatozoa are mobile. As shown by Burmeister in his historical review (1834), these animals, comprised by Linnaeus in the genus *Lepas*, first received a more comprehensive title from Cuvier, who called them Cirrhopoda, a word strictly meaning tawny-footed. Lamarck in 1809 altered this into the hybrid form Cirrhipoda, meaning curl-footed, which was subsequently improved into Cirripedia or Cirrhipedia. So long as the group was held to be a subordinate member of the Entomostraca, this term, though not the earliest, was generally accepted. The name Thyrostraca, meaning doorshells or valve-shells, is preferred as agreeing in termination with the titles of the other two divisions, the Malacostraca and Entomostraca. The group may conveniently be arranged in two principal sections—the Genuina with cirrhiform feet, and the Anomala without them.

Thyrostraca genuina.—It is with these that Darwin's classical treatises (*Ray Soc.* and *Palaeont. Soc.*, 1851–1854) are almost exclusively concerned. Therein an order Thoracica comprehends the pedunculate Lepadidae, together with the operculate and sessile Balanidae and Verrucidae; a single species without cirrhi constitutes the order Apoda, and a single species with only three pairs of cirrhi the order Abdominalia. Within the last *Kochlorine* (Noll, 1872) with two species, and *Lithoglyptes* (Aurivillius, 1892) with three species, have since been included. But H. J. Hansen (*Die Cirripedien der Plankton-Expedition*, 1899) states that *Cryptophialus minutus*, for which the order Abdominalia was founded, has, like *Alcippe* and other Genuina, its cirrhi on the thorax, not, as Darwin wrongly supposed, on the abdomen. In place, therefore, of the Abdominalia, it will be right to accept the family Cryptophialidae, v. Martens, side by side with the Lithoglyptidae of Aurivillius and the Alcippidae of Gerstaecker. These, with Darwin's three families above mentioned, complete the section of genuine cirripedes now existing. Gruvel submitted to the Linnaean Society a rearrangement of the Lepadidae, unfortunately using for the first of his new families the preoccupied name Anaspidae. It is confusing, but not uninstructive, to find that within the Balanid group such generic titles as *Stephanolepas* and *Platylepas* have been coined. The vernacular name barnacle, traceable to the fable of pedunculate cirripedes hatching out into bernicle geese, has also been transferred to the sessile cirripedes, which are popularly known as acorn barnacles. A complete list of all the recent species of Thyrostraca in both sections, down to the year 1897, was published by Weltner (*Arch. Naturg.*, 1898, § 63. pt. i. pp. 227–280). For fossil species, Woodward's *Catalogue of Brit. Foss. Crust.* (1877), pp. 137–144, should be consulted. Hoek

(" *Challenger* " *Reports*, " Cirripedia," 1883, viii. 8–11), gives a brief geological summary down to 1882. In that year J. M. Clarke (*Amer. Journ. Sci. and Arts*, 3rd series, vol. xxiv., p. 55) added a new species to *Plumulites* (Barrande, 1872), remarking that the species in question, *P. devonicus*, " is interesting in being the first representative of fossil barnacles from the Devonian, Barrande's species of *Plumulites* and *Anatifopsis*, as well as the *Turrilepis* of Woodward, being from the Upper and Lower Silurian, and *Plumulites jamesi* (Hall and Whitf., *Pal. Ohio*, vol. ii.) from the Hudson River group." Since *Plumulites* appears to be a synonym of *Turrilepas* (not *Turrilepis*), the species *Turrilepas wrightii* (Woodward, 1865), from the Upper Silurian of Dudley, did not long enjoy an isolated eminence as the oldest known cirripede. As pointed out by Dr Bather (*Geol. Mag.* 1901, decade 4, vol. viii. p. 521), palaeontologists themselves have in this branch not very closely followed the progress of their own science, since Dr Ruedemann, in regard to his new *Pollicipes siluricus*, 1901, speaks of " the enormous gap existing between the appearance of this Lower Siluric type and the next Upper Triassic (Rhaetic) representatives of the genera *Pollicipes* and *Scalpellum*." Many species of *Scalpellum* from the Wenlock shale of Gotland were described in 1892 by C. W. S. Aurivillius, who at the same time founded the species *Pollicipes signatus* on an almost perfect specimen from the Lower Ludlow of Wisby in Sweden. Aurivillius considered that *Pollicipes signatus* showed a closer approach to the Balanidae than any other of the Lepadidae, but he, too, in ignorance of the Devonian *Protobalanus* (Whitf.), discoursed needlessly about the gap in the distribution. Dr Bather justifiably anticipates further discoveries, but if, already in Silurian as in modern times, the members of these families had to pass through nauplius and cypris stages to maturity, there is one " enormous gap " between them and the common ancestor of the crustacean class that will not be easily filled. To later phylogenetic links an addition is offered by Dr Woodward (*Geol. Mag.*, 1901, p. 145), who transfers his *Pyrgoma cretaceum*, 1865, to a new genus *Brachylepas* (fig. 1), and a new family Brachylepadidae, intermediate between the Rhaetic *Pollicipes* and the modern *Balanus*. Among other fossil genera of recent institution, *Archaeolepas*, *Lepidocoleus*, *Squama*, *Stramentum* can only be mentioned as incentives to research. Among living forms, added since Weltner's catalogue, may be noticed *Koleolepas willeyi*, from the Loyalty Islands (Stebbing, in Willey's *Zool. Results* (1900) pt. v., p. 677. This was found in a Turbo shell, occupied also by a Pagurid, and coated with Actinians. The cirripede, which has an elastic peduncle, a crested capitulum, but no valves, and the first cirrhi longer than the rest, should stand near *Eremolepas*, the name given by Weltner in place of the preoccupied *Gymnolepas* (Aurivillius). In the genus *Scalpellum*, *S. giganteum*, Gruvel (*Trans. Linn. Soc.*, 1901) disputes with *S. stearnsii* (fig. 2), Pilsbury, 1890, which shall be accounted the greater. The latter is threatened with a new generic name (Chun, *Aus den Tiefen des Weltmeeres*, 1900, p. 502).

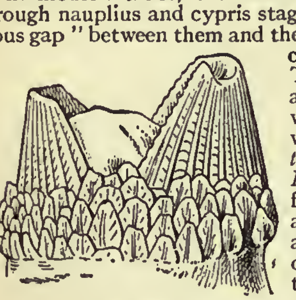

Fig. 1.—*Brachylepas cretacea* (Woodward), from Margate chalk.

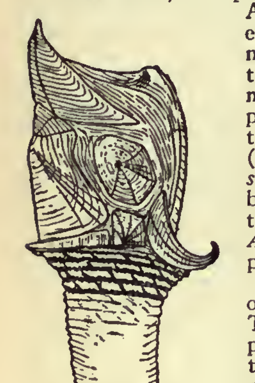

Fig. 2.—*Scalpellum stearnsii.* (Two-thirds nat. size.)

The horizontal distribution of barnacles over all seas is fully explained by Darwin. The bathymetric range of sessile as well as pedunculate forms down to such depths as twelve or eighteen thousand feet—*Verruca quadrangularis*, Hoek, 1900 fathoms; *Scalpellum regium*, Wyville Thomson, 2850 fathoms—is a more recent discovery. Gruvel (*Contribution à l'étude des Cirrhipèdes*, 1894) found that the species frequenting sea surface or shallow water, notwithstanding their feeble powers of vision, cannot live long when entirely debarred from light. It must, therefore, be supposed that abyssal forms have gradually acquired such tolerance of darkness as makes their health independent of the sun. Among other singularities of habitat, not the least curious is the freedom with which some small species, especially in the genus *Dichelaspis*, occupy the very jaws of large crustaceans. It is generally stated that cirripedes are confined to salt water, and, generally speaking, that is true. But *Platylepas bissexlobata* (De Blainville), from the west coast of Africa, is sometimes found entirely buried, except its operculum, in the skin of the manatee. Now, since it seems this *Manatus senegalensis* ascends rivers, we may infer that its parasite travels with it. Studer (*Crustacea of the Gazelle*, 1882) records *Balanus amphitrite* (Darwin?) from roots and stems of mangroves in the Congo, where, he says, " it follows the mangroves as far as their vegetation extends along the stream, to six sea-miles from the mouth." Darwin notes *B. improvisus* as quite tolerant of water not saline. Why the Thyrostraca, so hardy, so widely dispersed and multitudinous, and with a history so prolonged, should not have made more extended and more independent incursions into fresh water remains a problem. Though the *Ornitholepas australis* (Targioni Tozzetti, 1872), found on the tail feathers of a bird, represents only the cypris-larva of a cirripede, it still shows one of the many facilities for dispersion which these creatures enjoy. A striking instance of their abundance is cited by Aurivillius (1894) from a report by Captain G. C. Eckman, who late in the summer observed great masses of *Lepas fascicularis* forming broad belts in the North Sea. Aurivillius himself examined a humpback whale which had as many as fifty specimens of *Coronula diadema* on each side of its head. He believes that the cetacean approaches not only rocks, but ships, in the hope of freeing itself from its lodgers. Yet the fact that the long, soft *Conchoderma auritum* stands exposed on the *Coronula*, sometimes ten on one, indicates that the whale can have little chance of evicting its tenants, even at the expense of rubbing off the eighteen flattened horns of its own skin embedded in cavities round the domed base of the *Coronula* shell. The fecundity in the genus *Lepas* has struck many observers. Hoek (" *Challenger* " *Reports*, " Cirripedia," 1884, vol. x.) notes that, while in *Scalpellum* the number of eggs may be less than a hundred, " in *Lepas anatifera* it amounts, on the contrary, to many thousands and tens of thousands." In the same treatise Dr Hoek has useful chapters on the anatomy, development and sexes of the group, with references to the important researches since Darwin by Krohn, Claus, Kossmann and others. Francis Darwin, in the life of his father (1888, iii. 2), says, " Krohn stated that the structures described by my father as ovaries were in reality salivary glands, also that the oviduct runs down to the orifice described in the *Monograph of the Cirripedia* as the auditory meatus." Hoek, however, observes that the interpretation of the glands as salivary is not given by Krohn as his own opinion, but only quoted from Cuvier. Hoek himself proposes to call them pancreatic glands.

On the absorbing question of the development, T. T. Groom (*Phil. Trans.*, 1894, vol. clxxxv.) supplies a full bibliography, beginning with the pioneers Slabber (1778; properly 1769) and J. Vaughan Thomson (1830). Groom's monograph was almost immediately supplemented by Chun's chapters on the same subject (*Bibliotheca Zoologica*, 1895, Heft 19, Lieferung 2), to which an important discussion is contributed by H. J. Hansen (*Die Cirripedien der Plankton-Exp.*, 1899). He insists on the value of the upper lip or labrum for generic distinction, and as an aid in affiliating larval forms of different stages to their several species. He cites Groom's evidence that larvae obtained from the egg readily go through one moult in the aquarium, and the known fact that the last larval stage is marked by a longitudinal series of six pairs of immovable spines or processes. He considers, then, that by a judicious comparison of larval forms with these two easily determinable stages the poverty of existing information on the subject may be gradually, if laboriously, diminished. The large and peculiar *Archizoea gigas* of Dohrn must, he thinks, belong to the Lepadidae as a larva in the last stage, but not, as v. Willemoes Suhm supposed, to *Lepas australis*, or even to the genus *Lepas* at all.

Thyrostraca anomala.—This section comprises Darwin's Apoda, the footless, Lilljeborg's Suctoria, called by Fritz Müller the Rhizocephala or rootlet-headed, and the group to which Lacaze-Duthiers gave the alternative names Ascothoracida, sac-bodied or Rhizothoracida, rootlet-bodied. For the present these names may be dispensed with in favour of their equivalents, the three families Proteolepadidae, Sacculinidae and Lauridae. The first is still limited to the single genus and species *Proteolepas bivincta* (Darwin), parasitic within the sac of another cirripede. Nothing is certainly known of its development, except that the ova are extremely small, but H. J. Hansen (*Die Cirripedien der Plankton-Exp.*, 1899, p. 53) argues that various nauplii of a type not previously described may probably be referred to this group or family. The second family, discussed by Delage, Giard, Kossmann and others, has no dearth of genera and species, though about several of them the information is scanty. Almost all of them are parasitic on other crustaceans. *Sphaerothylacus polycarpus* (Sluiter, 1884) has an ascidian for its host. *Sarcotaces* (Olsson, 1872) has two species parasitic in fishes. But these exceptional and dubious forms do not obtain nutriment by sending rootlets in a rhizocephalous manner into their patrons. The family Peltogastridae is sometimes separated from the Sacculinidae, and sometimes made to do duty for both, the latter course being improper, since *Sacculina* (J. Vaughan Thompson, 1836) is not, as has been supposed, preoccupied, and must, therefore, take precedence of *Peltogaster* (Rathke, 1843). In the same family stands the genus *Sylon*, noted by Kröyer without a name in 1842, named by him without a description in 1855, described by Michael Sars in 1869, and published by G. O. Sars in 1870. Hoek (" *Challenger* " *Reports*, 1888, vol. xxiv. app. A) will orientate the English reader on this genus. For the complicated parasitism of isopods and Sacculinidae on the same hosts Giard and Bonnier (*Bopyriens*, 1887, p. 197) should be consulted.

The remaining family may, till further knowledge, be allowed to cover four remarkable species, three of them resident on Anthozoa, one on an echinoderm. Only the first, the celebrated *Laura* *gerardiae* (Lacaze-Duthiers, 1865), sends such rootlets into its host as would justify the term Rhizothoracida. The small sinuous segmented body is enclosed, except for one small opening, in an enormous sac-like carapace, between the lamellae of which are protruded from the body the ovary and "liver," both large, bifurcate and ramified. It is this sac-like and not valvular carapace, therefore, that justifies the term Ascothoracida. But *Synagoga mira*, Norman, 1888 (*Brit. Assoc. Report* for 1887), has the body covered by two nearly circular valves instead of a sac. *Petrarca bathyactidis*, G. H. Fowler (*Quart. Journ. Mic. Sci.*, 1889, vol. xxx. pt. ii. p. 115), has a bilobed carapace, ventrally open; *Dendrogaster astericola*, Knipovitch (*Biologisches Centralblatt*, 1891, x. 707), is a multilobular sac, with apparently indistinct segmentation of the body proper on the dorsal side. For this highly problematic group the original authorities should by all means be consulted. The student may then be asked to compare the account of *Synagoga mira* both with the figure of the cypris-stage of *Dendrogaster astericola* and with the figure of the "indeterminate animal found on Gerardia," about which Lacaze-Duthiers asks, "Is it the cypris-stage of Laura?" (*Mém. Acad. Sci.*, 1883, xlii. 160, pl. 1, fig. 102). *S. mira* was found, like *Laura gerardiae* (fig. 3), in the Mediterranean, and found like it attached

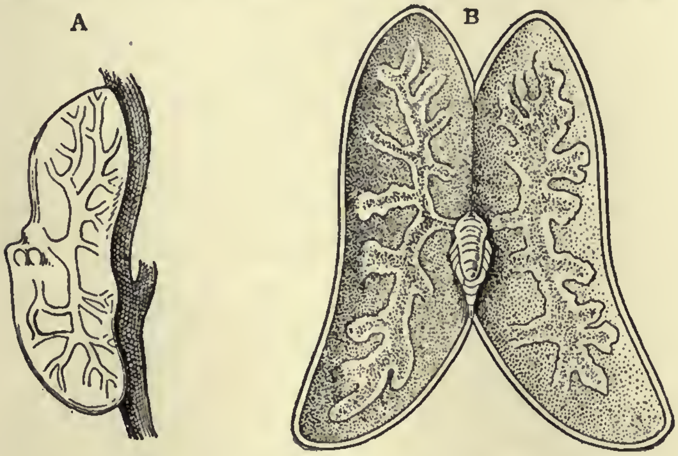

FIG. 3.—A, *Laura gerardiae*; B, Carapace slit open to show the body proper.

to an antipatharian. Its six pairs of limbs are not like the bare and simple feet of the *Laura*, but two-branched and setose as in the ordinary cypris-stage of the cirripede. The conclusion, therefore, from these facts and from the suggested comparisons, seems at least extremely probable that the question asked by H. Lacaze-Duthiers should be answered in the affirmative, and that *S. mira* is either the cypris-stage of *Laura gerardiae* or of some congeneric species. In Lacaze-Duthiers's highly-elaborated memoir it should be noticed that he uses the term "cirrhes" rather misleadingly, not for cirrhiform feet, but as the equivalent of setae. Also he gives two different reckonings of the segmentation, counting first eleven body segments without the caudal furca (p. 40), and then the caudal furca as itself the eleventh segment (p. 41). Of *Petrarca* the development is not yet known. The points of agreement and difference between it and *Laura* are carefully drawn out in the essay by Dr G. H. Fowler, who inclines to favour a close relationship between the Thyrostraca and Ostracoda. To the extreme development of the carapace in *Laura*, as compared with the segmented body, it would be difficult to find among crustaceans any analogy more striking than that of the great ovarial expansions in *Nicothoe astaci*, the little copepod parasite of the common lobster. The compactness of the class Crustacea is generally admitted; of the precise affinities of its subdivisions there is still much to learn.

(T. R. R. S.)

THYRSUS (the latinized form of Gr. θύρσος, a stem or stalk) the wand or staff of Dionysus (Bacchus), the Bacchants and Maenads and the votaries taking part in his orgiastic rites. As commonly represented on the monuments it was a straight staff terminating in a pine cone, a ribbon or fillet being attached to the head below it. Another form terminated in a bunch of grapes and vine leaves, or ivy-berries and leaves. The pine-cone or bunch of leaves was sometimes supposed to cover the head of a spear, and the thyrsus was termed θυρσόλογχος (see DIONYSUS and MYSTERY).

THYSANOPTERA (θύσανος, a fringe, and πτερόν, a wing), a term used in zoological classification for a small order of the class Hexapoda (*q.v.*). The minute insects included in it, which haunt blossoms and leaves, are fairly well known to gardeners by the name Thrips, a generic term used by Linnaeus for the four species of the group which he had examined and relegated to the order Hemiptera. The term Thysanoptera was first used by the Irish entomologist A. H. Haliday (1836), who made a careful study of the British species and recognized that their structural peculiarities required ordinal separation. H. Burmeister in 1838 also considered that these insects should form a distinct order, for which he proposed the name Physopoda, with reference to the bladder-like outgrowths (fig. 3) on the feet. Since then various authors have incorporated the Thysanoptera with one of the large orders, some, following Linnaeus, regarding them as Hemiptera, others grouping with them the Orthoptera or "Pseudoneuroptera." But all recent students agree with Haliday and Burmeister in allowing the Thysanoptera to rank as a distinct order, showing affinities on the one hand with the Corrodentia (book-lice and biting lice) and on the other with the Hemiptera (cicads, bugs, &c.).

(The illustrations in this article are all after H. Uzel, *Monographie der Ordnung Thysanoptera*, and are used with his permission.)

FIG. 1.—*Limothrips denticornis*, female, Europe. (× 20.)

Characters.—The Thysanoptera, small insects with firmly chitinized cuticle, are recognized by the combination of imperfectly suctorial jaws—the mandibles acting as piercers and maxillae retaining their palps (see fig. 2)—with the presence of two pairs of excessively narrow wings (fig. 1), which are partly or completely surrounded by elongate delicate bristles forming a fringe. Other important structural features are mentioned below. In their life-history the Thysanoptera belong to the Exopterygote division of the Hexapoda (*q.v.*). The newly hatched insect closely resembles the parent, and the wing-rudiments appear externally on the second and third thoracic segments; but before the final moult the nymph remains quiescent, taking no food. Its condition thus recalls the pupal instar of the higher (Endopterygote) Hexapoda; and the Thysanoptera, though few in number, are seen to be of great interest to the student, exhibiting at once a transition between the biting and the suctorial mouth, and the passage from "incomplete" to "complete" metamorphosis.

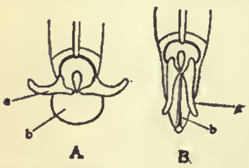
FIG. 2.—Head of *Aeolothrips fasciata*, face view, showing eyes, bases of feelers and jaws. (× 120.)

a, Clypeus.
b, Membrane between clypeus and labrum.
c, Labrum.
d, Mandible.
e, Unpaired piercer (? inner lobe of left maxilla).
f, Maxilla.
g, Its palp.
h, Second maxillae, forming labium.
i, Labial palp.

Structure.—The head is usually quadrangular in form with small but prominent compound eyes (fig. 2), whose facets are relatively large and convex; three ocelli may also be present on the vertex. The feelers are inserted close together (fig. 2) on the extreme front of the head; they exceed the head in length, but they are composed of only from six to nine segments, which are beset with prominent spines, some of the latter appearing to be organs of special sense. The mouth, with its jaws, forms a conical outgrowth which projects backwards, so that its apex lies beneath the prothorax. The labrum (fig. 2 *c*), which encloses the cone in front, is irregularly triangular in shape. Behind the mouth the two maxillae of the second pair are intimately associated to form the labium (fig. 2 *h*), whose appendicular nature is shown only by a median furrow and by short, cylindrical palps (fig. 2 *i*) with two or four segments. The maxillae of the first pair (fig. 2 *f*) enclose the mouth at either side. They are broad at the base, but taper towards the tip and carry palps (fig. 2 *g*) with two or three segments. Within the mouth lie a pair of slender piercers (fig. 2 *d*), while a single piercer (fig. 2 *e*) is situated asymmetrically on the left side. The nature of these structures has been much disputed. H. Uzel, with the majority of students, regards the paired organs as mandibles and the unpaired as an epipharynx. H. Garman and W. E. Hinds believe that the paired piercers are the inner lobes of the maxillae, and the unpaired piercer the left mandible, the right mandible being absent. C. Börner has stated that the unpaired piercer is attached directly to the base of the left maxilla. He therefore regards it as the inner lobe (*lacinia*) of that maxilla, comparing it with the remarkable "pick" of the maxilla of a book-louse (see Copeognatha in article NEUROPTERA). The paired piercers, connected by muscles with the base of the maxillae, but attached directly to the head skeleton, into which they can be withdrawn, are regarded by Börner as true mandibles.

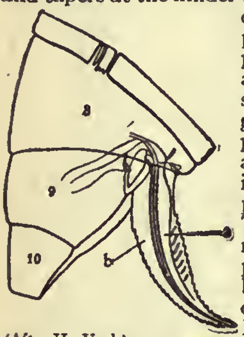
Turning to the thorax we find that the first segment (prothorax) is distinct and free, with a wide dorsal sclerite. The mesothorax and metathorax are rather intimately fused together. Most remarkable in this order is the structure of the feet; there are never more than two tarsal segments, and the claws, usually so conspicuous in insect feet, are reduced (fig. 3 *a*) or absent. But the legs carry peculiar spines, and the terminal tarsal segment is cup-shaped at the end; from this hollow a delicate bladder (fig. 3 *b*) can be protruded, apparently by the force of the blood-pressure, and by means of this bladder—acting as a sucker—the insect obtains firm hold on any surface which the foot touches. The narrow, delicate, fringed wings have already been described; each wing may be surrounded by a nervure and traversed by two longitudinal nervures, or the nervuration may be altogether degenerated. A fair number of species are wingless (fig. 5), either in one or both sexes, and the occurrence of winged females with wingless males is noteworthy.



(After H. Uzel.)

FIG. 3.—Foot of young *Trichothrips* (under surface). (× 300.)
A, With "bladder," *b*, protruded; B, retracted, *a*, Claws.

Ten segments are recognizable in the abdomen, which is elongated and tapers at the hinder end. In two of the three families of Thysanoptera the female has a conspicuous ovipositor (fig. 4) with serrate processes, projecting from the ventral surface of the abdomen between the eighth and ninth segments. The number of spiracles is greatly reduced; in the adult a pair is present on the mesothorax, sometimes also a pair on the metathorax, and there is always a pair on the first and another pair on the eighth abdominal segment. These spiracles, according to Hinds, are remarkable honeycomb-like structures, and perforations to the tracheal tubes have not been demonstrated. The internal structure of the Thysanoptera has been studied by K. Jordan. They possess a long, tubular gullet and a highly concentrated nervous system; in addition to the suboesophageal ganglion, there are two thoracic ganglia and a single abdominal nerve-mass which is situated far forward. In this condensation of the nervous system and in the presence of four Malpighian (excretory) tubes the Thysanoptera resemble the Hemiptera.



(After H. Uzel.)

FIG. 4.—Ovipositor (side view) of *Physopus*. (× 100.)
8, 9, 10, Abdominal segments.
a, Anterior; *b*, posterior process of ovipositor.

Development and Habits.—Many species of Thysanoptera are known to be habitually parthenogenetic. The eggs are laid on the food-plant, those females possessed of an ovipositor cutting through the epidermis and placing their eggs singly within the plant-tissues; a single female may take five or six weeks to deposit all her eggs. The young insect resembles its parent in most points, but the head is disproportionately large; the anterior abdominal spiracles are on the second segment instead of on the first, and the foot has only a single segment. At first the eyes consist of a few distinct facets on either side of the head; they increase in number as growth proceeds, and become aggregated to form the curious compound eye of the adult. From two to four moults occur, after which the "pronymph" stage is reached, which in the insect is moderately active and possesses wing-rudiments reaching to the second abdominal segment. After another moult the insect passes into the passive nymphal or "pupal" stage, during which it takes no food and rests in some safe hiding-place, such as the soil at the base of its food-plant or the hollow of a leaf-stalk. During this stage the cuticle draws away from the imaginal cuticle which is forming beneath, ultimately becoming separated as a thin transparent pellicle through which the form of the adult can be seen.

Thysanoptera are found on the leaves and in the blossoms of plants. According to Hinds they feed chiefly on the green tissues, which "are punctured by the piercing mouth-parts and the sap withdrawn by suction. The traces of their feeding are left in irregular streaks of dry, whitened cells." It has been stated that when present in blossoms they feed on nectar, but it is more probable that there—as on the green parts—they suck sap. In any case, their presence in apple blossoms has been known to prevent the formation of fruit through injury to the essential organs of the flower, and some species do considerable damage to ears of corn. Some Thysanoptera habitually dwell on the under-surface of leaves, and others periodically migrate to roots. While the majority of the Thysanoptera are thus vegetarian in their diet, and are frequently injurious in farm and garden, some species, at least occasionally, adopt a predaceous habit, killing aphids and small mites (so-called "red-spiders") and sucking their juices. There are even records of an *Anaphothrips*, when cut off from its normal vegetable food-supply, becoming cannibalistic and feeding on its own species. The usual variations in habit that characterize plant-feeding insects are exhibited by the Thysanoptera some species being found only on one particular food-plant, while others thrive indifferently on a large assortment. Some members of this order spend the winter in the adult state, others in the "larval" or "pupal" condition. They shelter in crevices of the bark of trees, in the dried stems of herbaceous plants, or among moss and fallen leaves on the ground. Hinds states that the hibernating individuals live for more than six months. During summer there may be eight or nine successive generations when conditions are favourable and food abundant.

Distribution and Fossil History.—The Thysanoptera are probably world-wide in their range, but they have hardly been studied outside Europe and North America. Fossil insects referable to the order have been found in Tertiary beds as old as the White River Oligocene of North America, and the Baltic amber, but nothing is known as to the previous history of the group.

Classification.—Only about 150 species of Thysanoptera are known; the European species with a few exotic forms have been described by Uzel, the North American by Hinds. These writers both follow the classification of Haliday, who divided the order into two groups or sub-orders.

1. *Terebrantia*: In this division (figs. 1, 4) the abdomen is cylindrical, the female is provided with a ventral ovipositor and has the terminal abdominal segment conical; the corresponding segment in the male is usually bluntly rounded. The forewings have at least a single longitudinal nervure—often two—reaching from base to tip of the wing. The maxillary palps have usually three, the labial either two or four segments. There are two families of Terebrantia: (*a*) the Aeolothripidae, whose feelers have nine segments; whose wings, relatively broad and rounded at the tip, have a few cross nervules, and whose ovipositor is curved backwards; and (*b*) the Thripidae, whose feelers have six to eight segments, whose narrow acuminate wings have no cross nervules, and whose ovipositor (fig. 4) is curved downwards. This latter family contains the great majority of the order.

2. *Tubulifera*: This division comprises but a single family — the Phloeothripidae; the species are not numerous, but some of them are of large size for Thysanoptera, as much as 8 mm. (one-third inch) in length. These insects have the abdomen flattened, with its terminal segment (see fig. 5) narrow and cylindrical. The palps, both maxillary and labial, have two segments. There is no ovipositor, and the wings are either without nervures or have only a single degraded longitudinal nervure which does not reach to the tip. While the Terebrantia are often rapid in their movements, the Tubulifera are slow and deliberate. According to Hinds, "they never run or spring."

(After H. Uzel.)

FIG. 5.—*Megalothrips lativentris*, female, Europe. (× 16.)

BIBLIOGRAPHY.—The number of important writings on the Thysanoptera is not large. A. H. Haliday's papers in *Entom. Mag.*, 1836–1837, vols. iii. and iv., are still valuable and contain nearly all that is known of the fifty British species. K. Jordan's anatomical studies (*Zeits. wiss. Zool.*, 1888, vol. xlvii.) are valuable and the descriptions of the jaws by H. Garman (*Amer. Nat.*, 1896, vol., xxx.) and C. Börner (*Zool. Anz.*, 1904, vol. xxvii.) should also be consulted. Indispensable to the student are H. Uzel's *Monographie der Ordnung Thysanoptera* (Königgratz, 1895; in the Czech language, but with a German summary), and W. E. Hinds's *Monograph* of the North American species (*Proc. U. S. Nat. Mus.*, 1903, vol. xxvi.). (G. H. C.)

THYSANURA, the name applied by P. A. Latreille to the primitive wingless insects known as springtails and bristletails. Sir J. Lubbock (Lord Avebury) separated the springtails as a distinct order, the Collembola, and by many students this separation has been maintained. It is better, on the whole, to regard the Thysanura and Collembola as sub-orders of a single order, the Aptera (*q.v.*). The Thysanura are recognizable by their elongate feelers and tail-processes (*cerci*). *Campodea* (*q.v.*) *Machilis* and *Lepisma*—to which belongs the "silver-fish" (*q.v.*)—are the best known genera. (See also HEXAPODA and APTERA.)

THYSSAGETAE, an ancient tribe described by Herodotus (iv. 22, 123) as occupying a district to the north-east of Scythia separated from the Budini by a desert seven days' journey broad—perhaps the Voguls. From their land four rivers flowed into the Maeotis, but as one of them, the Oarus, is almost certainly the Volga, there must be some mistake about this. They seem to have held the southern end of the Urals about Ufa and Orenburg. (E. H. M.)

TIAN-SHAN, or CELESTIAL MOUNTAINS, one of the most extensive mountain systems of Asia. In the widest acceptation, the system extends from the E. edge (in about 67° E.) of the Aral-Caspian depression in the W. to the great bend of the Hwang-ho (about 103° E.) in the E. The Chinese geographers, however, appear to have confined the term to that part of the system which falls between the conspicuous mountain-knot of Khan-tengri (80° 11′ E. and 42° 13′ N.) and the Otun-koza or Barkul depression in 92°-93° E., where the northern ranges of the system abut upon the Ek-tagh Altai; and this conception and limitation of the term are more or less accepted by some European geographers, *e.g.* Dr Max Friedrichsen and G. E. Grum-Grshimailo. On the other hand P. P. Semenov (or Semyonov), one of the earliest scientific explorers of the system, applies the name to the ranges which lie immediately west of Khan-tengri, including Khan-tengri itself. The Tarbagatai Mountains and their north-western continuation, the Chinghiz-tau, are sometimes considered to belong orographically to the Altai system; but there are good reasons for regarding them as an independent range. Excluding these mountains, the northernmost member of the Tian-shan system is the Dzungarian Ala-tau in 45°–45° 30′ N. The southernmost range is the Trans-Alai, or rather its W.S.W. prolongation, Peter the Great Mountains in Karateghin (Bokhara), though some geographers (*e.g.* Max Friedrichsen) assign both the Alai and the Trans-Alai Mountains to the Pamirs.

General Orographical Description.—The Tian-shan consists almost everywhere of "sheaves" of parallel ranges, having their strike predominantly east and west, with deflexions to the W.S.W., west of Khan-tengri and to the E.S.E., east of 92° E., thus describing as it were a wide flattened arc open to the south. The principal constituent ranges are accompanied by another set of ranges which break away from the main axes in a westerly or even in a north-westerly direction. In the east, where the system is narrowest, the predominant feature, at least as far west as 87° E., the longitude of the Bagrash-kul, is the Pe-shan swelling, with its flanking ranges, the Chol-tagh on the north and the Kuruk-tagh on the south. North of the Chol-tagh and west of Barkul and the depression of Otun-koza (alt. 2390 ft.) the principal constituent ranges are the Bogdo-ola, continued west and north-west in the Iren-khabirga, the Talki Mountains and the Boro-khoro, flanking in succession the great depression of Dzungaria on the south. South of this last line of elevations comes the depression of Kulja or Ili, cutting deep and far into the outer edge of the great plateau of central Asia. This again is bordered on the south by another series of ranges, the Narat Mountains and the Tömurlik-tau. The last bifurcates into the Trans-Ili Ala-tau and the Kunghei Ala-tau, skirting the north shore of Lake Issyk-kul. The west continuation of the Kunghei Ala-tau is the Alexander range, which in its turn bifurcates into the Talas-tau and the Kara-tau, this last stretching far out into the desert beside the Syr-darya. South of Lake Issyk-kul, which appears to be a hollow of tectonic origin, runs the Terskei Ala-tau, separating the lake from the high valley of the Naryn. On the south side of the Naryn valley comes the Kokshal-tau, called also in part the Boz-adyr, striking south-west from the Khan-tengri knot and terminating in the Terek-tau (40° 30′ N. and 74°–76° E.), at which point the system again bifurcates, the Ferghana Mountains running away from it towards the north-west until it, or rather its prolongation the Uzun-tau, strikes against the Talas-tau. From this latter point, again, the Chotkal-tau strikes away to the south-west, screening the valley of Ferghana against the Aralo-Caspian desert. The other arm of the bifurcation, situated farther south, and beginning at the Terek-tau, is double; it consists of the Alai and Trans-Alai ranges, continued westwards in the Karateghin, Zarafshan, Hissar and Turkestan ranges, though orographically the Trans-Alai ought probably to be described as the border-ridge of the Pamir plateau. Thus the Tian-shan is as a whole narrowest in the east and spreads out fan-like in the west.

Khan-tengri and the Central Tian-shan.—The peak of Khan-tengri, which according to Max Friedrichsen's observations is not so high as had generally been supposed, being 22,800 ft. instead of 24,000 ft., stands, not on the main watershed of the central Tian-shan, but on a spur which projects from the watershed towards the south-west. The loftiest summit on the actual watershed, according to G. Merzbacher, is a peak to which he has given the name of Nicholas Mikhailovich; its altitude he puts at 20,670 ft. But the general altitude of the crest of the watershed he estimates at about 16,500 ft., and it is overtopped by peaks (*e.g.* Dr von Almasy's peak Edward VII.) rising 3000–3500 ft. higher.

Closely connected with the Khan-tengri knot are the Khalyk-tau on the east, and on the west three diverging lines of elevation, namely the Terskei Ala-tau or Kirghiz Ala-tau, overhanging the south shore of Issyk-kul; the Kokshal-tau, stretching away south-west as far as the Terez Mountains between Kashgar and Ferghana; and, intermediate between these two, the successive ranges of the Sary-jas, Kulu-tau, and Ak-shiryak. The snowy chain of Khalyk-tau is highest in the north and west and sinks gradually towards the south and east. The highest parts of the range have generally an east-west strike and the range itself is continued east in the Kokteke (12,300 ft.), with the Kui-kuleh pass at an altitude of 11,500 ft.

From Issyk-kul there is a sharp rise of 6000–9000 ft. to the snow-capped ridge of the Terskei Ala-tau, the peaks of which ascend to 15,000–16,500 ft. and even reach 18,000 ft. At this part the system as a whole has a breadth of 150 m. The Terskei Ala-tau forms a sharply accentuated, continuous, snow-clad range. According to I. V. Mushketov it is continued westwards in the Son-kul (alt. 9,500 ft.) of Baron Kaulbars, the Kara-kol, and the Suzamir-tau, until it abuts upon the Talas-tau. The country immediately south of the Terskei Ala-tau consists "of broad, shallow basins running east and west in *en echelon* pattern, and lying at 10,000 ft. Between them and bordering them run from five to seven ridges as broad as the basins and rising by gentle slopes to 13,000–16,000 ft. The ridges rise by long, gentle slopes to flat summits, where often for many miles the sky-line is an almost straight crest, from which the rounded slopes of pure white snowfields descend towards the basins. The crest line is notched by high passes only 1000–2000 ft. below the top of the crest. Oftener the summit of the ridge is broken into individual mountains, broadly flat-topped and of nearly equal elevation. . . . (Since late Tertiary times) erosion has had but little effect in altering the country from the state to which it was brought by the uplifting and warping of the old peneplain. The result of these geological changes is that, although the internal structure of the Tian-shan region is highly mountainous, its external appearance, or in other words its geographical aspect, is that of a plateau."[1] The passes over the Terskei Ala-tau and the plateau country to the south lie at great altitudes—at 13,560 ft. in the Kulu-tau; at 13,800 in the Bedel pass, 12,400 in the Kubergenty, at 12,600 in the Terekty, and at 14,440 in the Jan-art pass—all in the Kokshal-tau; the Terek pass at 12,800 ft., and the Turugurt at 12,730 ft., both in the Terek range; the Barskoun at 12,000 ft., the Suka or Sauka at 11,650 ft., and the Jauku at 14,000 ft. in the Terskei Ala-tau; and the Tez at 11,800 and the Akbel at 12,000 ft., both in the Sary-jas; while the pass of Muz-art, on the east shoulder of the Khan-tengri, necessitates a climb of 12,000 ft. or more. The snow-line on the Terskei Ala-tau runs at 11,500 ft. The summits of the Kulu-tau or Kyulyu-tau reach 13,700 to 14,750 ft.; those of the Ak-skiryak 15,000–16,000 ft., overtopping by some 2000–3000 ft. the plateau or highland region which forms the water-parting between the Tarim basin on the east and the Syr-darya catchment area on the west. The Kokshal-tau, which consists of several parallel ranges, is truly alpine in character and bears large glaciers, which send out polyp-like arms into U-shaped valleys, behind which the mountain peaks tower up into sharp-cut, angular "matterhorns." The loftiest range is that to the north, which exceeds 16,000 ft., and the altitude increases generally from west to east as far as the Bedel pass in 78° 30′ E., where the road crosses from Ak-su and Uch-Turfan to the valley of the Naryn and Ferghana. At its south-western extremity the Kokshal-tau merges in the Kokiya Mountains (16,000–18,000 ft.), which at their other end are met by the Alai Mountains and the Terek-tau.

Eastern and Northern Tian-shan.—The mutual relations and exact orographical connexions of several of the ranges east and north of the Khan-tengri group are not yet elucidated. The region east of the Barkul-Hami route was in part explored in the closing years of the 19th century, by P. K. Kozlov, V. A. Obruchev, the brothers G. E. and M. E. Grshimailo, V. I. Roborovsky and Sven Hedin. The system is known there locally as the Barkul Mountains and the

[1] Ellsworth Huntington, in *Geog. Journ.* (1905), pp. 28 seq.

Karlyk-tagh,[1] which stretch from W.N.W. to E.S.E. Its middle parts are snow-clad, the snow lying down to 12,000 ft. on the north side, while the peaks reach altitudes of 14,000–15,000 ft., but so far as is known the range is not crossed by any pass except in the east, where there are passes at 9600 ft. and 10,600 ft. (Belu-daban). Towards the east, the Karlyk-tagh radiates outwards, at the same time decreasing in altitude, though it rises again in the rocky Emir-tagh. From the Karlyk-tagh a stony desert slopes south to the Chol-tagh. The Chol-tagh marks the northern escarpment, as the Kuruk-tagh, farther south, marks the southern escarpment, of the great Pe-shan swelling of the desert of Gobi. These two ranges (described under GOBI) are apparently eastern prolongations, the former of the Khaidyk-tagh or Khaidu-tagh, and the latter of the Kok-teke Mountains, which enclose on north and south respectively the Yulduz valley and the Lake of Bagrash-kul. Thus the Kuruk-tagh are linked, by the Kok-teke, on to the Khalyk-tau of the Khan-tengri group. The Khaidyk-tau, which are crossed by the passes of Tash-againyn (7610 ft.) and Kotyl (9900 ft.), are not improbably connected orographically with the Trans-Ili Ala-tau, or its twin parallel range, the Kunghei Ala-tau, in the west, in that they are an eastern prolongation of the latter. The Narat-tau appear to form a diagonal (E.N.E. to W.S.W.) link between the Khaidyk-tau and the Khalyk-tau and are crossed by passes which V. I. Roborovsky estimates at 10,800 ft. (Sary-tyur) and 11,800 ft. (Mukhurdai). The Jambi pass in this same range lies at an altitude of 11,415 ft. and the Dundeh-keldeh pass at 11,710 ft.

At the west end of the Barkul range is the gap of Otunkoza (2390 ft.), by which the Hami-Barkul caravan road crosses into the valley of Dzungaria, and at Urumchi (87°30′ E.), over 200 m. farther west, is a similar gap (2800 ft.) which facilitates communication between the oasis of Turfan and Dzungaria. Between these two gaps stretches the snow-clad range of the Bogdo-ola, which runs at an average altitude of some 13,000 ft., and rises to an altitude of 17,000–18,000 ft. in the conspicuous double peak of Turpanat-tagh or Topotar-aulie, a mountain which the Mongols regard with religious veneration. On the north side of this range the snow-line runs at an altitude of 9500 ft. At the foot of the same slopes lies the broad, deep valley of Dzungaria (2500–1000 ft.). On the south the Bogdo-ola is flanked by the nearly parallel range of the Jargöz, a range which, in contrast to most of the Tian-shan ranges, carries no perpetual snow. But its altitude does not exceed 10,000 ft., and its steep rocky slopes meet in a sharp, denticulated crest. West of the Urumchi gap, the Bogdo-ola is continued in the double range of the Iren-khabirga Mountains (11,500 ft.), which curve to the north-west and finally, under the name of the Talki Mountains, merge into the Boro-khoro range. The Iren-khabirga, like the Bogdo-ola and the Terskei Ala-tau, are capped with perpetual snow. They culminate in the peak of Dös-megen-ora at an altitude of 20,000 ft. The more southerly of the twin ranges, the Avral-tau, in which is the Arystan-daban pass at an altitude of 10,800 ft., terminates in 82° E., over against the confluence of the Kash and the Kunghez (Ili) rivers. The Boro-khoro Mountains, with an average elevation of at least 11,500 ft., have all the characteristics of a border-ridge. This range, the slopes of which are clothed with Coniferae between the altitudes of 6000 and 9000 ft., separates the valley of Kulja (Ili) on the south from the depressions of Zairam-nor (6820 ft.) and Ebi-nor (670 ft.) in the valley of the Borotala on the north, the said valley opening out eastwards into the wider valley of Dzungaria. The passes in the Boro-khoro lie at lower altitudes than is usual in the Tian-shan ranges, namely at 7000–7415 ft.

On its northern side the valley of Borotala is skirted by the important orographic system of the Dzungarian Ala-tau, the northernmost member of the Tian-shan. Its constituent ranges run from E.N.E. to W.S.W., though some of them have a W.N.W. and E.S.E. strike. The two principal series of parallel ranges possess no common names, but are made up as follows: The northern series (going from east to west) of the Baskan-tau, Sarkan-tau, Karazryk-tau, Bionyn-tau, and Koranyn-tau, running at an average elevation of 11,000–13,000 ft., and the southern series of the Urtak-saryk, Bejin-tau and Kok-su (Semenov's Labazy chain), at altitudes of 12,000–14,000 ft.

Western and Southern Tian-shan.—On the north side of the Issyk-kul, and separated from the Terskei Ala-tau by that lake, are the twin ranges of the Trans-Ili Ala-tau and Kunghei Ala-tau, parallel to one another and also to the lake and to the Terskei Ala-tau. The two chains are connected by the lofty transverse ridge of Almaty, Almata or Almatinka. The more northerly range, the Trans-Ili Ala-tau, swings away to the north-west, and is continued in the echeloned ranges of Kandyk-tau, Kulja-bashi, Khan-tau and the Chu-Ili Mountains, the general altitudes of which lie between 4000 ft. and 9000 ft. These latter ranges separate the Muyun-kum desert on the west from the Balkash deserts on the east. The Trans-Ili itself culminates in Mt Talgar at an altitude of 14,990 ft. The Kunghei Ala-tau rises nearly 8000 ft. above the Issyk-kul and lifts its summits higher than 13,000 ft. The passes across the twin ranges lie at 8000–11,000 ft. (Almaty pass) in the Trans-Ili Ala-tau and at 9000–10,885 ft. (Kurmenty pass) in the Kunghei Ala-tau. This last is continued without a break past the western end of Issyk-kul, being directly prolonged by the Alexander Mountains, although parted from them by the gorge of Buam or Bom, through which the Issyk-kul probably once drained. On neither of these ranges are there any true glaciers.

The Alexander Mountains terminate over against the town of Aulie-ata (71° 20′ E.) at the relatively low altitude of 2460 ft., though farther east they rise to 13,000–14,000 ft., and even reach 15,350 ft. in Mt Semenov. On the north their declivities are steep and rugged. They are crossed by passes at 6550–11,825 ft. (Shamsi).

From the middle of the Alexander range, in about 74° E., a chain known as the Talas-tau breaks away from its south flank in a W.S.W. direction, and from near the western extremity of this latter two parallel ranges, the Chotkal or Chatkal (14,000 ft.), and the Ala-tau, break away in a south-westerly direction, and running parallel to one another and to the river Naryn, or upper Syr-darya, terminate at right angles to the middle Syr-darya, after it has made its sweeping turn to the north-west. The Talas-tau, sometimes known as the Urtak-tau, while the name of Ala-tau is also extended to cover it, has an average elevation of 14,000–15,000 ft., but lifts its snow-capped summits to 15,750 ft.; it is crossed by passes at 8000–10,650 ft.

From near the west end of the Alexander range, in about 71° E., the Kara-tau stretches some 270 m. to the north-west, between the Syr-darya and the Chu. It belongs to the later series of transverse upheavals, and consists almost entirely of sedimentary rocks. It is not clear, however, whether orographically it is connected with the Alexander range or with the Talas-tau. Its average elevation is 5000 ft., but in places it reaches up to 7000–8000 ft. In the same north-westerly to south-easterly direction and belonging to the same series of later transverse upheavals are the Ferghana Mountains, which shut in the plain of Ferghana on the north-east, thus running athwart the radiating ranges of the central Tian-shan. The Ferghana Mountains, which are cleft by the Naryn (upper Syr-darya) river, have a mean altitude of 10,000 ft., but attain elevations of 12,740 ft. (Suyuk) and are crossed by the Terek pass (distinct from the Terek pass in the Terek Mountains) at an altitude of 9140 ft.

On the south the Ferghana valley is fenced in by the lofty range of the Alai, backed by the parallel range of the Trans-Alai. Both ranges abut at their eastern or E.N.E. extremity upon the Pamir plateau, and both extend in their respective continuations a long way out into the desert. The Alai is a well-defined ridge with steep slopes, and both it and the Terek-tau, which prolongs it towards the Kokshal-tau, are flanked next the Ferghana valley by what appear to be the old uplifted strata both of the old Palaeozoic series of metamorphic limestones and of the newer Tertiary series of softer conglomerates and sandstones. The general altitude of both ranges is 16,000–19,000 ft., but the Trans-Alai culminates in peak Kaufmann (23,000 ft.). The Trans-Alai is a true border range, the ascent to it from the Pamir plateau (13,000 ft.) on the south-east being gentle and relatively short, while both it and the Alai tower up steeply to a height of 11,000–14,000 ft. above the valley of the Alai. This valley, which runs up at its eastern end to the Muz-tagh-tau, is about 75 m. long and is continued towards the south-west by the valley of Karateghin. Its breadth varies from 3 to 12 m. and its altitude decreases from 10,500 ft. in the north-east to 8200 ft. in the south-west. It is drained by the Kyzyl-su, which, under the name of Vakhish, finally enters the Amu-darya. The Alai valley is in ill repute because of the enormous masses of snow which fall in it in the winter. Despite that it is an important highway of communication between Bokhara and the Pamirs on the one hand and Kashgar and Ferghana on the other. The principal passes over it into the valley of Ferghana are Taldyk, 11,605 ft.; Jiptyk, 13,605 ft.; Saryk-mogal, 14,110 ft.; Tenghiz-bai, 12,630 ft.; and Kara-kasyk, 14,305 ft. The first-named has been made practicable for artillery and wheeled carriages. The Pamir plateau is reached by means of the Kyzyl-art pass at an altitude of 14,015 ft.

The Alai Mountains are continued westwards in the radiating ranges of the Karateghin Mountains, Zarafshan Mountains, the Hissar Mountains and the Turkestan range, which reach altitudes of 18,500–22,000 ft., though peak Baba in the Zarafshan range reaches nearly 20,000 ft. The Trans-Alai are continued in the Peter the Great range, which culminates in the Sandal group at close upon 25,000 ft. (see further BOKHARA). The passes across these ranges are as a rule difficult and lie at altitudes of some 10,000–13,000 ft. The last outlying range of the Tian-shan system in this direction is the Nura-tau, which, like the Kara-tau farther north, belongs to the more recent series of upheavals having a W.N.W to E.S.E. axis. It rises abruptly from the desert and lifts its snowy peaks to altitudes of 15,000–16,000 ft., separating the river Syr-darya from the river Zarafshan. The passes over it lie at altitudes of 10,000–13,000 ft.

Glaciation.—In the central and western parts of the Tian-shan there exist numerous indications of former glaciation on an extensive scale, *e.g.* in the Sary-jas, the Terskei Ala-tau, Khan-tengri, Alai, Trans-Alai, Terek range, Trans-Ili Ala-tau, Kunghei Ala-tau, Kokshal-tau, Dzungarian Ala-tau, Alexander Mountains and Talas-tau.

[1] It may however eventually turn out that these ranges, together with the Mechin-ola, farther to the north-east and intimately connected with the Karlyk-tau, belong to the Altai system.

Indeed, the evidences, so far as they have been examined, appear to warrant the conclusion that the region of the western Tian-shan, from Lake Issyk-kul southwards, was in great part the scene of probably five successive glacial periods, each being less severe than the period which immediately preceded it. At the present day four or five large glaciers stream down the shoulders and embed themselves in the hollow flanks of Khan-tengri—the Semenov at altitudes of 12,410–11,100 ft., the Mushketov at 11,910–10,920 ft., the Inylchik at 11,320–10,890 ft., and the Kaindy at 10,810–10,040 ft. The Inylchik glacier is computed to have a length of about 45 m. Glaciers occur also on Manas mount to the south of the town of Aulie-ata. In the Alai region there are other extensive glaciers, *e.g.* the Fedchenko and Shurovsky glaciers south of peak Kauffmann. Generally speaking, the snow-line runs at 11,500–12,800 ft. above sea-level, and all ranges the peaks of which shoot up above 12,000 ft. are snow-clad, and all ranges which are snow-clad rise to higher altitudes than 11,500 ft. A feature generally characteristic of the Tian-shan as a whole is that the absolute elevation of the ranges increases gradually from north to south, and from the centre decreases towards both the east and the west. At the same time the relative altitudes, or the heights of the mountain ranges above the valleys which flank them, decrease from north to south. For instance, in the Dzungarian Ala-tau, the valleys going south lie successively at altitudes of 4300 ft. in the Borotala, at 5600 ft. in the Urtaksaryk and at 6820 beside the Zairam-nor. Again, while the Ili (Kulja) valley lies at 1300 ft., the Issyk-kul has an altitude of 5300 ft., the Koshkar basin, in which the river Chu has its source, reaches 6070 ft., the Son-kul valley 9430 ft., the Ak-sai valley, farther east, 10,000 to 11,150 ft., and the Chatyr-kul on the north side of the Terek Mountains 11,200 ft. In the elevated regions of this part of the system, between the Kokshal-tau and the Pamir plateau, the snow-line runs at a higher level than is usual elsewhere, namely at 12,500 ft. and even at 13,000–13,800 ft. on the Kokiya Mountains.

Climatic Conditions.—As a rule on all the Tian-shan ranges the ascent from the north is steep and from the south relatively gentle. But the deep lateral indentations (*e.g.* Kulja) provide a more or less easy access up to the loftier tablelands and plateaus of the interior. Broadly speaking, the climate on the north and west of the main ranges is both milder and moister than on the south and east, and accordingly the precipitation in the former is relatively heavier, namely 10 to 20 in. annually. It used to be supposed that the Tian-shan confronted the basin of the Tarim with a steep, wall-like versant. But this is not the case. G. Merzbacher, speaking of the slopes of the Khalyk-tau and other neighbouring ranges of the central Tian-shan, says that " nearly everywhere the Tian-shan slopes away gradually towards the high plain at its southern base, in places...subsiding gradually in ranges of transverse spurs, whose cape-like ends project far into the desert, or in other places in the step-like tailing off of longitudinal ranges.... In some places limestones appear as projections from the range; at others conglomerates and Tertiary clay marls form the outermost fold."[1] On the north versant of the ranges the rainfall increases from the foot of the mountains upwards, and at 9000–10,000 ft. the vegetation becomes luxuriant. According to P. P. Semenov, the following vegetable zones may be distinguished on the northern slopes: altitudes of 525–1575 ft. are steppe lands, of 1575–4300 ft. are the zone of cultivation, 4300–8100 ft. the zone of coniferous trees, 8100–9500 ft. alpine pastures, 9500–11,900 ft., the higher alpine regions, and above the last limit is the region of perpetual snow. The south versant, on the other hand, is barren and desolate below the 10,000 ft. limit and above that it is dotted with scanty patches of grass and bush vegetation. Its general aspect is that of rugged slopes of bare rock, seamed with the beds of dry torrents choked with gravel (see further TURKESTAN, WEST).

Routes.—The traditional routes between China on the one side and West Turkestan and Persia on the other have from time immemorial crossed the Tian-shan system at some half a dozen points. After traversing the desert of Gobi from Sa-chou to Hami, the great northern route crossed over into the Dzungarian valley either by the Otun-koza depression or by the gap at Urumchi, or else it proceeded over the Muz-art pass on the east side of Khan-tengri or over the Bedel pass in the Kokshal-tau and so down into the valley of Kulja. The shortest route, though not the easiest, between Kashgar and East Turkestan in the east and Ferghana and West Turkestan in the west is over the Terek pass or the pass at the head of the Alai valley, a dangerous route in winter by reason of the vast quantity of snow which usually accumulates there.

BIBLIOGRAPHY.—Dr Max Friedrichsen and Dr G. Merzbacher have both published good monographs on the central Tian-shan, the former " Morphologie des Tiën-schan," in *Zeitschrift der Gesellschaft für Erdkunde zu Berlin* (1899) and " Forschungsreise in den zentralen Tiën-schan," in *Mitteilungen der geog. Gesellschaft in Hamburg* (1904); and the latter in *The Central Tian-shan Mountains* (London, 1905). See also G. Brocherel's " In Asia Centrale," in *Bollettino della Società Geog. Italiana* (1904); P. P. Semenov (or Semyonov), in *Petermanns Mitteilungen* (Gotha, 1858) and in *Zeitschrift der Gesellschaft für Erdkunde zu Berlin* (1869); N. A. TIARA (Gr. τιάρα), also called *regnum*, *triregnum* and *corona*, the papal crown, a bee-hive shaped, somewhat bulging head-covering, ornamented with three crowns (whence *triregnum* or "triple crown"). It has no sacral character, being solely the ensign of sovereign power (cf. Innocent III. Serm. vii. *in S. Silvest*: " Pontifex romanus in signum imperii utitur regno "), and is therefore never worn at liturgical functions, when the pope always wears the mitre. The tiara is first mentioned, under the name of *camelaucum*, in the *Vita* of Pope Constantine (d. 715), and next under the name of *pileus phrygius* or *phrygium*, or the *Constitutum Constantini*, the so-called " Donation of Constantine." In the 9th century it appears in the 9th *Ordo* of Mabillon in connexion with the description of the consecration of the pope. On papal coins it first appears on those of Sergius III. (d. 911) and then on those of Benedict VII. (d. 983). At

Figure to illustrate the development of the Tiara.

this period it was, according to the *Ordo* above mentioned, a sort of cap of white stuff, and helmet-shaped. Before the 9th century the tiara was certainly without any crown; any such ornament would not have been in keeping with the circumstances of the time, and seems also to be excluded by the terms of the *Constitutum Constantini*. It is quite uncertain when the crown was first added. It is true that Mabillon's 9th *Ordo* calls this head-gear *regnum*, but it appears to know nothing of a crown. The papal coins and a few pictures of the 10th and 11th centuries leave it doubtful whether the ornamental band at the lower edge of the tiara is intended to represent a crown or merely a decorative orphrey (*aurifrisium*). At the beginning of the 12th century, however, the papal tiara was already decorated with a circlet, as the *Ordo* of Benedict (*c.* 1140) and statements made by Bruno of Segni and Suger, abbot of St Denys, prove; but it is only in representations of the tiara dating from the late 13th century that the circlet appears as a regular spiked crown. The two pendants at the back of the tiara (*caudae*, *infulae*) are likewise only traceable to this period. The second circlet was added by Boniface VIII., as is proved by three statues executed during his lifetime (one in the Lateran church and two in the crypt of St Peter's). Perhaps this was due only to the pope's love of display, but possibly the two crowns were intended to symbolize Boniface's views as to the twofold nature of the papal authority. In the inventory of the papal treasury made in 1316 the tiara is described as having three crowns; the third must therefore have been added under Benedict XI. or Clement V. The monumental effigy of Benedict XI. in S. Domenico at Perugia still has a tiara with one circlet in the antique fashion of the 13th century; that of John XXII. showed only two crowns. The earliest monumental effigy of a pope giving an example of a triple-crowned tiara is now, therefore, that of Benedict XII. (d. 1342), of which the head is preserved in the museum at Avignon, while an effigy of the same pope in the crypt of St Peter's at Rome has a tiara with only two crowns. Since Benedict XII. the triple-crowned tiara has appeared regularly on the monuments of the popes. The crowns are essentially uniform, though the ornament varies (leaves or spikes).

Outside Rome it was still a considerable time before the triple-crowned tiara appeared in representations of the popes, and as late as the 15th century they are sometimes pictured with the single-crowned tiara. The reason for the addition of the third crown is unknown. The symbolism now attached to the triple crown (authority over heaven, earth and hell, or the temporal power and the powers of binding and loosing) is certainly not the original explanation.

Several baseless hypotheses have been advanced as to the origin of the papal tiara. In all probability the *camelaucum*, the oldest form of the tiara, came into use under the Greek and Syrian popes of the 7th, or the beginning of the 8th century, perhaps even under Pope Constantine himself. The prototype of the *camelaucum* must undoubtedly be sought at Constantinople in the head-ornament forming part of the Byzantine court costume. (J. Bra.)

TIARET (*Tahert*), a town of Algeria, in the Tell Atlas, department of Oran, 122 m. S.E. of Mostaganem by rail. It occupies an important strategic position on a pass through the mountains at an elevation of 3552 ft. Pop. (1906), 5778, of whom 3433 were Europeans. The Wadi Tiaret flows through the town in a series of cascades. The upper town, the residential quarter, is on the right bank of this stream. The citadel occupies a separate hill on the other side of the wadi. The chief business centre is the lower town where are also the principal public buildings. On another hill opposite the citadel is the native town.

The citadel occupies the site of a Roman station believed to be that of Tingurtia. Tiaret (Berber for "station") was a town of note at the time of the Arab invasion of North Africa in the 7th century and is stated by Ibn Khaldun to have offered a stubborn resistance to Sidi-Okba. In 761 it was taken by Abdurrahman ibn Rostem, the founder of the dynasty of the Beni Rustām (Rostem). Their empire, which during the reign of Abdurrahman (761–784) and his son Abdul Wahab (784–823) extended over the greater part of the modern Algeria, was known as the Ibadite Empire from Abdallah ibn Ibad, the founder of the heretical sect to which Abdurrahman belonged. The Ibadites represented the moderate section of the Kharijites (see Mahommedan Religion). Seven princes of the Rustamite house succeeded Abdul Wahab at Tiaret, but in 909 the dynasty was overthrown by the Fatimite general al Shi'i. Two years later Tiaret was captured by Massala ibn Habbus of the Miknasa dynasty of Morocco, and after his death in 924 two other princes of the same house maintained their independence, but in 933 the Fatimites again gained the mastery. The Ibadites, after being expelled from the Tell, took refuge in Wargla. They were driven thence in the 11th century and migrated to Mzab, where their descendants still profess the Ibadite doctrines (see Mzabites). After its second capture by the Fatimites, Tiaret ceased to be the capital of a separate state. For a long period it was included in the sultanate of Tlemçen, and in the 16th century fell to the Turks. It was one of the chief towns of Abd el Kader, but was occupied by the French in 1843. At Takdempt, 6 m. west of Tiaret, Abd el Kader had his principal arsenal. About a mile from Takdempt are ruins of a town supposed to be the remains of the Ibadite capital. Eighteen miles S.S.W. of Tiaret are the sepulchral monuments known as the Jedars (see Algeria: § *Archaeology*).

TIBBU, or Tebu ("Men of Tu," *i.e.* "of the rocks"), a nomad negro-Berber race of the eastern Sahara, their territory being conterminous westward with that of the Tuareg Berbers. Roughly, their domain is some 200,000 sq. m. Their westernmost settlements are the oases of Agram, Kawar and Jebādo, their northernmost the district of Gatron (Qatrūn) within the Fezzan frontier, while south and south-east they merge gradually in the negroid populations of Kanem, Bornu (Chad basin), Wadai and north-west Darfur. But the bulk of the nation is concentrated in the region of Tibesti or Tu, hence their name. There are two main divisions—the northern Teda, or less negroid Tibbu, and the southern Daza, or more negroid Tibbu. Somewhat more distantly connected with the same family are the Baele of the eastern and south-eastern oases and the Zoghāwa (Zaghwa) of Darfur. The Tibbu are variously estimated as numbering from 60,000 to 100,000, but their districts are so little known that these figures are not to be relied on.

The Tibbu are usually identified with the Garamantes of Herodotus (iv. 183), whose capital was Garama (Idrisi's Germa) in Phazania (Fezzan), and of whom Ptolemy already spoke doubtfully as Ethiopians (Negroes ?): Ὄντων δὲ καὶ αὐτῶν ἤδη μᾶλλον Αἰθιόπων (i. 8). But Leo Africanus transfers them to the Berber connexion, whose fifth great division he deals with under the names of Gumeri (Garamantes?) and Bardaei or Bardoa, that is, the Teda of the Bardai oasis, Tibesti.[1] Lastly Heinrich Barth on linguistic grounds grouped them with the Kanuri of Bornu, who are undoubtedly negroes; and since his time (1852–1853) the Tibbu have been regarded by most ethnologists as a negroid people.[2] Gustav Nachtigal, who studied them carefully (1870–1873), although his own inferences are somewhat vague, supplies sufficient evidence for a solution of this difficult ethnological problem. There can be little doubt that the Teda, or true Tibbu, probably identical with the Tedamansii, a branch of the Garamantes, placed by Ptolemy south of the Samamycii in Tripolitana,[3] physically resemble their western Tuareg neighbours. They are a pure homogeneous race, who have for ages undergone no perceptible change in their rocky homes, and are still distinguished by the regular features, long black ringlety hair, haughty bearing and fierce expression common to so many of the Berber peoples. Mostly of middle size, they are finely proportioned, except the somewhat too small hands and feet, with lighter complexion than that of the southern Daza, and no trace of the flat nose, thick tumid lips, or other marked characteristics of the true negro. "Their women are charming while still in the bloom of youth" (Keane's *Reclus*, xxii. 429). But there has been a general displacement of the race southwards; and, while a few linger in the northern Gatron and Kufara districts, large numbers have since medieval times penetrated into the Kanem, Bornu, Wadai and Darfur regions of central Sudan. Here they have everywhere merged in the natives, so that in the Daza, Kanembu, Kanuri, Baele and Zoghāwa groups the Tibbu race presents all the shades of transition between the true negro and the true Berber.

The same transitional stages are observed in the Tibbu forms of speech, which constitute a wide-spread linguistic family, whose most archaic and purest branch is the Tedaga of Tibesti (Nachtigal). Through the southern Dazaga the Tedaga merges in the more highly developed and more recent Kanem, Bornu (Kanuri), Ennedi (Baele) and Darfur (Zoghāwa) dialects, which, owing to the absence of grammatical gender and some other structural features, are usually classed as negro languages. But a negro tongue could not have arisen among the people of Hamitic speech of the Tibesti uplands, and the explanation of this linguistic difficulty is obviously the same as that of the physical puzzle. The negro affinities of the southern members of the group have arisen through assimilation with the original and now partly displaced negro idioms of central Sudan. There remains the final difficulty that Tedaga itself has nothing in common with the Berber or any Hamitic tongue. If, therefore, it is neither Hamitic nor negro, the only two stock languages recognized by Lepsius in Africa, how is it to be placed? Lepsius's generalization, inconsistent as it is with the conditions occurring in other parts of the continent, must be rejected. Room having thus been found for other linguistic families, the Tedaga of Tibesti may be explained as an independent evolution from a primeval Tibbu-Berber germ, analogous to other linguistic evolutions in other isolated or inaccessible highland regions, such as the Caucasus, the Pyrenees and the Anahuac table-land. The common germ has long since perished, or can no longer be detected, and the Tibbu and Berber languages stand side by side as fundamentally distinct, while the two races remain physically one. The Tibbu are therefore a Berber people, who in their secluded homes have had time to evolve an independent form of speech, which southwards has become largely assimilated to the Sudanese negro dialects.

Lying on the tract of the great caravan route between Fezzan and Lake Chad, the Tibbu have always been a predatory race, levying blackmail on the convoys passing through their territory, maintaining inter-tribal feuds and carrying on constant

[3] The original inhabitants of the Kufara (Kufra) oases were Teda, some of whom survive in a settlement south of Jebel Nari. Since the beginning of the 18th century they have been replaced elsewhere in Kufara by the Zwiya Arabs from the Leshkerreh oases.

warfare with the surrounding Berber and Sudanese populations. The tribal organization embraces *dardai* or headmen, *maina* or nobles, and the common folk, while the unwritten law of custom rules supreme over all classes. Their customs are partly negroid, partly Arab. They scar their faces like the negroes and wear the veil like the Tuareg.

See G. F. Lyon, *Narrative of Travels in Northern Africa* (London, 1821); Gustav Nachtigal, *Sahara und Sudan* (Berlin and Leipzig, 1879–1889); Gerhard Rohlfs, *Quer durch Africa* (1874–1875).

TIBER (anc. *Tiberis*; Ital. *Tevere*), a river of central Italy. It traverses the Tuscan Apennines—in which it rises at a point some 12 m. N. of Pieve San Stefano, 4160 ft. above sea-level—in a series of picturesque ravines, skirts the west foot of the Sabine Mountains in a broad shallow valley, then crosses the Roman Campagna, cutting its way through Rome, and finally enters the Tyrrhenian (Mediterranean) Sea by two arms at Ostia and Fiumicino, the latter artificial. Its principal tributaries are the Paglia, the Nera and the Anio or Teverone, and it is generally navigable by boats up to the confluence of the Nera, a distance of 104 m., though, owing to the rapidity of the current, there is very little navigation above Rome. The total length of the river is 240 m., of which 21 m. lie between Rome and the sea. This latter portion of the river's course is tortuous, but in spite of this, and although the depth varies from only 7 to 20 ft., and in places at low water does not exceed 4 ft., it is nevertheless navigated by vessels up to 180 tons burden and proposals have been made to embank and dredge it so as to increase this depth to 8 ft. at least, or to build a ship canal up to Rome. The area of the Tiber basin is 6845 sq. m. The stream is heavily charged with sediment, and from that circumstance got its ancient epithet of *flavus* (tawny). It does not, however, form a delta proportionate to the volume of its water, owing to a strong sea current flowing northwards close to the shore, to the sudden sinking of the sea to a great depth immediately off the mouth of the river, and possibly also to the permanent subsidence of the Italian coast from the Tiber mouth southwards to Terracina. Still it has advanced at each mouth about 2 m. since Roman times, while the effect of the sediment it brings down is seen on the north-west almost as far as Palo (anc. *Alsium*), and on the south-east beyond Tor Paterno (see LAURENTINA VIA) in the gradual advance of the coast. The rate of advance at Fiumicino is estimated at 13 ft. per annum. From Rome to the sea the fall is only 6·5.: 1000. The arm which reaches the sea at Fiumicino is a canal, dug by Claudius and improved by Trajan (see PORTUS), which partially silted up in the middle ages, and was reopened for navigation by Paul V. in 1612, 2½ m. long, 80-130 ft. wide, and with a minimum depth of 5 ft. The lower course of the Tiber has been from the earliest ages subject to frequent and severe inundations; of more recent ones, those of 1598, 1870 and 1900 have been especially destructive, but since the year 1876 the municipality of Rome, assisted by the Italian Government, has taken steps to check, and possibly to prevent these calamities within the city by constructing embankments of stone, resting on caissons, for a total distance (counting in both sides of the river) of 6 miles. The flood of 1900 carried away about ¼ m. of the new embankment on the right bank of the right arm opposite the island owing to the faulty planning of the course of the river at that point, which threw the whole of the water into the right arm, and except in flood time, left the left arm dry—a fault which has since been corrected.

In the prehistoric period the mouth of the Tiber must have been situated at the point where the hills which follow it on each side cease, about 12 m. below Rome. On the right bank they are of pliocene gravel, on the left of tufa; and on the latter, on a cliff above the river (the ancient *Puilia saxa*) stood Ficana (marked by the farmhouse of Dragoncello), which is said to have owed its origin to Ancus Martius. Beyond these hills the low coast belt formed by the solid matter brought down by the river begins; and on each side of the mouth in the flat ground were salt marshes (see OSTIA, PORTUS). The flood of 1900, when the river both above and below Rome extended over the whole width of its valley, from hill to hill, and over most of the low ground at its mouth, gave an idea of the conditions which must have existed in prehistoric days.

TIBERIAS, a town on the western shore of the sea of Galilee (to which it gives its modern Arabic name, *Baḥr Tubariya, i.e.* Sea of Tiberias). It has a population of about 4000, more than half of whom are Jews (principally Polish immigrants). It stands in a fertile but fever-stricken strip of plain between the Galilee hills and the sea-shore. It is the seat of a ḳaimmaḳam or sub-governor, subordinate to the governor of 'Akka. There are Latin and Greek hospices here, as well as an important mission, with hospital and schools, under the United Free Church of Scotland. The pre-Herodian history of the city is not certain. There is a rabbinical tradition that it stands on the site of a city called Rakka, but this is wholly imaginary. Josephus (*Ant.* xviii. 2, 3) describes the building of Tiberias by Herod Antipas near a village called Emmaus, where are hot springs. This is probably the Hammath of Jos. xix. 35. The probability is that Herod built an entirely new city; in fact, the circumstance that it was necessary to disturb an ancient graveyard proves that there were here no buildings previously. The graveyard was probably the cemetery of Hammath. Owing to this necessity Herod had a difficulty in peopling his city, and, indeed, was compelled to use force (Jos. *Ant., loc. cit.*) to cause any but the dregs of the populace to incur defilement by living in a place thus unclean. On this account Tiberias was long regarded with aversion by Jews, but after the fall of Jerusalem it was settled by them and rose to be the chief centre of rabbinic learning.

The building of the city falls between A.D. 16 and A.D. 22. It was named in honour of the emperor Tiberius, and rapidly increased in luxury and art, on entirely Greek models. Probably because it was so completely exotic in character it is passed over in almost total silence in the Gospels—the city (as opposed to the lake) is mentioned but once, as the place from which came boats with sight-seers to the scene of the feeding the five thousand, John vi. 23. There is no reason to suppose that Christ ever visited it. The city surrendered to Vespasian, who restored it to Agrippa. It now became a famous rabbinic school. Here lived Rabbi Judah haḳ-Ḳadōsh, editor of the *Mishnah*; here was edited the Jerusalem Talmud, and here are the tombs of Rabbi Aqiba and Maimonides. Christianity never succeeded in establishing itself here in the Byzantine period, though there was a bishopric of Tiberias, and a church built by Constantine. In 637 the Arabs captured the town. The crusaders under Tancred retook it, but lost it to Saladin in 1187. In the 16th century the city was rebuilt by Joseph ben Ardut, subvented by Doña Gracia and Sultan Suleiman. An attempt was made to introduce the silk industry. In the 18th century it was fortified and occupied by the famous independent sheikh Dhahir el-Amir.

Tiberias is notoriously dirty and proverbial for its fleas, whose king is said by the Arabs to hold his court here. Most of the town was ruined by the earthquake of 1837. The most interesting buildings are the ruins of a fortress, perhaps Herodian, south of the town, and an ancient synagogue on the sea-coast. The hot springs mentioned by Josephus (and also by Pliny) are about half an hour's journey to the south. (R. A. S. M.)

TIBERIUS [TIBERIUS CLAUDIUS NERO] (42 B.C.–A.D. 37), Roman emperor, was born on the 16th of November, 42 B.C. His father, who bore the same name, was an officer of Julius Caesar, who afterwards proposed to confer honours on the assassins, then joined Mark Antony's brother in his mad attack on Octavian, took refuge with Mark Antony, and returned to Rome when the general amnesty was proclaimed in 39 B.C. Livia, the mother of Tiberius, was also of the Claudian family, out of which her father had passed by adoption into that of the Livii Drusi. Early in 38 Livia was amicably ceded to Octavian (the future Augustus), and three months after her new marriage Drusus, brother to Tiberius, was born. Livia had no children by Augustus, and therefore devoted all her remarkable gifts to the advancement of her sons. Tiberius passed through the list of state offices in the usual princely fashion, beginning with the quaestorship at the age of eighteen, and attaining the consulate for the first time at twenty-nine. From the great capacity for civil affairs which he displayed as emperor it may be inferred that he applied himself with determination to learn the business of government.

But from 22 to 6 B.C. and again from A.D. 4 to 10 by far the greater part of Tiberius's time was spent in the camp. His first service was as legionary tribune in one of the desperate and arduous wars which led to peace in the Spanish peninsula through the decimation, or rather the extermination, of the rebellious tribes. In 20 B.C. Augustus sent Tiberius with an army to seat Tigranes of Armenia on the throne as a Roman vassal. When Tiberius approached the frontier of Armenia, he found its throne vacant through the assassination of the king, and Tigranes stepped into his place without a blow being struck. Tiberius crowned Tigranes king with his own hand. Then the Parthian monarch grew alarmed, and surrendered " the spoils and the standards of three Roman armies." The senate ordered a thanksgiving such as was usually celebrated in honour of a great victory. The following year was passed by Tiberius as governor of Transalpine Gaul. In the next year (15) he was despatched to aid his brother Drusus in subjugating the Raeti and Vindelici, peoples dwelling in the mountainous region whence the Rhine, Rhone and Danube take their rise.[1] Drusus attacked from the eastern side, while Tiberius operated from the upper waters of the Rhine, and by stern measures the mountaineers were reduced to a state of quietude, and could no longer cut communications between northern Italy and Gaul, nor prosecute their raids in both countries. In 12 B.C. Agrippa, the great general of Augustus, died at the age of fifty-one, leaving Julia, the emperor's only child, a widow. Agrippina, daughter of Agrippa by an earlier marriage, was wife of Tiberius, and had borne him a son, Drusus, afterwards father of Germanicus. Livia, with great difficulty, prevailed upon Augustus to replace Agrippa by Tiberius, who was compelled to exchange Agrippina for Julia, to his bitter grief. During the year of mourning for Agrippa, which delayed his new marriage, Tiberius was occupied with a victorious campaign against the Pannonians, followed by successful expeditions in the three succeeding summers. For his victories in the Danube regions, the emperor conferred on him the distinctions which flowed from a military triumph in republican times (now first separated from the actual triumph), and he enjoyed the " ovation " or lesser form of triumphal entry into the capital. On the death of Drusus in the autumn of 9 B.C. Tiberius, whose reputation had hitherto been eclipsed by that of his brother, stepped into the position of the first soldier of the empire. The army, if it did not warmly admire Tiberius, entertained a loyal confidence in a leader who, as Velleius (the historian who served under him) tells us, always made the safety of his soldiers his first care. In the campaign of the year after Drusus's death Tiberius traversed all Germany between the Rhine and the Elbe, and met with slight opposition. But it would be too much to believe the statement of Velleius that " he reduced Germany almost to the position of a tributary province." He was rewarded with the full triumph, the military title of " imperator," and his second consulship, though the opposition of the powerful Sugambri had been only broken by an act of treachery, the guilt of which should perhaps be laid at the door of Augustus. In 7 B.C. there was another but insignificant campaign in Germany. Next year Augustus bestowed on his stepson the tribunician authority for five years. Tiberius was thus in the most formal manner associated with the emperor in the conduct of the government on the civil side; but Tacitus (*Ann.* iii. 56) goes too far when he says that this promotion marked him out as the heir to the throne.

Tiberius now suddenly begged permission to retire to Rhodes and devote himself to study. He seems to have declined absolutely at the time to state his reasons for this course, but he obstinately adhered to it, in spite of the tears of Livia and the lamentations of Augustus to the senate that his son had betrayed him. The departure from Italy was as secret as it could be made. Years afterwards, when Tiberius broke silence about his motives, he declared that he had retired in order to allow the young princes, Gaius and Lucius, sons of Agrippa and Julia, a free course. There was perhaps a portion of the truth wrapped up in this declaration. Like Agrippa, who retired to Mytilene to avoid the young Marcellus, Tiberius had clearly no taste to become the servant of the two children whom Augustus had adopted in their infancy and evidently destined to be joint emperors after his death. But it may well be believed that Tiberius, unlike Agrippa, had no burning ambition to see himself in the place destined for his stepsons; and it may have been in his eyes one of the attractions of exile that it released him from the obligation to aid in carrying out the far-reaching designs which Livia cherished for his sake. But the contemporaries of Tiberius were no doubt right in believing that the scandal of Julia's life did more than all else to render his position at Rome intolerable. His conduct to her from first to last gives a strong impression of his dignity and self-respect. When at length the emperor's eyes were opened, and he inflicted severe punishment upon his daughter, her husband, now divorced by the emperor's act, made earnest intercession for her, and did what he could to alleviate her suffering. At Rhodes Tiberius lived simply, passing his time mainly in the company of Greek professors, with whom he associated on pretty equal terms. He acquired considerable proficiency in the studies of the day, among which was astrology. But his attempts at composition, whether in prose or verse, were laboured and obscure. After five years' absence from Rome, he begged for leave to return; but the boon was angrily refused, and Livia with difficulty got her son made nominally a legate of Augustus, so as in some degree to veil his disgrace. The next two years were spent in solitude and gloom. Then, on the intercession of Gaius, Augustus allowed Tiberius to come back to Rome, but on the express understanding that he was to hold aloof from all public functions—an understanding which he thoroughly carried out.

He had scarcely returned before death removed (A.D. 2) Lucius, the younger of the two princes, and a year and a half later Gaius also died. The emperor was thus left with only one male descendant, Agrippa Postumus, youngest son of Julia, and still a boy. Four months after Gaius's death Augustus adopted Agrippa and at the same time Tiberius. The emperor now indicated clearly his expectation that Tiberius would be his principal successor. The two essential ingredients in the imperial authority—the *proconsulare imperium* and the *tribunicia potestas*—were conferred on Tiberius, and not on Agrippa, who was too young to receive them. Tiberius' career as a general now began anew. In two or three safe rather than brilliant campaigns he strengthened the Roman hold on Germany, and established the winter camps of the legions in the interior, away from the Rhine.

In A.D. 5 it became necessary to attack the formidable confederacy built up by Maroboduus, with its centre in Bohemia. At the most critical moment, when Pannonia and Dalmatia broke out into insurrection, and an unparalleled disaster seemed to be impending, Maroboduus accepted an honourable peace. The four serious campaigns which the war cost displayed Tiberius at his best as a general. When he was about to celebrate his well-won triumphs, the terrible catastrophe to Varus and his legions (A.D. 9) turned the rejoicing into lasting sorrow, and produced a profound change in the Roman policy towards Germany. Although Tiberius with his nephew and adopted son Germanicus made in A.D. 9 and 10 two more marches into the interior of Germany, the Romans never again attempted to bound their domain by the Elbe, but clung to the neighbourhood of the Rhine. Tiberius was thus robbed in great part of the fruit of his campaigns; but nothing can deprive him of the credit of being a chief founder of the imperial system in the lands of Europe. From the beginning of 11, when he celebrated a magnificent triumph, to the time of the emperor's death in 14 Tiberius remained almost entirely in Italy, and held rather the position of joint emperor than that of expectant heir. Agrippa Postumus had proved his incapacity beyond hope, and had been banished to a desolate island. In all probability Tiberius was not present when Augustus died, although Livia

[1] Horace, *Odes*, iv. 14.

spread reports (eagerly amplified by Velleius) of an affectionate interview and a lingering farewell.

Tiberius ascended the throne at the age of fifty-six. What struck his contemporaries most was his absolute impenetrability. All his feelings, desires, passions and ambitions were locked behind an impassable barrier, and had to be interpreted by the very uncertain light of his external acts. It is recorded of him that only once did he as commander take counsel with his officers concerning military operations, and that was when the destruction of Varus's legions had made it imperatively necessary not lightly to risk the loss of a single soldier. The penalty of his inscrutability was widespread dislike and suspicion. But behind his defences there lay an intellect of high power, cold, clear and penetrating all disguises. Few have ever possessed such mental vision, and he was probably never deceived either about the weaknesses of others or about his own. For the littleness and servility of public life in regions below the court he entertained a strong contempt. It is a question whether he ever liked or was liked by a single being; but he did his duty by those with whom he was connected after a thorough though stern and unlovable fashion. As a general he commanded the full confidence of his soldiers, though he was a severe disciplinarian; yet the men of his own legions greeted his accession to the throne with a mutiny. Tiberius proved himself capable in every department of the state more by virtue of industry and application than by genius. His mind moved so slowly and he was accustomed to deliberate so long that men sometimes made the mistake of deeming him a waverer. He was in reality one of the most tenacious of men. When he had once formed an aim he could wait patiently for years till the favourable moment enabled him to achieve it, and if compelled to yield ground he never failed to recover it in the end. The key to much of his character lies in the observation that he had in early life set before himself a certain ideal of what a Roman in high position ought to be, and to this ideal he rigidly adhered. He practised sternness, silence, simplicity of life and frugality as he deemed that they had been practised by the Fabricii, the Curii and the Fabii. That Tiberius's character was stained by vice before he became emperor, no one who fairly weighs the records can believe. The persuasion entertained by many at the end of his life that he had been always a monster of wickedness, but had succeeded in concealing the fact till he became emperor, has slightly discoloured the narratives we possess of his earlier years. The change which came over him in the last years of his life seems to have been due to a kind of constitutional clouding of the spirits, which made him what the elder Pliny calls him, "the gloomiest of mankind," and disposed him to brood over mysteries and superstitions. As this gloom deepened his will grew weaker, his power tended to fall into the hands of unworthy instruments, terrors closed in around his mind, and his naturally clear vision was perturbed.

The change of masters had been anticipated by the Roman world with apprehension, but it was smoothly accomplished. Tiberius was already invested with the necessary powers, and it may even be that the senate was not permitted the satisfaction of giving a formal sanction to his accession. Agrippa Postumus was put to death, but Livia may be reasonably regarded as the instigator of this crime. Livia indeed expected to share the imperial authority with her son. At first Tiberius allowed some recognition to the claim; but he soon shook himself free, and later became estranged from his mother and held no communication with her for years before her death. The history of Tiberius's relations with other members of his family is hardly less miserable. Perhaps with any other commander than Germanicus the dangerous mutiny of the troops on the Rhine which broke out soon after Tiberius's accession would have ended in a march of the discontented legions upon the capital. The perilous episode of Arminius caused the recall of Germanicus and his despatch to the East on an honourable but comparatively inactive mission. The pride and passion of Agrippina, the granddaughter of Augustus and wife of Germanicus, tended to open a breach between the husband and the emperor. In his Eastern command Germanicus found himself perpetually watched and even violently opposed by Piso, the governor of Syria, who was suspected to have received secret orders from Tiberius. When Germanicus died at Antioch in A.D. 19, the populace of Rome combined with Agrippina in demanding vengeance upon Piso; and the emperor was forced to disown him. The insinuation, conveyed by Tacitus, that Piso poisoned Germanicus on orders from Tiberius, will not stand criticism. The death of Germanicus was followed four years later by that of the emperor's son Drusus. These two princes had been firm friends, and Livilla, the wife of Drusus, was sister to Germanicus. Years afterwards it was found that Drusus had fallen a victim to the treachery of his wife Livilla, who had joined her ambition to that of the emperor's minister of State Sejanus. When Drusus died, Tiberius nominated two of Agrippina's sons as his heirs. But Sejanus had grown strong by nursing the emperor's suspicions and dislike for the household of Germanicus, and the mother and the princes were imprisoned on a charge of crime. In his memoirs of his own life Tiberius declared that he killed Sejanus because he had discovered that he entertained a mad rage against the sons of Germanicus. But the destruction of Sejanus did not save Agrippina and her two children. The third son Gaius Caesar (Caligula), lived to become emperor when Tiberius died in 37.

Throughout his reign Tiberius strove earnestly to do his duty to the empire at large; his guiding principle was to maintain with an almost superstitious reverence the constitutional forms which had been constructed by Augustus. Only two changes of moment were introduced. The imperial guard, hitherto only seen near the city in small detachments, was by the advice of Sejanus encamped permanently in full force close to the walls. By this measure the turbulence of the populace was kept in check. The officer in command of the guard became at once the most important of the emperor's lieutenants. The other change was the practically complete abolition of the old comitia. But the senate was treated with an almost hypocritical deference, and a pedantically precise compliance with the old republican forms was observed towards the senatorial magistrates. The care expended by Tiberius on the provinces was unremitting. His favourite maxim was that a good shepherd should shear the flock and not flay it. When he died he left the subject peoples of the empire in a condition of prosperity such as they had never known before and never knew again. Soldiers, governors and officials of all kinds were kept in wholesome dread of vengeance if they oppressed those beneath them or encouraged irregularity of any kind. Strict economy permitted light taxation and enabled the emperor to show generosity in periods of exceptional distress. Public security both in Italy and abroad was maintained by a strong hand, and commerce was stimulated by the improvement of communications. Jurisdiction both within and without the capital was on the whole exercised with steadiness and equity, and the laws of the empire were at many points improved. The social and moral reforms of Augustus were upheld and carried further. Such risings against the emperor's authority as occurred within the Roman domain were put down with no great difficulty. The foreign or rather the frontier policy was a policy of peace, and it was pursued with considerable success. With few exceptions the duties of the Roman forces on the borders were confined to watching the peoples on the other side while they destroyed each other. On the Rhine, at least, masterly inactivity achieved tranquillity which lasted for a long period.

The disrepute which attaches to the reign of Tiberius has come mainly from three or four sources—from the lamentable story of the imperial household, from the tales of hideous debauchery practised in deep retirement at Capreae during the last eleven years of the emperor's life, from the tyranny which Sejanus was permitted to wield in his master's name, and from the political prosecutions and executions which Tiberius encouraged, more by silent compliance than by open incitement. The stories of immorality are recorded chiefly by Suetonius, who has evidently used a poisoned source, possibly the memoirs of the younger Agrippina, the mother of Nero. Tiberius loved to shroud himself in mystery, and such stories are probably the result of unfriendly attempts to penetrate the darkness. If history ventures to doubt the blackness of Theodora, that of Tiberius grows continually lighter under the investigations of criticism. Suetonius makes the emperor's condition to have been one of mania, issuing frequently in the abandonment of all moral restraint. But in that case the authority of Tiberius, which was as firmly upheld during the years spent at Capreae as it had been earlier, must have fallen to pieces and come to an end. With respect to Sejanus, it is impossible to acquit Tiberius of blame. If he was deceived in his favourite he must have been willing to be deceived. He conferred on Sejanus a position as great as had been held by Agrippa during the reign of Augustus, and the minister was actually, and all but formally, joint emperor. Of the administrative ability of Sejanus there can be no question; but the charm and secret of his power lay in the use he made of those apprehensions of personal danger which seem never to have been absent from his master's mind. The growth of "delation," the darkest shadow that lies on the reign, was mainly a consequence of the supremacy and the arts of Sejanus. Historians of Rome in ancient times remembered Tiberius chiefly as the sovereign under whose rule prosecutions for treason on slight pretexts first became rife, and the hateful race of informers was first allowed to fatten on the gains of judicial murder. Augustus had allowed considerable licence of speech and writing against himself, and had made no attempt to set up a doctrine of constructive treason. But the history of the state trials of Tiberius's reign shows conclusively that the straining of the law proceeded in the first instance from the eager flattery of the senate, was in the earlier days checked and controlled to a great extent by the emperor, and was by him acquiesced in at the end of his reign, with a sort of contemptuous indifference, till he developed, under the influence of his fears, a readiness to shed blood.

The principal authorities for the reign of Tiberius are Tacitus and Suetonius. The *Annals* of Tacitus were not published till nearly eighty years after the death of Tiberius. He rarely quotes an authority by name. In all probability he drew most largely from other historians who had preceded him; to some extent he availed himself of oral tradition; and of archives and original records he made some, but comparatively little, use. In his history of Tiberius two influences were at work, in almost equal strength: on the one hand he strives continually after fairness; on the other the bias of a man steeped in senatorial traditions forbids him to attain it. No historian more frequently refutes himself. Suetonius was a biographer rather than an historian, and the ancient biographer was even less given to exhaustive inquiry than the ancient historian; moreover Suetonius was not gifted with great critical faculty, though he told the truth so far as he could see it. His *Lives of the Twelve Caesars* was written nearly at the time when Tacitus was composing the *Annals*, but was published a little later. Velleius Paterculus is by far the oldest authority for any part of Tiberius's life. He had been an officer under Tiberius, and he eulogizes his old general enthusiastically—feeling it necessary, however, to do less than justice to the achievements of Germanicus. To Velleius all defenders of Tiberius have eagerly appealed. In truth it is his silence alone which affords any external aid in repelling the charges of Tacitus and Suetonius, and the fact that Velleius published his work in the lifetime of his master deprives that silence of its value. The eulogy of Sejanus which is linked with that of Tiberius must needs shake faith in the scrupulousness of the author. It is still doubtful whether Dio Cassius (whose *History* ended with the year 229) in his narrative of the reign of Tiberius is to any great extent independent of Tacitus. In recent times a considerable mass of inscriptions has added to our knowledge of the administration of this emperor. The chief account of Tiberius in English is that contained in Dean Merivale's *History of the Romans under the Empire*. Professor E. S. Beesly has written an interesting defence of him in his *Catiline, Clodius and Tiberius* (1878). The best recent history of this period is Hermann Schiller's *Geschichte der römischen Kaiserzeit* (Gotha, 1883). Much historical information is given in the editions of the *Annals* of Tacitus, of which the best in English is that of Furneaux (Oxford, 1884); Freytag, *Tiberius and Tacitus* (Berlin, 1870) (following Stahr, *Tiberius*, Berlin, 1863), exposes the inconsistencies of Tacitus' account. Many monographs have since appeared, written on similar lines, among which may be mentioned Ihne, *Zur Ehrenrettung des Kaisers Tiberius* (Strassburg, 1892); Gentile, *L'Imperatore Tiberio secondo la moderna critica storica* (1887); J. C. Tarver, *Tiberius the Tyrant* (1902). The principles of the imperial administration of the provinces by Tiberius have been treated by Mommsen in the fifth volume of his *History of Rome*, translated into English by W. P. Dickson (1886).

(J. S. R.)

TIBESTI, a mountainous and little known region of the central Sahara, inhabited by the Tibbu (*q.v.*). The country was partly explored in 1870 by Gustav Nachtigal; it had not been again visited by Europeans up to 1910, though French officers had reached Borku on its southern borders. By the Anglo-French declaration of the 21st of March 1899 Tibesti was included in the French sphere of influence in North Africa.

TIBET, or THIBET, a country of central Asia. It is the highest country in the world, comprising table-lands averaging over 16,500 ft. above the sea, the valleys being at 12,000 to 17,400 ft., the peaks at 20,000 to 24,600 ft., and the passes at 16,000 to 19,000 ft. It is bounded on the N. by Turkestan, on the E. by China, on the W. by Kashmir and Ladak, and on the S. by India, Nepal and Bhutan. It has an area of over 1,000,000 sq. m., and an estimated population of about 3,000,000, being very sparsely inhabited.

Origin of Name.—The Tibetans call their country Bod, which

Emery Walker sc.

word in colloquial pronunciation is aspirated into *Bhöd* or *Bhöt*, and in the modern Lhasa dialect is curtailed into *Bhö*. Hence the country is known to Indians as *Bhōt*, and the inhabitants as *Bhōt-ias*. This territory came to be known to Europeans as "Tibet" evidently because the great plateau with its uplands bordering the frontiers of China, Mongolia and Kashmir, through which travellers communicated with this country, is called by the natives *Tö-bhöt* (written *stod-bod*) or "High *Bod*," or "Tibet," which designation in the loose orthography of travellers assumed a variety of forms. Thus in Chinese annals are found *T'u-bat* (5th century, A.D.), *Tu-po-te, Tie-bu-te, T'u-bo-te* (10th and 11th centuries) and at the present day *T'u-fan* (*fan*, as Bushell shows, being the same Chinese character which had formerly the sound of *po*); in Mongolian, *Tübet, Toböt*; in Arabic, *Tubbet*; Istakhri (*c.* 590), *Tobbat*; Rabbi Benjamin (1165), *Thibet*; J. de Plano Carpini (1247), *Thabet*; Rubruquis (1253), Marco Polo (1298), *Tebet*; Ibn Batuta (1340), *Thabat*; Ibn Haukal (976), Al Biruni (1020), Odoric of Pordenone (*c.* 1328), Orazio della Penna (1730), *Tibet*, which is the form now generally adopted. The inhabitants of Tibet call themselves *Bod-pa* (pronounced usually *Bhö-pa*), or "people of Bod." Other Tibetan epithets for the country sometimes used by flowery native writers are "The Icy Land" (*Gangs-c'an*) and the "Country of the Red Faces" (*Gdong-mar-gyi yul*). The Chinese name for central Tibet is *Wei-Ts'ang*, which is a transcription of the Tibetan designation of the two provinces Ü and Tsang (spelt *dbus-gtsang*) that constitute central Tibet. Among the Mongols, Tibetans are called *Tangutu* and the country *Barontala* or the "right side," in contradistinction to *Dzöntala* or "left side," which was their own name for Mongolia itself.

Geography.—Physically Tibet may be divided into two parts, the *lake region* in the west and north-west, and the *river region*, which spreads out on three sides of the former on the east, south, and west. The lake region extends from the Pangong t'so (t'so = lake) in Ladak, near the source of the Indus, to the sources of the Salween, the Mekong and the Yangtse. This region is called the Chang-t'ang (*Byang tang*) or "Northern Plateau" by the people of Tibet. It is some 700 m. broad, and covers an area about equal to that of France. From its great distance from the ocean it is extremely arid, and possesses no river outlet. The mountain ranges are spread out, rounded, disconnected, separated by flat valleys relatively of little depth. The country is dotted over with large and small lakes, generally salt or alkaline, and intersected by streams, and the soil is boggy and covered with tussocks of grass, thus resembling the Siberian tundra and the Pamirs. Its average altitude is over 16,000 ft., the northern portion of it being the highest. Salt and fresh-water lakes are intermingled. The lakes are generally without outlet, or have only a small effluent. The deposits consist of soda, potash, borax and common salt. This last is frequently found piled high and split into blocks apparently of artificial formation, but probably the result of the action of wind and intense cold. The loftiest lake so far as observed is Hospa t'so, near the Lingshi plain on the Kashmir frontier; its altitude is given as 17,930 ft. The lake region is noted for a vast number of hot springs, which are widely distributed between the Himalayas and 34° N., but are most numerous to the west of Tengri Nor (north-west of Lhasa). So intense is the cold in Tibet that these springs are sometimes represented by columns of ice, the nearly boiling water having frozen in the act of ejection. The southern portion, from Lake Pangong to Tengri Nor, is inhabited by pastoral tribes of Tibetans, and possesses a few hamlets, such as Ombo, Rudok and Senja jong. The river region comprises the upper courses of the Brahmaputra (Yaru Tsangpo), the Salween (? Gyama nyul chu), the Yangtsze (Dre chu), the Mekong (Nya-lung chu), and the Yellow River (Ma chu). Amidst the mountains there are many narrow valleys, partially cultivated from an altitude of 12,000 ft. downwards, with here and there fine forests covering the mountain sides. Villages of high stone-built houses are to be found wherever the valley bottoms open out enough to afford a little space for agriculture. The northern portion of Tibet is an arid and wind-swept desert; but in the southern portion the valleys of Lhasa, Shigatse, Gyantse and the Brahmaputra are covered with good soil and groves of trees, well irrigated, and richly cultivated.

The valley of the Brahmaputra (*q.v.*), or Yaru Tsang-po or simply Tsang-po—the river has also various local names—is the great arterial valley of southern Tibet. On the south it is bounded by the Himalayas, on the north by a mountain-system still more vast. This mountain-system was only vaguely known, in fact its existence throughout its length was only suspected, until Sven Hedin, during his journeys in 1906–1908, crossed it at several points. He found the system to form the chief physiographical feature of southern Tibet, and stated it to be "on the whole the most massive range on the crust of the earth, its average height above the sea-level being greater than that of the Himalayas. Its peaks are 4000 to 5000 feet lower than Mount Everest, but its passes average 3000 feet higher than the Himalayan passes." Its extreme breadth is about 120 m. in the central part, its northern limit being marked by the chain of lakes running N.W. and S.E. between 30° and 33° N., beyond which the mountains of central Tibet are much lower. The system at no point narrows to a single range; generally there are three or four across its breadth. As a whole the system forms the watershed between rivers flowing to the Indian Ocean—the Indus and its tributaries, Brahmaputra and its tributaries, and Salween—and the streams flowing into the undrained salt lakes to the north. The principal ranges in the system are the Nien-chen-tang-la, called Kanchung-gangri in the west, the Targo-Gangri-Lapchung range, the very lofty Hlunpo-Gangri range, the Dingla range, &c. The whole system had been marked by inference on some maps before Hedin's discoveries, and named Gangri; Hedin proposed for it the name of Trans-Himalaya.

Geology and Mineral Wealth.—Little is known of the geological structure of the central regions of Tibet. The observations of Strachey, Godwin-Austen and of Griesbach and other members of the Geological Survey of India only extend to the southern edge or rim of the great plateau, where vast alluvial deposits in horizontal strata have been furrowed into deep ravines, while Russian explorers have but superficially examined the mountain regions of the north and north-east, and the British mission to Lhasa in 1904 afforded observations merely along the trade-route to that city.

The general structure of the trans-Himalayan chains appears to indicate that the main axis of upheaval of the whole vast mass of the Tibetan highlands is to be found on two approximately parallel lines, represented the one by the Kuen-lun and the other by a line which is more or less coincident with the watershed between India and the central lake region, extending from Lake Pangong to Tengri Nor, the plateau enclosed between the two being wrinkled by minor folds, of which the relative elevation is comparatively low, averaging from 1000 to 1500 ft. The strike of these folds is usually east and west and roughly parallel to the axes of elevation of the plateau. A remarkable economic feature is the almost universal distribution of gold throughout Tibet. The gold-digging is referred to in somewhat mythical terms by Herodotus. Every river which rises in Tibet washes down sands impregnated with gold, and it has been proved that this gold is not the product of intervening strata, but must have existed primarily in the crystalline rocks of the main axes of upheaval. In western Tibet the gold mines of Jalung have been worked since 1875. They have been visited by native explorers of the Indian Survey, who reported that much gold was produced and remitted twice a year under a Chinese guard to Peking. The Tibetan diggers collected together at the mines chiefly during the winter, when the frost assisted to bind the loose alluvial soil and render excavation easy. These mines are within 200 m. of the Ladak frontier, near the sources of the Indus, at an elevation which cannot be less than 15,000 ft. above sea-level. They are worked in crude desultory fashion and are sometimes abandoned owing to the exorbitant imposts levied on gold production by Chinese and Tibetan officials. Between the Ladak frontier and Lhasa the plateau region teems with evidences of abandoned mines. These mines are excavations in the alluvial soil, never more than from 20 to 30 ft. deep.

The researches of Prjevalsky demonstrate that gold is plentiful in northern and eastern Tibet. Here Tungus diggers were encountered who had extracted handfuls of gold in small nuggets from a stream bed at a depth which they stated to be no greater than 2 ft. Another scientific explorer, W. Mesny, has observed similar evidences of the existence of gold at comparatively shallow depths in Koko Nor region, and records that he has seen nuggets, "varying from the size of a pea to that of a hazel-nut," in eastern Tibet. The gold was almost pure and perfectly malleable. The Gork goldfields, which are visible from Koko Nor, are reported to have yielded to China considerable quantities of gold as lately as 1888. They are now deserted. Prjevalsky, indeed, predicts of northern Tibet that it will prove a "second California" in course of time. But little gold at present finds its way across the Tibetan passes to India; and the export to China has diminished of late years.

Iron is found in eastern Tibet in the form of pyrites, and is rudely smelted locally. Salt and borax exist in abundance in the western lake regions. The exportation of borax to India is only limited by the comparatively small demand. Lapis-lazuli and mercury are among the minor mineral products of the country.

Climate.—The climate of Tibet varies so greatly over the enormous area and different altitudes of the country that no two travellers agree precisely in their records. Tibet is affected by the south-west monsoon, just as the Pamirs are affected, but in varying degrees according to geographical position. In western Tibet, bordering the Kashmir frontier, the climate differs little from that of Ladak. Intense dryness pervades the atmosphere during nine months of the year; but little snow falls, and the western passes are so little subject to intermittent falls of fresh snow as frequently to be traversable during the whole year round (see LADAKH). Low temperatures are prevalent throughout these western regions, whose bleak desolation is unrelieved by the existence of trees or vegetation of any size, and where the wind sweeps unchecked across vast expanses of arid plain. All the western region is but slightly affected by the monsoon. The central lake region, extending from the Kuen-lun to the Himalaya, is also characterized by extreme dryness in autumn, winter and spring, with an abundance of rain in summer, whilst the eastern mountain region, extending to China south of the Dang la (which, with an altitude of about 20,000 ft., stretches from 90° to 97° E. along the parallel of 33° N., and arrests the monsoon currents), is subject to much the same climatic influences as the eastern Himalaya. The southern slopes of the Dang la are deluged with rain, hail and snow throughout the year. Northern Tibet is an arid waste, subject to intense heat in summer and intense cold in winter. In March snow still lies deep in the Tsaidam passes, while Wellby found the heat oppressive in June at 16,000 ft. elevation on the plateau south of the Kuen-lun, and a temperate climate prevailing about the sources of the Dre chu (Yangtsze) in August.

All travellers testify to the perpetual wind currents from the west, which sweep across the salt bogs of Tsaidam (9500 ft.) and through the higher valleys of eastern Tibet. Wind is a prevailing feature throughout Tibet at certain seasons of the year, as it is in the Pamirs, in Turkestan, in western Afghanistan and in Persia. The climate of southern Tibet is, however, subject to considerable modifications from that of the northern and central regions, owing doubtless to its geographical connexion with northern India. Here, at an elevation of 15,000 ft., about the great Lake Dangra, we hear of well-built villages and of richly cultivated fields of barley, indicating a condition of climate analogous to that which prevails in the districts south of Lhasa, and in contrast to the sterility of the lake region generally and the nomadic character of its population. Modern travellers bear witness to a gradual progress of desiccation in the Tibetan uplands. Everywhere there are signs of the diminution of the lakes and the recession of the water line—a phenomenon that has also been observed in the Pamirs. There are still enormous glaciers about the head of the Brahmaputra, but the glacial epoch of the Chang-t'ang highlands has passed away, though comparatively recently.

Flora.—Our knowledge of the flora of northern and central Tibet has been considerably increased by the collections of Prjevalsky, Wellby, Bower, Thorold, Littledale and the Lhasa Mission, and that of eastern Tibet by Rockhill. The former and other collections have been described in W. B. Hemsley's *The Flora of Tibet or High Asia.* Western and southern Tibetan flora were partially explored previously to the advent of these travellers. Professor Maximowicz concludes from an analysis of the Prjevalsky collection that the flora of Tibet is extremely ancient, and that it is chiefly composed of immigrants from the Himalaya and Mongolia. There is also a large percentage of endemic species. Chinese and European plants followed in the process of immigration. Those species which are distinctive of the eastern border ridges are found to reach the plateau, but do not spread westwards, so that a botanic separation or distinction is found to exist between the true plateau of Tibet in the west and the alpine tracts of the east. Thiselton-Dyer classes the flora of Tibet on the whole as belonging to the Arctic-Alpine section of the great northern division, but containing a purely endemic element. Two typical species are *Lychnis apetala,* which extends to Spitsbergen, and the well-known edelweiss. A single fern specimen obtained by Littledale (*Polypodium hastatum*) is indicative of eastern China. Of the forty or fifty genera obtained by Littledale in central Tibet a large proportion are British, including many of the most characteristic mountain forms. In the higher regions of northern and western Tibet the conditions under which vegetation exists are extreme. Here there are no trees, no shrubs, nor any plants above a foot high. Wellby says he saw nothing higher than an onion. The peculiar form of tussocky grass which prevails in the Pamirs is the characteristic feature of the Tibetan Chang-t'ang of the Tsaidam plains and of the bogs north-east of Lhasa. Of grasses indeed there are many forms, some peculiar to Tibet, but no trees or shrubs at any elevation higher than 15,000 ft., except in the Kharo Pass of central Tibet, where Waddell has recorded trees (? *Hippophae* sp.) about 20 ft. high at an elevation of 16,300 ft. A flowering plant (*Saussurea tridactyla*) was discovered by Bower at an elevation of 19,000 ft. In south-eastern Tibet, where Himalayan conditions of climate prevail, we have a completely different class of flora. Of the flora of Tibet Rockhill writes: "In the 'hot lands' (*Tsa-rong*) in southern and south-eastern Tibet, extending even to Batang, peaches, apricots, apples, plums, grapes, water-melons, &c., and even pomegranates, are raised; most of Tibet only produces a few varieties of vegetables, such as potatoes, turnips, beans, cabbages, onions, &c. The principal cereals raised are barley and buckwheat, wheat in small quantities, and a little oats. A few localities in the extreme southern portions of the country, and around Lhasa possibly, are said to produce a non-glutinous variety of rice. A variety of mountain bamboo is found in southern and parts of eastern Tibet, and is much used for basket work. Tibet produces a large number of medicinal plants much prized by the medical profession in China and Mongolia, among others the *Cordyceps sinensis,* the *Coptis teeta,* Wall., and *Pickorhiza kuwoa,* Royle, &c. Rhubarb is also found in great quantities in eastern Tibet and Amdo; it is largely exported for European use, but does not appear to be used medicinally in the country. The trees most commonly found are the plane, poplar, maple, walnut, oak, the *Cupressus funebris,* and various varieties of the genera *Pinus, Abies* and *Larix.* Some valuable plants are obtained in the mountains of south and south-western Tibet, yielding the excellent yellow and red colours used to dye the native cloths." Waddell gives a list of 164 species of plants collected by him at Lhasa, several being new species.

Fauna.—The fauna of Tibet has been by no means exhaustively investigated, especially the rodents and smaller species of animals. Among domesticated animals are to be found the horse, mule, donkey, cattle, sheep and goats, dogs, fowls and pigs, ducks and geese. Probably no country in the world, excepting perhaps inner Africa, so abounds in wild animals as the cold solitudes of the northern plateau. Here are to be found yak, wild asses (*kyang*), several varieties of deer, musk deer and Tibetan antelope (*Pantholops*); also wild sheep (the *bharal* of the Himalaya), *Ovis hodgsoni* and possibly *Ovis poli,* together with wild goats, bears (in large numbers in the north-eastern districts), leopards, otter, wolves, wild cats, foxes, marmots, squirrels, monkeys and wild dogs. To this list must be added the curious sloth-bear *Aeluropus melanoleucus,* a rare eastern species, and the so-called "unicorn" antelopes, the "tākyin" (*Budorcas taxicolor*), also an eastern Indo-Malayan species. Birds are fairly numerous, and include many varieties of water-fowl, several of which (*Anser indicus,* the bar-headed goose, for instance) breed in Tibet, while others are only found as birds of passage. In eastern Tibet, on the Chinese border, varieties of the pheasant tribe abound, some of which are rare. Among them are the "white" pheasant, the *Ceriornis temminckii,* two kinds of eared pheasant and Anderson's pheasant. The Tibetan sand-grouse is peculiar to the country, and the snow-partridge (*Lerva nivicola*) and the snow-cock (*Tetraogallus tibetanus*) are occasionally met with in the uplands, while the ordinary partridge (*Perdix hodgsoni*) is common in the ravines on the plateau.

People.—The Tibetan race, which probably belongs to the Turko-Mongol stock, is divided between the nomadic tent-dwelling Tibetans of the lake region and transition zone between it and the river region, and the settled sedentary population of the valleys. The tent-dwelling Tibetans, called Dokpa or Drupa (spelt *hbrog-pa*), or "Steppe-dwellers," are generally of a more Mongolized type than the people of the lowlands. The males measure about 5 ft. 5 in., except in eastern Tibet, where 5 ft. 9 in. is a common stature; the females are appreciably less. The head is mesati-cephalic, verging on brachycephalic in the case of many of the Dokpa; the hair is black and somewhat wavy; the eyes are usually of a clear brown, in some cases even hazel; the cheek-bones are high, but not so high as with the Mongols; the nose is thick, sometimes depressed at the root, in other cases prominent, even aquiline, though the nostrils are broad. The teeth are strong but irregular; the ears, with tolerably large lobes, stand out from the head, but to a less degree than with the Mongols. The mouth is broad, the lips not full, and, among the people of the lower altitudes, decidedly thin. The beard is sparse, and, with the exception of the moustache, which is sometimes worn, especially in central Tibet, it is plucked out with tweezers. The shoulders are broad, the arms round; the legs are not well developed, the calf is especially small. The foot is somewhat small but broad, the hand coarse. The women are usually stouter than the men. The colour of the skin of the Tibetans is a light brown, sometimes so light as to show ruddy cheeks in children; where exposed to the weather it becomes a dark brown. Their voices are full, deep and powerful. They can endure exposure without much apparent inconvenience; and though the nature of the food they use is such that they cannot stand absolute privation for any considerable length of time, they can exist for long periods on starvation rations, if eked out with weak soup or buttered tea, which is drunk at frequent intervals.

The sedentary population of Tibet has to a greater or less degree the same physical traits as the Dokpa, but as one approaches China, India or the border lands generally, one observes that the admixture of foreign blood has considerably modified the primitive type. Among the customs of the Tibetans, perhaps the most peculiar is polyandry, the brothers in a family having one wife in common. Monogamy, however, seems to be the rule among the pastoral tribes, and polygamy is not unknown in Tibet, especially in the eastern parts of the country.

Their religion is described under Lamaism.

(L. A. W.; T. H. H.*)

Language.—The language of Tibet bears no special name, it is merely known as "The Speech of Bod or Tibet," namely, *Bod-skad* (pronounced *Bhö-kä*), while the vernacular is called *P'al-skad* or "vulgar speech," in contradistinction to the *rje-sa* or "polite respectful speech" of the educated classes, and the *ch'os-skad* or "book language," the literary style in which the scriptures and other classical works are written.

It is not a uniform speech, but comprises several dialects which have been classed by Jaeschke into three groups, namely (1) the central or the dialects of Lhasa and the central provinces of Ü and Tsang (including Spiti) which is the *lingua franca* of the whole country, (2) the western dialects of Ladak, Lahul, Baltistan and Purig, and (3) the eastern dialects of the province of Khams. In addition to these, however, are many sub-dialects of Tibetan spoken in the frontier Himalayan districts and states outside Tibet, namely, in Kunawar and Bashahr, Garhwal, Kumaon, Nepal including especially the Serpa and Murmi of eastern Nepal, Sikkim (where the dialect is called Dänjong-kä), Bhutan (Lho-kä or Duk-kä), all of which are affiliated to a central group of dialects. Farther east the Takpa of Tawang in the eastern Assam Himalayas appears to form a transition between the central and the Sifan group of dialects on the Chinese frontier, which includes the Minyak, Sungpan, Lifan and Tochu dialects. On the north bordering on Turkestan the dialect of the nomadic Hor-pa tribes is much mixed with Turkic ingredients. The number of speakers of Tibetan dialects is probably not far short of eight millions.

Linguistically, Tibetan is allied to the Burmese languages, and forms with the latter a family of the so-called Turano-Scythian stock called "Tibeto-Burman" (*q.v.*), the unity of which family was first recognized by Brian Hodgson in 1828, and indeed several of the dialects of Tibetan are still only known through the copious vocabularies collected by him. The little that was known of the Tibetan language before Hodgson's time was mainly derived from the writings of the Romish friars who resided for several years in Lhasa in the first half of the 18th century.[1] The first serious European student of Tibetan was Csoma de Körös (1784–1842), an indefatigable Hungarian, who devoted his life to the study of this language and the ancient Buddhist records enshrined in its unknown literature. For this purpose he resided like a monk for several years among the lāmas at the monasteries of Zangla and Pukdal in Zanskar and latterly at Kanum in upper Bashahr, enjoying the assistance of learned lāmas. His *Tibetan-English Dictionary*, and pioneer *Tibetan Grammar*, both published in 1834, opened to Europeans the way to acquire a knowledge of the Tibetan language as found in the ancient classics.[2] The next great advance in the study of the Tibetan language we owe to the labours of H. A. Jeaschke of the Moravian mission which was established in Ladak in 1857. This scholarly linguist, equipped with modern methods of scientific research, did not confine himself to the classical period like Csoma, but extended his investigations to the language as a whole, and provided Europeans for the first time with the means of making a practical study of modern Tibetan and the speech of the people His *Tibetan-English Dictionary* and *Tibetan Grammar* are models of scientific precision and important sources of our knowledge of the structure and development of the language, and the former is not superseded by Chandra Das's Dictionary.[3]

Grammar. The language was first reduced to writing with the assistance of Indian Buddhist monks in the middle of the 7th century A.D. by Thonmi, a Tibetan layman. The letters, which are a form of the Indian Sanskrit characters of that period, follow the same arrangement as their Sanskritic prototype. The consonants, 30 in number, which are deemed to possess an inherent sound *a*, are the following: *ka, k'a, ga, nga, ča, č'a, ja, nya, ta, t'a, da, na, pa, p'a, ba, ma, tsa, ts'a, dza, wa, z'a, za, 'ha, ya, ra, la, s'a, sa, ha, a;* the so-called Sanskrit cerebrals are represented by the letters *ta, t'a, da, na, s'a*, turned the other way. *Ya*, when combined as second consonant with *k-, p-, m-*, is written under the first letter. *Ra*, when combined as second letter with *k-, t-, p-*, is written under the first, and when combined with another consonant as first letter over the second. The vowels are *a, i, u, e, o*, which are not distinguished as long or short in writing, except in loan words transcribed from the Sanskrit, &c., though they are so in the vernaculars in the case of words altered by phonetic detrition. By means of agglutination, that is, by adding to the bases form-words as prefixes, suffixes or infixes, the Tibetan language has developed a considerable grammatical system and is now agglutinating rather than isolating. Agglomerations of consonants are often met with as initials, giving the appearance of telescoped words—an appearance which historical etymology often confirms. Many of these initial consonants are silent in the dialects of the central provinces, or have been resolved into a simpler one of another character. The language is much ruled by laws of euphony, which have been strictly formulated by native grammarians. Among the initials, five, viz. *g, d, b, m, 'h*, are regarded as prefixes, and are called so for all purposes, though they belong sometimes to the stem. As a rule none of these letters can be placed before any of the same organic class. Post-positions, *pa* or *ba* and *ma*, are required by the noun (substantive or adjective) that is to be singled out; *po* or *bo* (masc.) and *mo* (fem.) are used for distinction of gender or for emphasis. The cases of nouns are indicated by suffixes, which vary their initials according to the final of the nouns. The plural is denoted when required by adding one of several words of plurality. When several words are connected in a sentence they seldom require more than one case element, and that comes last. There are personal, demonstrative, interrogative and reflexive pronouns, as well as an indefinite article, which is also the numeral for "one." The personal pronouns are replaced by various terms of respect when speaking to or before superiors, and there are many words besides which are only employed in ceremonial language.

[1] The Capuchin friars who were settled in Lhasa for a quarter of a century from 1719 studied the language; two of them, Francisco Orazio della Penna, well known from his accurate description of Tibet, and Cassian di Macerata sent home materials which were utilized by the Augustine friar Aug. Ant. Georgi of Rimini (1711–1797) in his *Alphabetum tibetanum* (Rome, 1762, 4to), a ponderous and confused compilation, which may be still referred to, but with great caution. The Tibetan characters were drawn by Della Penna and engraved by Ant. Fontarita in 1738. In 1820 Abel Rémusat published his *Recherches sur les langues tartares*, a chapter of which was devoted to Tibetan.

[2] The first Tibetan dictionary for Europeans was a *Dictionary of the Bhotanta or Bhutan Language*, published at Serampur near Calcutta in 1828. It was, however, crude and unedited and contained many serious mistakes, having been taken from the MS. notes of an unknown Italian priest (now believed to be Father Juvenal of Agra, who had been stationed near the frontier of Bhutan), whose MS. was translated into English by Fr. Chr. G. Schroeter and published without supervision by any Tibetan scholar; and Csoma was unaware of its existence when compiling his dictionary. At St Petersburg J. J. Schmidt published his *Grammatik der tibetischen Sprache* in 1839 and his *Tibetisch-deutsches Wörterbuch* in 1841, but neither of these works justified the great pretensions of the author, whose access to Mongolian sources had enabled him to enrich the results of his labours with a certain amount of information unknown to his predecessors. In France, P. E. Foucaux published in 1847 a translation from the *Rgya tcher rol-pa*, the Tibetan version of the *Lalita Vistara*, and in 1858 a *Grammaire thibétaine*; while Ant. Schiefner had begun at St Petersburg in 1849 his series of translations and researches. His *Tibetische Studien* (1851–1868) is a valuable collection of documents and observations. In 1861 Lepsius published his paper *Ueber chinesische und tibetische Lautverhältnisse*; and after 1864 Léon Feer brought out in Paris many translations of texts from Tibetan Buddhist literature. In 1828–1849 the *Journal* of the Asiatic Society of Bengal published comparative vocabularies of spoken and written Tibetan by Brian H. Hodgson, and grammatical notices of Tibetan (according to Csoma's grammar).

[3] Jaeschke from 1860 to 1867 made several important communications, chiefly with reference to the phonetics and the dialectical pronunciation, to the academies of Berlin and St Petersburg, and in the *Journal* of the Asiatic Society of Bengal. In 1868 at Kyelang he published by lithography *A Short Practical Grammar of the Tibetan Language, with special reference to the spoken dialects*, and the following year a *Romanized Tibetan and English Dictionary*. He also published in 1871–1876 at Gnadau in Prussia by the same process a Tibetan and German dictionary. Afterwards he prepared for the English Government a *Tibetan-English Dictionary, with special reference to the prevailing dialects*, in 1881. Dr H. Wenzel, one of his pupils, edited in 1883 from his MS. a *Simplified Tibetan Grammar*. Major Th. H. Lewin with the help of a Sikkimese lama compiled *A Manual of Tibetan*, or rather a series of colloquial phrases in the Sikkimese dialect, in 1879. In 1894 Mr Graham Sandberg compiled a useful *Handbook of Colloquial Tibetan*. Père Desgodins in 1899 issued from Hong-Kong a large Tibeto-Latin-French dictionary, *Dictionnaire thibétain-latin-français*. In 1890 Captain H. Ramsay published at Lahore his useful *Practical Dictionary of Western Tibet*. In 1902 was brought out at Calcutta Sarat Chandra Das's *Tibetan English Dictionary with Sanskrit synonyms*, a massive volume compiled with the aid of Tibetan lamas and edited by Graham Sandberg and the Moravian missionary A. W. Heyde. The *Tibetan Manual* by V. C. Henderson (1903) is a useful work, and so is the *Manual of Colloquial Tibetan* by C. A. Bell (Calcutta, 1905), which has full English-Tibetan vocabularies, graduated exercises and examples in the Lhasa dialect of to-day. An interesting and important analysis of many of the dialects and of the general structure of the language has been made by Dr G. A. Grierson, with the collaboration of Dr S. Konow, in his *Linguistic Survey of India* (1908). As regards native philology, the most ancient work extant is a grammar of the Tibetan tongue preserved in the *Bstan-hgyur* (mdo cxxiv.). This collection also contains other works of the same kind, dictionaries by later writers, translations of many Sanskrit works on grammar, vocabulary, &c., and bilingual dictionaries, Sanskrit and Tibetan. As separate publications there are several vocabularies of Chinese and Tibetan; Mongol and Tibetan; Chinese, Manchu, Mongol, Oelöt, Tibetan and Turkish; Tibetan, Sanskrit, Manchu, Mongol and Chinese.

The verb, which is properly a kind of noun or participle, has no element of person, and denotes the conditions of tense and mood by an external and internal inflexion, or the addition of auxiliary verbs and suffixes when the stem is not susceptible of inflexion, so that instead of saying "I go," a Tibetan says "my going." The conditions which approximate most closely to our present, perfect, future and imperative are marked either by aspiration of the initial or by one of the five prefix consonants according to the rules of euphony, and the whole looks like a former system thrown into confusion and disorder by phonetic decay. As to the internal vowel, *a* or *e* in the present tends to become *o* in the imperative, the *e* changing to *a* in the past and future; *i* and *u* are less liable to change. A final *s* is also occasionally added. Only a limited number of verbs are capable of four changes; some cannot assume more than three, some two, and many only one. This deficiency is made up by the addition of auxiliaries or suffixes. There are no numeral auxiliaries or segregatives used in counting, as in many languages of eastern Asia, though words expressive of a collective or integral are often used after the tens, sometimes after a smaller number. A good deal of new research on the grammar is to be found in Grierson's *Linguistic Survey of India*, part III., 1908. In scientific and astrological works, the numerals, as in Sanskrit, are expressed by symbolical words. In the order of the sentence the substantive precedes the adjective and the verb stands last; the object and the adverb precede the verb, and the genitive precedes the noun on which it depends—this contrasts with the order in the isolating Chinese, where the order is subject, verb, object. An active or causal verb requires before it the instrumental instead of the nominative case, which goes only before a neuter or intransitive verb. The chief differences between the classical language of the Tibetan translators of the 9th century and the vernacular, as well as the language of native words, existed in vocabulary, phraseology and grammatical structure, and arose from the influence of the translated texts.

Philology.

The Tibetan language, presenting such marked differences between its written and spoken forms, has a great interest for philologists, on account of its bearing on the history of the monosyllabic languages of eastern Asia, with their so-called "isolation" or absence of form-words and consequently of grammatical forms. Is the Tibetan a monosyllabic language passing to agglutination, or the reverse? The question has turned mainly upon the elucidation of the phenomenon of the silent letters, generally prefixed, which differentiate the spelling of many words from their pronunciation, in the central dialect or current speech of Lhasa. Rémusat rather dubiously suggested, while Schmidt and Schiefner maintained, that the silent letters were a device of grammarians to distinguish in writing words which were not distinguished in speech. But this convenient opinion was not sufficient for a general explanation, being supported by only a few cases. Among these are—(*a*) the addition of silent letters to foreign words in analogy with older terms of the language (*e.g.* the Persian *tadjik* was transcribed *staggzig* or "tiger-leopard," because the foreign term left untouched would have been meaningless for Tibetan readers); (*b*) the addition for the sake of uniformity of prefixed letters to words etymologically deprived of them; (*c*) the probable addition of letters by the Buddhist teachers from India to Tibetan words in order to make them more similar to Sanskrit expressions (for instance *rje-* for "king," written in imitation of *raja*, though the original word was *je* or *she*, as is shown by cognate languages). On the other hand, while phonetically the above explanation was not inconsistent with such cases as r*ka* d*kah*, b*kah*, bs*ka*, and *nga*, r*nga*, *nga*g, s*ngag*s, l*nga*, *nga*d and brt*se*, brd*zun*, db*yar*, &c., where the italicized letters are pronounced in full and the others are left aside, it failed to explain other cases, such as *dgra*, *mgron*, *spyod*, *spyan*, *sbrang*, *sbrul*, *bkra*, *k'ri*, *krad*, *k'rims*, *k'rus*, &c., pronounced *ḍa*, *ḍon*, *čod*, or *šwod*, *čen*, *dang*, *ḍeu*, *ṭa*, *t'i*, *tad* or *teh*, *t'im*, *tu*, &c., and many others, where the spoken forms are obviously the alteration by wear and tear of sounds originally similar to the written forms. Csoma de Körös, who was acquainted with the somewhat archaic sounds of Ladak, was able to point to only a few letters as silent. Foucaux, in his *Grammaire* (1858), quoted a fragment from a native work on grammar several centuries old, in which the pronunciation of the supposed silent letters is carefully described. Since then the problem has been disentangled; and now minor points only remain to be cleared up. Jaeschke devoted special attention to the dialectical sounds, and showed in several papers and by the comparative table prefixed to his dictionary that in the western and eastern dialects these sounds correspond more or less closely to the written forms.

Tones.

Jaeschke first noted the existence of tones in Tibetan, and these have been found by Professor Conrady to have developed on the same lines as in Chinese. Thus intransitive bases seem to have begun only with soft consonants, and it is doubtful whether the parent tongue possessed hard consonants at all; while transitive bases were formed by hardening of the initial consonants and at the same time pronouncing the words in a higher tone, and these two latter changes are supposed to have been indicated by a prefix to the base-word. Many of these old soft initial consonants which are now hardened in the modern dialects are preserved in classical Tibetan, *i.e.* in Tibetan of the 7th to the 9th century A.D. The old language seems to have pronounced prefixes extensively which in modern pronunciation in central Tibet are largely lost, whilst the soft initials have become aspirated or hardened and tones have developed, and in the west and east, where prefixes and soft initials have been preserved, there are no tones. Thus the valuable testimony of these dialects may be added to the evidence furnished by foreign transcriptions of Tibetan words, loan words in conterminous languages, and words of common descent in kindred tongues. And the whole shows plainly that the written forms of words which are not of later remodelling are really the representatives of the pronunciation of the language as it was spoken at the time of the transcription.

The concurrence of the evidence indicated above enables us to form the following outline of the evolution of Tibetan. In the 9th century, as shown by the bilingual Tibeto-Chinese edict at Lhasa, there was relatively little difference between the spoken and the written language. Soon afterwards, when the language was extended to the western valleys, many of the prefixed and most of the important consonants vanished from the spoken words. The *ya-tag* and *ra-tag*, or *y* and *r* subscript, and the *s* after vowels and consonants, were still in force. The next change took place in the central provinces; the ra-tags were altered into cerebral dentals, and the ya-tags became *č*. Later on the superscribed letters and finals *d* and *s* disappeared, except in the east and west. It was at this stage that the language spread in Lahul and Spiti, where the superscribed letters were silent, the *d* and *g* finals were hardly heard, and *as*, *os*, *us* were *ai*, *oi*, *ui*. The words introduced from Tibet into the border languages at that time differ greatly from those introduced at an earlier period. The other changes are more recent and restricted to the provinces of Ü and Tsang. The vowel sounds *ai*, *oi*, *ui* have become *ē*, *ō*, *ū*; and *a*, *o*, *u* before the finals *d* and *n* are now *ä*, *ö*, *ü*. The *mediae* have become aspirate tenues with a low intonation, which also marks the words having a simple initial consonant; while the former aspirates and the complex initials simplified in speech are uttered with a high tone, or, as the Tibetans say, "with a woman's voice," shrill and rapidly. An inhabitant of Lhasa, for example, finds the distinction between *s'* and *z'*, or between *s* and *z*, not in the consonant, but in the tone, pronouncing *s'* and *s* with a high note and *z'* and *z* with a low one. The introduction of the important compensation of tones to balance phonetic losses had begun several centuries before, as appears from a Tibetan MS. (No. 462*b* St Petersburg) partly published by Jaeschke (*Monatsber. Akad. Berl.*, 1867). A few instances will serve to illustrate what has been said. In the bilingual inscriptions, Tibetan and Chinese, set up at Lhasa in 822, and published by Bushell in 1880, we remark that the silent letters were pronounced: Tib. *spudgyal*, now *pugyal*, is rendered *suh-pot-ye* in Chinese symbols; *khri*, now *t'i*, is *kieh-li*; *hbrong* is *puh-lung*; *snyan* is *sheh-njoh* and *su-njoh*; *srong* is *su-lun*, *su-lung* and *si-lung*. These transcriptions show by their variety that they were made from the spoken and not from the written forms, and, considering the limited capacities of Chinese orthoepy, were the nearest attempt at rendering the Tibetan sounds. *Spra* or *spreu* (a monkey), now altered into *ḍeu* at Lhasa, *ṭeu* in Lahul, Spiti and Tsāng, is still more recognizable in the Gyarung *shepri* and in the following degenerated forms—*shreu* in Ladak, *streu-go* in Khams and in cognate languages, *soba* in Limbu, *saheu* in Lepcha, *simai* in Tablung Naga, *sibeh* in Abor Miri, *shibe* in Sibsagar Miri, *sarrha* in Kol, *sara* in Kuri, &c. *Grog*-ma (ant), now altered into the spoken *ṭ'oma*, is still *kyoma* in Bhutan, and, without the suffix, *korok* in Gyarung, *k'oro-* in Sokpa, *k'orok*, *k'alek* in Kiranti, &c. *Grang*-po-(cold), spoken *ṭ'ammo*, is still *grang*-mo in Takpa, *k'yam* in Burmese, &c. A respectful word for "head" is *ü*, written *dbu*, which finds its cognates in Murmi *thobo*, Sibsagar Miri *tub*, &c. *Bya* (bird), spoken *cha*, is still *pye* in Gyarung. *Brjod* (to speak), pronounced *jod*, is cognate to the Burmese *pyauhtso*, the Garo *brot*, &c. The word for "cowries" is *'gron-* in written, *rum-* in spoken Tibetan, and *grwa* in written Burmese; *slop* (to learn), spoken *lop*, is *slop* in Melam. "Moon" is *zlava* in written and *dawa* in spoken language, in which *-va* is a suffix; the word itself is *zla-*, cognate to the Mongol *ssara*, Sokpa *sara*, Gyarung *t-sile*, Vayu *cholo*, &c. The common spoken word for "head" is *go*, written *mgo*, to which the Manipuri *moko* and the Mishmi *mkura* are related. Sometimes the written forms correspond to double words which have disappeared. For instance, *gye* (eight), which is written *brgyad* and still spoken *vrgyad* in Balti in the west and Khams in the east, is *gyäd* in Ladak, Lahul, Tsang and Ü. The same word does not appear elsewhere; but we find its two parts separately, such as Gurung *pre*, Murmi *pre*, Taksya *phre* and Takpa *gyet*, Serpa *gye*, Garo *chet*, &c. *Rta* (horse) is reduced to *ta* in speech, but we find *ri*, *rhyi*, *roh* in Sokpa, Horpa, Tochu, Minyak, and *tā*, *tah*, *teh*, *t'ay* in Lhopa, Serpa, Murmi, Kami, Takpa, &c., both with the same meaning. Such are the various pieces of evidence obtained from an endless number of instances. The cases referred to above do not, owing to the difference of the causes, yield to any explanation of this kind. And it must be admitted that there are also many cases, some of them caused by irregularities of writing, modification of spelling by decay, and by a probable use of prefixes still unascertained, which also resist explanation, though the account just given stands good whatever solution the question of prefixes may receive in future.

Literature.—The religious literature, which is very considerable, is referred to under LAMAISM. The non-religious literature of Tibet is not extensive, probably owing to the printing being in the hands of the priests. One of the most popular and widely circulated books is called *The Hundred Thousand Songs of the Venerable Milaraspa.* Their author Milaraspa (unless the work should be attributed to his disciples), often called Mila, was a Buddhist ascetic of the 11th century, who, during the intervals of meditation travelled through the southern part of middle Tibet as a mendicant friar, instructing the people by his improvisations in poetry and song, proselytizing, refuting and converting heretics, and working manifold miracles. His legends are not without wit and poetical merit. An equally popular book is the *Love Songs of Ts'angs-dbyangs rgyamts'o*, attributed to the dissipated young Dalai lāma who was deposed in 1701 (see LHASA). There are a number of poems written in an elevated style, also dramatic works chiefly of the character of mystery plays, and collections of fairy tales and fables. The *Kesar Epic*, which has been translated by A. H. Francke under the title of the *Kesar Saga*, is a widely known tale of a heroic warrior king of northern Asia named Kesar (believed by some to be a transcription of "Czar"), but it is not found as a printed book. Several collections of folk songs have also been published by A. Francke from Ladak. A long story book, called the *Djiung yi* (*Sgrungs gyi gsungs?*), and regarded as the national epic in Khām, has been partly seen by Desgodins and Baber. It is in prose; but the dialogue, interspersed with songs, is metrical, and is much more extensive than the prose framework. Religious discussions and philosophical dissertations alternate with comic episodes. It includes three divisions—the *Djiung ling*, which describes the invasion of part of Tibet by the Djiung or Moso; the *Hor ling*, which recounts the conquest of the Hor (Turk tribes) by the Tibetans, and conveys much historical information in a tale of magic and marvel; and the *Djia ling* (Chinese division), which narrates a contest of unknown date between the Tibetans and the Chinese. This work has apparently never been published, and even the manuscripts of the three divisions cannot, says Baber, be obtained in a complete form. But every Tibetan, or at least every native of Khām, who possesses any education, is able to recite or to chant passages of great length. Another Tibetan epic in Khaur, the *Gyaldrung*, praises Dagyolong, a famous warrior who subdued the savage men of Khām. Dramatic works exist, as also a version of the *Ramayana* in the first volume of the *Bstodts'ogs* of the *Bstan-hgyur*.

Writing.—Writing was not introduced until the 7th century. Notched sticks (*shing-chram*) and knotted cords were in current use, but the latter contrivance is only faintly alluded to in the Tibetan records, while of the other there are numerous examples. No mention is anywhere made of a hieroglyphical writing, but on the eastern frontier the medicine-men or *tomba* of the Moso have a peculiar pictorial writing, which is known in Europe from two published MSS. (in *Journ. Roy. Asiatic Soc.*, 1885, vol. xvii.); though apparently now confined solely to purposes of witchcraft, it perhaps contains survivals of a former extensive system superseded by the alphabetic writing introduced from India. According to tradition—a tradition of which the details are still open to criticism—the alphabet was introduced from India by Tonmi, a lay Tibetan minister who was sent to India in 632 by King Srong-btsan to study the Sanskrit language and Buddhist literature. Tonmi introduced the modified Sanskritic "writing in thirty characters" (already detailed under *Language* and six of which do not exist in Sanskrit) in two styles—the "thick letters" or "letters with heads" (*u-ch'en*), now commonly used in printed books, and the half-cursive "cornered letters," so called from their less regular heads. The former are traditionally said to have been derived from the Landza character. The Landza of Nepal, however, is certainly not the origin of the Tibetan letter, but rather an ornamental development of the parent letter. The close resemblance of the Tibetan characters "with heads" to the Gupta inscriptions of Allahabad shows them to have been derived from the monumental writing of the period; and various arguments appear to show that the other Tibetan letters came from the same Indian character in the style in which it was used in common life. The Tibetan half-cursive was further developed into the more current "headless" (*u-med*) characters, of which there are several styles. The ancient manuscripts discovered by Dr M. Aurel Stein in Khotan seem to include very early, if not the earliest known, Tibetan documents. (L. A. W.; T. DE L.)

Political Divisions.—Tibetans divide their country into five provinces: (1) *Amdo*, which comprises that part of the Chinese province of Kansuh which is inhabited by Tibetans, and Koko Nor region, extending southwards to the Yellow river and westwards as far as the Tsaidam. Amdo is inhabited in its eastern part by Tibetans, called Rongwa or "ravine-folk," who are agriculturists, and in the western by pastoral tribes, collectively called Panaka or the Three Panakas. (2) *Khams* or *Khamdo*, which includes all eastern Tibet between the Chinese provinces of Szechuen and Yunnan, and the district of Lhorong jong, which forms the eastern border of the Lhasa-governed territory. This province is divided into the five Horba tribes, the eighteen Nyarong states in the valley of the upper Yalung, and the districts of Litang, Batang, Dergē, Gartok Chiamdo and Draya. In Khamdo, but subject to the direct rule of Lhasa, are several small districts, the principal are Nyarong, Tsarong, and Mar Khams or "Lower Khamdo." Most of these districts are governed by *dēba* or chiefs, while a few have kings or *gyalpo*, the most powerful of the latter being the king of Dergē, famous for its inlaid metal and leather work, and of Chagla, or, as it is better known, Tachienlu, as it is called by the Chinese or the Dartsemdo of the Tibetans, the headquarters of the tea trade with China. Khamdo is under the direct rule of the Chinese provincial authorities of Szechuen. Some of its rulers send also tribute missions to Peking. For convenience of classification we may include in Khamdo a long strip of country extending along the northern border of the Lhasa territory of Lhorong jong and Larego as far as Tengri Nor, and bounded to the north by the Dang-la mountains, which is designated by Tibetans as *Gyade* or "the Chinese province." This strip of country has its own native chiefs, but is under the control of a high Manchu officer stationed at Lhasa, known colloquially as the "superintendent of savage tribes." (3) The third political division of Tibet is *Ü* (written Dbus), meaning "Central." It includes Lhasa and a large number of outlying districts in south-eastern Tibet, such as Po, Pemakoichen, Zayul. The pastoral or Dokpa tribes, north and north-east of Tengri Nor, are also under its rule. (4) The fourth division of Tibet, called *Tsang*, includes all south-west Tibet from the Lhasa or Central province to the Indian frontier as far as Lake Manasarowar. (5) The fifth division, called *Nāri* (Mngah-ris) by the Tibetans or *Hūndēsh* by the Indians, who call the inhabitants Hūniyas, comprises the whole country around the sources and along the upper course of the Indus and the Sutlej, and also all north-western Tibet generally, as far as Ladak and the border of Kashmir. Tsang and Nari are under the rule of Lhasa, all the high civil and military authorities in these provinces holding their offices from it. These five provinces, however, do not include the elevated steppes of Tsaidam (extending between the Kuen-lun and the Altyn Tagh or Nan Shan ranges), inhabited by a mixed race of marauding people, Tunguts and Mongols. Yet Tsaidam is geographically but a northern extension of the great Tibetan plateau, and in most of its essential physical features it is more closely allied to the Chang-t'ang of the south than to the great sandy depressions of Chinese Turkestan or Mongolia on the north.

Government.—Though the whole of Tibet is under the suzerainty of China, the government of the country is divided into two distinct administrations, the one under the rule of the Dalai lama of Lhasa, the other under local kings or chiefs, and comprising a number of ecclesiastical fiefs. Both are directed and controlled by the high Chinese officials residing at Lhasa, Sining Fu, and the capital of the Chinese province of Szechuen. North-eastern Tibet or Amdo, and also a portion of Khamdo, are under the supervision of a high official (Manchu) residing at Sining Fu in Kansuh, whose title is Imperial Controller-General of Koko Nor. The native chiefs of the Panaka and other Tibetan tribes of this region are styled *pōmbo* ("official" or "headman") by both the natives and the Chinese. The region under the supervision of the imperial controller includes all the countries north of the upper course of the Dre chu (Yangtsze-kiang). The people pay a small poll-tax to China, and are exempted from any other impost; they also pay a small tax in kind, sheep, butter, &c., to their chiefs. The province of Khamdo, including all eastern Tibet, is governed by local chiefs, styled *gyalpo*, "king," and *dēba*, "chief," succession to the chieftainship being usually assured to the eldest son not a lama. Each chief appoints a certain number of civil and military officers to assist in the government of the country, and each village has its headman or *besē*, also an hereditary office. None of these officials receive salaries; they are only exempt from taxation, and some have grants of land made to them. The only tax paid to China is a so-called "horse-tax" of about 5d. for each family. Once in every five years the chiefs send a tribute mission to the capital of Szechuen, and once every ten years to Peking, but the tribute sent is purely nominal. The Chinese maintain a few small military posts with from six or eight to twenty men stationed in them; they are under the orders of a colonel residing at Tachienlu. There are also a few lama chiefs.

The part of Tibet under the rule of Lhasa, by far the largest and wealthiest, includes the central province of Ü, Tsang, Nari and a number of large outlying districts in southern and even in eastern Tibet. The central government of this part of the country is at Lhasa; the nominal head is the Dalai lama or grand lama. The Tashi lama or head of the monastery of Tashilhunpo near Shigatse is inferior to the Dalai lama in secular authority, of which, indeed, he has little—much less than formerly—but he is considered by some of his worshippers actually superior to him in religious rank. The person next in consideration to the two great lamas is the regent, who is an ecclesiastic appointed during the minority of each Dalai lama. Under him are four ministers of state (*sha-pē* or *kalön*), who divide among themselves, under the immediate supervision of the two imperial Chinese residents (or *amban*), the management of all secular affairs of the country. There is also a Tsong-du or National Assembly, divided into a greater assembly, including all government officials, and called together only to decide on matters of supreme importance, and a lesser assembly, consisting of certain high officials of Lhasa, noblemen, and delegates from the monasteries of Debung, Sera and Galdan, and fairly constantly in session. The Tsong-du discusses all matters of importance, especially relating to foreign policy, and its decisions are final. The army is under the command of the senior Chinese amban, a Tibetan generalissimo or *mag-pön*, and six Tibetan generals (*dah-pön* or *de-pön*). The military duties of the generals are slight, but their political status is high. Under the *dah-pön* are six *rüpön* or colonels, and a number of subordinate officers. The regular army consists (in theory) of 6000 men, on active service for three years, and at home on half-pay for three years. After the six years they pass into the reserve or militia (*yulmag*). The taxes paid to the Lhasa government are mostly in kind, sheep, ponies, meal, butter, wool, native cloth, &c., and the coin paid is said to be about 130,000 ounces of silver a year. Chandra Das states that the crown revenues of Lhasa amount to about 2,000,000 rupees annually. All high Tibetan officials, whether ecclesiastics or laymen, are appointed subject to confirmation by the Chinese government. The administrative subdivisions of the Lhasa country, of which there are fifty-four, are called *jong*, or "prefecture," each of which is under the rule of two *jong-pon*, the one a lama, the other a layman. They collect all taxes, are responsible for the levy of troops, the courier service, corvées, &c., and exercise judicial functions, corresponding directly with Lhasa. There are 123 sub-prefectures under *jong-nyer*. Under them are village headmen or *tso-pön*, headmen or *mi-pön*, and elders or *gyan-po*. All are appointed for indefinite periods by the prefects.

Industries and Trade.—The industries are confined to the manufacture of woollen cloth of various degrees of fineness and colour, and called *truk*, *tirma* and *lawa*, to that of small rugs, pottery of an inferior quality, utensils of copper and iron, some of which show considerable artistic skill in design, and to such other small trades as are necessary to supply the limited wants of the people. The best artisans are Nepalese and Chinese, the former being the best workers in metal and dyers.

Trade Routes, &c. The great trade routes are, first, that which, starting from Cheng-tu, the capital of the Chinese province of Szechuen, passes by way of Tachienlu or Dartsedo, Litang, Batang, Chiamdo, Larego, Lhasa, Gyantse, Shigatse, reaches the Nepalese frontier at Nielam and goes thence to Katmandu. This route is called *Gya-lam*, "the China road" (or "high road"); the great bulk of Tibetan travel goes over it. Minor roads go from Sining Fu in the Chinese province of Kansuh via Tsaidam and the Tang la pass to Nagchuka and Lhasa. This road, called the *Chang lam* or "northern road," was much used by traders till the middle of the 19th century, when the Mahommedan rebellions in north-western China practically closed it. Another road starts from Sung-pan in north-western Szechuen, and, by way of the sources of the Yellow River, joins the Gya-lam at Chiamdo; it is little used, as it passes through the country of the wild marauding Golok. Still another route starts from Tachienlu, and by the valley of the Yalung and the Dze chu runs to Yekundo, and thence to Chiamdo. From this point it leads to Riwoche, and then through Gyade or Chinese province to Nagchuka and Lhasa. An important trade road starts from Likiang Fu in Yunnan, and by way of Chung-tien (Guiedam of the French missionaries) joins the Gyalam at Batang.

The most direct route from India to Lhasa, and that most frequented by the traders of Lhasa, is by the Chumbi Valley, and was followed by the British Mission. It crosses the Himalayas by the Tang Pass (15,200 ft.), and thence proceeds via Gyantse (13,200 ft.) and the Kharo Pass (16,500 ft.), Yamdok Lake (15,000) to the Tsang-po (12,100 ft.), and crossing the river winds up along the Kyi Chu, on which Lhasa stands, 33 m. from the Tsang-po. The total distance from Siliguri railway station is 357 m. From Katmandu, the capital of Nepal, a difficult mountain route runs by Kirong to the No la (16,600 ft.), descending from which pass it strikes the Tsangpo about midway between Lhasa and Lake Manasarowar. Farther west Tibet may be reached from Kumaon by one of a group of passes (of which the best known is the Milam) leading to Lake Manasarowar. The lake becomes a sort of obligatory point on all routes to Tibet which lie between Ladak and Nepal. The Shipki road from Simla, which strikes the Sutlej at Totling (where there is a bridge), leads up to Manasarowar, coinciding with the great high-road (*Changlam*) after passing Totling. The remarkable area of gold-mining industry which lies to the north-east of Gartok is reached by another route from Leh, which, crossing the Chang la close to Leh, passes by Rudok at the eastern extremity of Lake Pangong in a south-easterly direction, running north of the great mountain masses which crowd round the Indus sources. It continues through the central lake district to Tengri Nor and Lhasa. The principal trade with China is carried on over the Lhasa-Tachienlu road.

According to a summary furnished by Lieut.-Colonel Waddell (*Lhasa and its Mysteries*), the chief imports from China are silk, carpets, porcelain and tea-bricks. From Mongolia come leather, saddlery, sheep and horses, with coral, amber and small diamonds from European sources; from Kham perfumes, fruits, furs and inlaid metal saddlery; from Sikkim and Bhutan rice, musk, sugar-balls and tobacco; from Nepal broadcloth, indigo, brasswork, coral, pearls, sugar, spices, drugs and Indian manufactures; from Ladak saffron, dried fruits and articles from India. In the market at Lhasa opium sells for its weight in silver. The exports from Tibet are silver, gold, salt, wool, woollen cloth, rugs, furs, drugs, musk. By the Nepal, Kumaon and Ladak routes go borax, gold and ponies. Patna in Bengal is the chief market for the Nepal trade; Diwangiri and Udalguri for Assam, and Darjeeling and Kalimpong for Sikkim and Chumbi. One of the most universal articles of consumption in Tibet is the Chinese brick-tea, which even passes as currency. The tea imported from Szechuen is for the most part of very inferior quality, estimated at 35% tea-leaves and 65% twigs and other material. It is compressed into large bricks, and costs two-thirds of a penny per pound. Efforts have been made by the planters of the Duars to prepare Indian brick-tea for the Tibetan market, which is calculated to consume some 11,000,000 lb yearly.

Money.—It is curious that Tibet, though using coined money, seems never, strictly speaking, to have had a coinage of its own. Till nearly the end of the 18th century the coinage had for a long time been derived from Nepal. That valley prior to the Gurkha domination (1768) was under three native dynasties (at Bhatgaon, Patan and Katmandu), and these struck silver mohurs, as they were called, of the nominal value of half a rupee. The coins were at first not struck specially for Tibetan use, but were so afterwards. These latter bore (obverse) a Nepalese emblem surrounded by eight fleurons containing the eight sacred Buddhist jewels, and (reverse) an eight-petalled flower surrounded by eight fleurons containing the names of the eight jewels in Tibetan characters. Ingots of Chinese silver were sent from Lhasa with a small proportion of gold dust, and an equal weight in mohurs was returned, leaving to the Nepal rajahs, between gold dust and alloy, a good profit. The quality of these coins (weighing about 81 grains troy) was low, and at last deteriorated so much that the Tibetans deserted the Nepal mints. The Gurkhas, after becoming masters of Nepal, were anxious to renew the profitable traffic in coin, and in this view sent a deputation to Lhasa with a quantity of coin to be put in circulation. But the Gurkhas were mistrusted and their coin refused. A coinage was then issued (it would appear once only) in Tibet for domestic use, modelled on an old Kathmandu pattern and struck by Nepalese artists. The Gurkhas, however, in 1788 and following years continued to strike coins of progressively debased quality, which were rude imitations of the old Nepalese mintage, and to endeavour to force this currency on the Tibetans, eventually making the departure of the latter from old usage a pretext for war and invasion. This brought the intervention of the Chinese, who drove the Gurkhas out of Tibet (1792), and then began to strike silver coins for Lhasa use, bearing Chinese and Tibetan characters. For practical use these Tibeto-Chinese coins (of which $2\frac{1}{2} = 1$ rupee, and which are known as *naktang*, *i.e. nagskyang*, "cash") are cut into aliquot parts by the guidance of the figures on them. Large lumps of Chinese silver, stamped with the imperial seal, are also used. But of late years there has been an enormous influx of Anglo-Indian rupees, so that these have become practically the currency of the country, even to the frontier of China, and are now counted, instead of being valued as bullion. They are called *Piling tanka*, (foreign coins), from the Hindi *tankā*, a rupee.

Weights and Measures.—The weights and measures in use are practically those of China; the dry measures, the most commonly employed, are the *bre* or *bo* of about four pints and the *bchal* of twenty *bo*; the capacity of the *bo* varies according to localities. The most commonly used measures of length are the span (*mto*), the cubit (*kru*), and the arm's-length or fathom (*dompa*).

Exploration.—Tibet was long a *terra incognita* to Europeans. It is difficult of access on all sides, and everywhere difficult to traverse. Its great elevation causes the climate to be rather arctic than tropical, so that there is no gradual blending of the climates and physical conditions of India and Tibet, such as would tend to promote intercourse between the inhabitants of these neighbouring regions; on the contrary, there are sharp lines of demarcation, in a mountain barrier which is scalable at only a few points, and in the social aspects and conditions of life on either side. No great armies have ever crossed Tibet to invade India; even those of Jenghiz Khan took the circuitous route via Bokhara and Afghanistan, not the direct route from Mongolia across Tibet. Added to this was the religious exclusiveness of the Tibetans themselves. Thus it was no easy matter for the early European travellers to find their way into and explore Tibet. Friar Odoric of Pordenone is supposed to have reached Lhasa *c.* 1328, travelling from Cathay; but this visit is doubtful. On the strength of certain statements in the narrative of Fernão Mendes Pinto, some authorities hold that he may have visited Lhasa in the course of his journeys in the middle of the 16th century. The Jesuit Antonio Andrada, a native of Portugal (1580–1634), travelling from India, appears to have entered Tibet on the west, in the Manasarowar Lake region, and made his way across to Tangut and north-western China; in 1661 the Jesuit fathers Johann Grueber (an Austrian) and Albert D 'Orville (a Belgian) travelled from Peking via Tangut to Lhasa, and thence through Nepal to India. The extracts from Grueber's narrative, given by Athanasius Kircher in his *China illustrata* (Amsterdam, 1667), are accompanied by a good drawing of Potala. During the first half of the 18th century various Capuchin friars appear to have passed freely between Calcutta and Lhasa (1708) by way of Nepal. They even founded a mission in Lhasa, which, after failing at first, was more firmly established in 1715 and lasted till 1733.

In 1716 two Jesuits, P. Ipolito Desideri, of Pistoia, and P. Freyre, a Portuguese, reached Lhasa by way of Kashmir, Ladak, and the enormous journey from Ladak by the holy lakes and the valley of the Tsangpo. Desideri remained at Lhasa till April 1721, witnessing the capture of Lhasa successively by Dzungar and Chinese. Of the moderation of the latter, and their abstinence from all outrage or plunder, he speaks highly. His departure was due to controversies between the Jesuits and Capuchins at Rome, which caused an order to be issued for his retirement from Tibet. An interesting letter from him, dated the 10th of April, 1716, is printed in the *Lettres édifiantes*, rec. xv., and he left a large MS. volume of his observations. The next European visitor was Samuel Van de Putte, of Flushing, an LL.D. of Leiden, whose thirst for travel carried him through India to Lhasa (1730), where he is said to have resided a long time, to have acquired the language, and to have become intimate with some of the lamas. After travelling from Lhasa to Peking with a lama mission he returned, again by Lhasa, to India, and was an eyewitness of the sack of Delhi by Nadir Shah in 1737. Unhappily he ordered his papers to be burnt after his death, and the knowledge that such a traveller must have accumulated died with him. In 1745 the Capuchin mission finally collapsed after a revival had been attempted in 1741 by a party under Orazio della Penna, of which Cassiano Beligatti was chronicler. We possess some of the results collected by this mission in an excellent short treatise on Tibet by P. Orazio himself, as well as in the *Alphabetum Tibetanum* of the Augustine monk A. Georgi (Rome, 1762). Some fifty volumes, the relics of the mission library, were in 1847 recovered from Lhasa by Brian Hodgson, through the courtesy of the Dalai lama himself, and were transmitted as an offering to Pope Pius IX. The first Englishman to enter Tibet was George Bogle, a writer of the East India Company, in 1774, on an embassy from Warren Hastings to the Tashi lama of Shigatse. In 1783 Lieut. Samuel Turner was despatched on a mission similar to that of Bogle, and reached Shigatse. In 1811–1812 the first English visit to Lhasa occurred. The traveller was Thomas Manning, a Cambridge man of Caius College, who had been long devoted to Chinese studies, the "friend M." of Charles Lamb, from whom "Elia" professes to have got that translation of a Chinese MS. which furnished the dissertation on roast pig. After residing some years at Canton, Manning went to Calcutta, bent on reaching the interior of China through Tibet, since from the seaboard it was sealed. He actually did reach Lhasa, stayed there about five months, and had several interviews with the Dalai lama, but was compelled to return to India. He never published anything regarding his journey, and its occurrence was known to few, when his narrative was printed, through the zeal of Mr (afterwards Sir) C. Markham, in 1876. The account, though containing some passages of great interest, is disappointing. Manning was the only Englishman known to have reached the sacred city without the aid of an army. But the Abbé Huc states that William Moorcroft, an Englishman who made a journey into Tibet in the neighbourhood of Lake Manasarowar in 1812, and another into Kashgar in 1824, lived in Lhasa for twelve years disguised as a Mussulman. He was supposed to have died on the Afghan frontier in 1825 on his second journey; but if Huc's story is true he reached Lhasa in 1826, and did not leave it till 1838, being assassinated on his homeward journey, when maps and drawings were found on him, and his identity was for the first time suspected by the Tibetans. During the 19th century Europeans were systematically prevented from entering the country or speedily expelled if found in it. In 1844–1846 the French missionaries, Evariste Régis Huc and Joseph Gabet, made their way to Lhasa from China. They travelled from China the route followed by Grueber and by Van de Putte, via Siningfu, and reached Lhasa on the 29th of January 1846. On the 15th of March they were sent off under escort by the rugged road to Szechuen. Huc's book, *Souvenirs d'un voyage*, &c., is one of the most delightful books of travel. Huc was, indeed, not only without science, perhaps without accurate knowledge of any kind, but also without that geographical sense which sometimes enables a traveller to bring back valuable contributions to geographical knowledge though unable to make instrumental observations. He was, however, amazingly clever as a narrator and sketcher of character. It was Ke-shen, a well-known Chinese statesman, who was disgraced for making peace with the English at Canton in 1841, and was then on a special deputation to Lhasa, who ostensibly expelled them. The Tibetan regent, with his enlightened and kindly spirit, is painted by Huc in most attractive colours, and Markham expressed the opinion that the native authorities were then willing to receive strangers, while the jealousy that excluded them was Chinese only. The brothers Henry and Richard Strachey visited Manasarowar Lake in 1846 and 1848 respectively. In 1866 the Abbé Desgodins travelled through portions of eastern Tibet and reached Chiamdo (in Khām), but was prevented from approaching any closer to Lhasa.

The Secret-Service Pundits.

Beginning in 1863 a number of native Indian explorers were sent by the government of India into Tibet, for the purpose of surveying the country and collecting information about its inhabitants. These men were specially trained at Dehra Dun in the work of surveying, and entered Tibet with a strong wooden box with a specially concealed secret drawer for holding observing instruments, a prayer wheel with rolls of blank paper instead of prayers in the barrel on which observations might be noted, and lamaic rosaries by the beads of which each hundred paces might be counted. As may be imagined, they carried their lives in their hands in case of discovery. The best known of these men were Pundit Nain Singh, Pundit Krishna, originally known as A.-K. (from the first and last letters of his name transposed) and Ugyen Gyatso, or U.-G. Nain Singh reached Lhasa in the course of two remarkable journeys. In the first, after an ineffectual attempt by Nepal, he travelled by the Manasarowar Lake, and the road thence eastward, parallel to the course of the Tsangpo, reaching Lhasa on the 10th of January 1866, and leaving it on the 21st of April 1867. On the second journey (1874) he started from Ladak, crossing the vast and elevated plateau by the Tengri Nor and other great lakes, and again reaching Lhasa on the 18th of November. Nain Singh gave an account of his journeys, and of his residence there, which, though brief, is full of intelligence and interest. This enterprising and deserving man, on the completion of his journey in 1875, was rewarded by the Indian government with a pension and grant of land, and afterwards received the gold medal of the Royal Geographical Society and the Companionship of the Star of India. He died early in 1882.

In 1878 A.-K also revisited Lhasa, stayed a year, and afterwards continued into Tsaidam, not returning to India till 1882. Lama Ugyen Gyatso, a semi-Tibetan, who was originally a teacher of Tibetan in a Darjeeling school, was trained by the Indian Survey Department as a surveyor, and being deputed to take tribute from his monastery to Tashilhunpo, he secured permission in 1879 from the Tashilhunpo authorities for Sarat Chandra Das, Bengali schoolmaster at Darjeeling, to visit that monastery, where his name was entered as a student. This was the opportunity for a series of valuable exploratory journeys through the Tibetan provinces adjoining the Indian and Nepalese frontiers, which added greatly to our stock of information about Lhasa and the districts surrounding that city. In their first journey the travellers set out from Jongri in Sikkim, and traversing the north-east corner of Nepal, crossed into Tibet by the Chatang la, and travelled northwards to Shigatse and Tashilhunpo. They returned by much the same way to near Khamba jong, and re-entered Sikkim by the Donkya pass. The journey was fruitful of information and valuable for mapping. Ugyen Gyatso undertook another journey in 1883 to complete and extend his former surveys. Travelling by way of Khamba jong directly to Gyantse and Shigatse, he turned eastwards at the latter town, finished the survey of the Yamdok t'so, and crossed the Himalaya into the valley of the Lobratsangpo or Upper Manas river. At Shakhang jong he was arrested, and his true character discovered. He managed, nevertheless, to extricate himself, and turning north-eastwards he passed through Chetang, and reached Lhasa by way of Samye monastery. From this city he started for Darjeeling, which he reached on December 15th, 1883. Chandra Das made a second journey in 1881, with the intention of reaching Lhasa. He travelled by way of Tashilhunpo, lay dangerously ill for some time at Samding monastery, duly reached Lhasa, where he visited the Dalai Lama, but owing to small-pox in the city could remain there only a fortnight, though he made full use of this time. During a journey home occupying nearly half a year he collected much further valuable information. Sarat Chandra Das's reports of his two journeys were published by the Indian government, but for political reasons were until 1890 kept strictly confidential. In 1899 they were edited by the Royal Geographical Society and in 1902 published. They contain valuable information on the superstitions, ethnology and religion of Tibet. Chandra Das also brought back from his journeys a large number of interesting books in Tibetan and Sanskrit, the most valuable of which have been edited and published by him, some with the assistance of Ugyen Gyatso and other lamas.

Russian Explorers.

The Russian explorer Prjevalsky, although he was not, strictly speaking, an explorer of Tibet, did much incidentally towards determining the conformation of its north-eastern and eastern mountain systems. His third journey into Central Asian wilds, which lasted from March 1879 to October 1880, included the sources of the Hwang Ho, or Yellow river, till then unmapped and unknown. His fourth journey, between November 1883 and October 1885, covered much of northern Tibet, and established the true character of Tsaidam. It was when setting out in 1888 to make an attempt to reach Lhasa that he died.

After Prjevalsky's death, V. I. Roborovski, with several companions, explored the western ranges of the Kuen-lun, and crossed southwards into Tibet, tracing the course of the Kiria river to the north-western plains of the central plateau. The distinguishing feature of these explorations, led by Russian officers, is their high scientific value and the contributions they have offered to the botany, natural history, geology and meteorology of the regions under investigation in addition to the actual geographical data attained. The Kuen-lun is known in their writings as the Russian Range.

W. W. Rockhill, 1888–1889, 1891–1892.

In 1888 Mr W. W. Rockhill, an American possessing the unique qualifications for Tibetan exploration of a profound knowledge of the language and history of the country, coupled with the instincts and training of a scientific explorer, left the lamasery of Kumbum in north-western Kansuh with three Chinese servants and a small caravan, proceeded round the north shore of Koko Nor, crossed eastern Tsaidam, and explored some of the rivers and lakes directly south of that region. Leaving Barong Tsaidam, he travelled south by way of the sources of the Yellow river, till he reached the Dre chu (upper Yangtsze-kiang), which he crossed to the north of the important trading centre of Yekundo. From this point he followed the valley of the Dre chu till about lat. 30° 31′, when he passed into the basin of the Yalung river, traversed the Horba states and finally reached Tachienlu by the Gi la and the valley of the Darchu.

In 1891 Mr Rockhill, starting again from Kumbum with three Chinese, passed south of Koko Nor through the country of the pastoral Panaka Tibetans, and by a very difficult pass (Vahon jamkar la) entered again the basin of the Tsaidam. He then turned west, followed the base of the south Tsaidam range as far as the Naichi Gol, where he entered the southern mountainous region forming the northern borderland of Tibet. From this point the traveller followed a general south-westerly direction around the heads of all the feeders of the upper Dre chu, and thence into the lake region of northern central Tibet, crossing Bonvalot's route south of the Chi-chang t'so and that of Bower a few days farther south. Near the Namru t'so his farther progress south was arrested and he was compelled to take an easterly course. After making a long détour north, often crossing the roads previously travelled by Bonvalot and Bower, and passing by Riwoche, he came to Chiamdo and Tachienlu. The results of Mr Rockhill's two journeys were important and valuable.

A. D. Carey and A. Dalgleish, 1885–1887.

Messrs A. D. Carey and A. Dalgleish in 1885–1887 made a protracted journey from Ladak, in the course of which they crossed the Aksai Chin, reached Khotan, entered the Tarim basin, and subsequently made their way eastward and then southward across the Altyn Tagh and other ranges to the Tsaidam region. Finally a great circuit was made to the north and west, across the Humboldt range, and by Hami, Urumchi, and Yarkand to Ladak again.

Gabriel Bonvalot, 1889–1890.

Bonvalot, accompanied by Father Dedeken of the Belgian Catholic Mission and Prince Henri d'Orléans, left Charkhlik, south-west of the Lob Nor, in November 1889, and taking a very nearly due southerly course, reached on the 13th of February 1890 the eastern end of the Tengri Nor. Then pushing on southwards, he crossed the Nien-chen-tang-la and entered the Dam district near the Lhasa-Sining high road. Here the party was stopped by Tibetan authorities and forced to take the tea route through Chinese Tibet (Gyade) by way of Batasumdo, Chebotenchin, Riwoche, Chiamdo to Chiangka, near the upper Yangtse-kiang, whence they proceeded to Tachienlu by Batang and Litang. Bonvalot noted some extinct volcanoes in the northern Tibet desert.

Captain H. Bower, 1891–1892.

Accompanied by Dr W. G. Thorold, of the India Medical Service, and a native sub-surveyor, Captain Hamilton Bower, I.S.C., set out from Leh on the 1st of June 1891, and crossed the Lanak la and the Ladak frontier on the 3rd of July. From this point the party took a general easterly direction past the Mangtza t'so, Horpa t'so, Charol t'so, and around the northern end of the Aru t'so, all important lakes, at an average altitude of about 16,500 ft. From the Aru t'so the travellers took a south-easterly direction across the great northern plateau or Changtang till they reached the south-east side of the Garing t'so, in about 31° 30′ N. and 89° 10′ E. At this point Bower was stopped by some of the headmen of the Tibetan pastoral tribes (here under the rule of Lhasa), and obliged to make a long circuit to the north well out of Lhasa territory, and then eastward—till he struck the road to Chiamdo through Gyade or Chinese Tibet. Crossing the Sining-Lhasa road a little south of the Dang la range, and about two days' journey north of Nagchuka, Captain Bower crossed the Su chu, and following a course parallel to the Giama-nu chu, he made his way to Riwoche and thence to Chiamdo, from which town he followed the Lhasa-Tachienlu high road to the latter town, which he reached on the 10th of February 1892. The results of Captain Bower's journey were all of first-class importance.

Miss A. R. Taylor, 1892.

Miss Annie R. Taylor, an Englishwoman of the China Inland Mission, started from Tao-chow (Kansuh) in September 1892, accompanied only by five Asiatics. Passing by the famous lamasery of Labrang, south of the Yellow river, she crossed that river and traversed the southern part of the country inhabited by the predatory Tibetan tribes called Golok. Thence, after crossing the upper Yalung, which flows by the town of Kanze, she pursued her journey to the upper course of the Yangtse-kiang (Dre chu), crossing that river somewhere near where A.-K. had crossed it in 1881 and Rockhill in 1889, and then came to the town of Gye-Yekundo. From this point she seems to have followed the Chiamdo road to near that town, when she turned westwards and continued in that direction till she came on the high road from Lhasa to Sining Fu somewhere north of Nagchuka. Here, like all other European travellers who have tried to reach Lhasa from the north, she was stopped by the Lhasan authorities. She appears to have followed about the same route on her way back to China, for she again went to Yekundo and thence by the high road, followed previously by A.-K. and Rockhill, to Tachienlu in Sze-ch'uen, where she arrived on the 12th of April 1893.

Dutreuil de Rhins and F. Grenard, 1893-1894.

In 1893 MM J. L. Dutreuil de Rhins and Fernand Grenard, both Frenchmen, left Cherchen, with Lhasa as their objective. After crossing the Kara muren davan in the Arka Tagh, they entered the lake region of north Tibet and followed a general southerly direction across low ranges of hills and by numerous small lakes till they arrived in 32° 30′ N., where they changed direction to east-south-east, passing to the north of the Chargut and Zilling lakes. The travellers were able to push on as far as the north-eastern bank of the great Tengri Nor, which they reached on the 30th of November 1893. Here they were finally stopped by the Tibetans, and after a delay of six weeks passed in vain attempts to obtain permission to go to Lhasa, they were only allowed to proceed to Nagchuka on the Sining-Lhasa road, and to continue by the Gyade route to Yekundo, near the upper Dre chu, and thence to Sining in Kansuh. From Nagchuka the travellers followed a heretofore unexplored road through the Gyade country, crossing Rockhill's route in the Pere-Sangyi districts near Tashiling (their Tachi gomba). The road followed by them to Yekundo is called by Tibetans the upper road (*gong lam*), and had apparently been followed previously by Miss Taylor. Reaching Yekundo (or Giergundo) on the 21st of May 1894, the travellers started for the Koko Nor and Sining on the 1st of June; but the party was attacked near Tungbumdo (Tumbumdo of previous travellers), and Dutreuil de Rhins was killed on the 5th of June. M Grenard after a few days resumed his march, passed east of the Noring t'so, the eastern extremity of Tosu Nor, and thence by the south-east corner of Koko Nor to the town of Sining Fu in Kansuh. The results of this exploration were a large number of maps and a report of great scientific importance.

St George R. Littledale, 1895.

Mr Littledale, an Englishman, accompanied by his wife, left Khotan in the early part of 1895, and travelling thence to Cherchen, he turned southwards, and following up the course of the Cherchen darya to a point near its source, he continued in that direction between 87° and 89° E. across the northern plateau of Tibet till he reached the Zilling (or Garing) t'so. Pursuing, amid great difficulties, his southerly course, he finally reached the western bank of Tengri Nor. Pushing rapidly on in the direction of Lhasa, when not over 50 m. away from the city (camp, 30° 12′ 12″ N.) he was finally stopped by the Lhasan authorities and obliged, in great part on account of the severe illness of Mrs Littledale, to give up the attempt to reach Sikkim, and to take a direct trail to Ladak. In the latter part of this remarkable journey Littledale's route lay parallel but to the south of the routes followed previously by Nain Sing, and more recently by Bower. Passing by Rudok, the party re-entered Ladak at the village of Shushal on the 27th of October 1895, and Leh on the 2nd of November. Mr Littledale surveyed about 1700 m. of country between Cherchen and Shushal, and brought back a valuable collection of plants, which, added to those collected by other travellers in this part of Tibet, enabled botanists considerably to extend their scanty knowledge of this region.

Captain M. S. Wellby, 1896.

Accompanied by Lieut. N. Malcolm of the 93rd Highlanders, Captain Wellby, of the British army, left Leh on the 4th of May 1896. The travellers were compelled to enter Tibet by way of the Lighten t'so in 35° N. From this point they turned due east and continued, with the usual incidents experienced by all travellers in those regions—cold, storms, lack of food and of grass, loss of ponies and pack animals, &c.—until they reached the northern branch of the Dre chu, the Chumar. Passing into the valley of the Nomoron Gol, south of the Tsaidam, they made their way by Barong Tsaidam to Donkyr and Sining Fu by the high road along the northern shore of the Koko Nor.

Captain H. H. P. Deasy, 1896.

Captain Deasy, of the British army, left Leh on the 27th of May 1896, and crossing the Lanak la, passed by the Mangtza t'so, north of the Horpa t'so, to Yeshil kul. Thence he endeavoured to proceed due east, but was obliged by the nature of the country to turn south, crossing Bower's route on the west side of the Aru t'so. He finally completed a valuable survey of an important part of western Tibet.

Rijnhart, 1898.

In 1898 a Dutch missionary in China named Rijnhart started with his wife from the vicinity of Koko Nor, with the intention of reaching Lhasa, but at the upper Mekong, to the east-north-east of the city, he was murdered, and his wife reached the Chinese province of Sze-ch'uen with great difficulty alone.

Sven Hedin, 1896-1908.

In 1896 Sven Hedin, a Swede (1865–   ), left Kopa, a point about 100 m. south of Cherchen, and after crossing the Arka Tagh took an easterly course between that range and the western continuation of the Kokoshili range till he entered the valley of the most northerly feeders of the Dre chu, when he passed into the valley of the Naichi Gol and entered the Tsaidam. His careful observations concerning the meteorology of this region are of great value, and his surveys between Kopa and the Naichi Gol were in a country not previously explored. During his second and more important journey in Central Asia (1899–1902), Sven Hedin left Charkhlik, on the edge of the Taklamakan desert, in May 1901, intending to cross Tibet in a diagonal direction to the sources of the Indus. He made crossings of the lofty Arka Tagh and other parallel ranges to the south (running east and west). On his final penetration southward, arriving within fourteen days of Lhasa, he left the bulk of his caravan and pushed rapidly on towards that city, but was stopped when about five days from it (Aug. 5, 1901). Rejoining his caravan he turned westward, and passing through the country previously traversed by Bower and Littledale he reached Leh on the 20th of December 1901. His careful and detailed maps, lake soundings, hydrographic, geological, meteorological and other investigations gave him the highest rank among modern explorers.

On a third journey (1906–1908) he travelled by way of Turkish Armenia, Persia, Baluchistan and India, and entered Tibet by way of the Aksai Chin. Proceeding south-east, or diagonally across the country, he traversed 840 m. of unknown country, investigating the lake Ngangon t'so or Ngantse t'so, which had hitherto been only hypothetically mapped, and marched thence over the watershed between this and the Tsangpo. This watershed was found to lie much farther north than had been supposed, and to consist of very lofty mountains, in complicated ranges, from which large tributaries descend to the Tsangpo (Brahmaputra). After a journey of half a year Hedin reached Shigatse; on leaving it he turned north again, intending to explore the large sacred lake Dangra-yumso, west of Ngantse t'so, but when within sight of it he was prevented by Tibetans from approaching it. He now followed a devious route to Lake Manasarowar, entering Nepal for a short distance from Tradum, discovering the main source of the Brahmaputra in a great mass of glaciers called Kubi-gangri, in the northernmost chain of the Himalaya. He next investigated the sources of the Sutlej, made hydrographic investigations of the Manasarowar lakes, with the neighbouring underground waterways, and proceeded thence to Gartok. He confirmed the existence, long suspected, of a lofty mountain chain extending right across the country from the lake Tengri Nor (*i.e.* about 90° E.) to the district north of Gartok (about 81° E.). He returned to Ladak in 1908. He was created a K.C.I.E. in 1910.

Captain P. K. Kozlov, 1900-1901.

In May 1900 Kozlov, in command of the Russian Geographical Society's expedition to Central Asia and Tibet, left Barong Tsaidam, and travelling southwards, came to the Dre chu (his Ndu chu, or Blue river), at about the same point as Rockhill in 1889. Assisted by the old chief of Nyamtso, he crossed the river and reached Yekundo (his Jarku Lomba). One stage beyond this place he left the route followed by former travellers and pushed northwards to near the town of Chiamdo, where after a sharp fight with the natives he turned eastwards. The winter was passed in the valley of the Ra chu, a tributary of the Chiamdo chu (his Dza chu), and excursions were made as far as Derge droncher. In the spring of 1901 the expedition resumed its march eastwards around the Dre chu and the Ja chu (Yalung river), followed up the left bank of the latter and got back to Russian Lelu (Oring t'so) on the 30th of May 1901.

Captain C. G. Rawling, 1903.

In 1903 Captain C. G. Rawling and Lieut. A. J. G. Hargreaves of the Somerset Light Infantry, starting from Leh as a base, carried out careful survey work (their chief object being to extend that of Captain Deasy) in the territory lying east of the British frontier, *i.e.* about 80° to 83° E., and 34° N.

The British armed mission of 1904 performed a brilliant feat of marching and reached Lhasa, whose mysteries were thus unveiled, but this exploit belongs to the section dealing with history, below. (T. H. H.*; L. A. W.; O. J. R. H.)

History.—Previous to the 7th century A.D. there was no indigenous recorded history of the country, the people being steeped in barbarism and devoid of any written language. The little that is known of this prehistoric period is gathered from the legends and the more trustworthy sidelights of contemporary Chinese records.

From the 11th century B.C. the Chinese used to call by the name of Kiang (or Shepherds) the tribes (about 150 in number) of nomads and shepherds in Koko Nor and the north-east of present Tibet; but their knowledge continued to be confined to the border tribes until the sixth century of our era. In the annals of the T'ang dynasty it is said that the population of the country originated from the Bat-Kian or Fah Kiang; and, as the information collected in the first part of the notice concerning Tu-bat, afterwards Tu-ban, the modern Tu-fan, dates partly (as is proved by internal evidence) from a time anterior to the T'ang dynasty (A.D. 618), some degree of reliance may be placed on it. There we are told that Fanni, a scion of the southern Liang dynasty of the Tu-bat family (which flourished from 397 to 415 at Lian-chow in Kansuh), who had submitted to the northern Liang dynasty, fled in 433 with all his people from his governorship of Lin-sung (in Kan-chow) westwards across the Yellow river, and founded beyond Tsih-shih ("heapy stones") a state amidst the Kiang tribes, with a territory extending over a thousand *li*. By his mild and just rule he was soon enabled to establish his sway over an immense territory. His original state was apparently situated along the upper course of the Yalung river, an affluent of the Kin-sha-kiang.

Through the exertions of Prinsep, Csoma de Körös, Emil Schlagintweit, Chandra Das, Rockhill, Huth, Waddell and others, we possess many copies of lists of kings, forming the dynasties of Tibet from the legendary beginnings between the 5th and 2nd century B.C. down to the end of the monarchy in 914. But the serious divergences which they show (except as to later times and in general outlines) make their unauthentic character plain. As one of the lists is accompanied by a commentary, it is the easiest to follow, and requires only to be supplemented here and there from the other lists and from the Chinese sources, translated by Bushell and Rockhill. The first king, Gnya-khri btsan-po, is said to have been the fifth son of King Prasenajit of Kosala, and was born with obliquely drawn eyes. He fled north of the Himalayas into the Bod country, where he was elected king by the twelve chiefs of the tribes of southern and central Tibet. He took up his residence in the Yarlung country south of Lhasa. This Yarlung, which borrowed its name from the Yalung of the state of Fanni Tu-bat, is a river which flows into the Yaro-tsangpo (Brahmaputra). The first king and his six successors are known as the seven celestial *khri*; the next series consists of six kings known as the earthly *legs*; and they were followed by eight terrestrial *ldé*. This threefold succession is apparently an imitation or a debased form of the ancient legend of heavenly, earthly and human rulers, which was carried into Persia and China, and from the latter country into Japan and Tibet—the relative number of kings being altered in the last-named countries to suit local convenience and the small amount of truth which they contain. Whilst giving an Aryan descent to their first kings, the ancient Tibetans assigned to their princesses a divine origin, and called them *lhamo*, "goddess." The gynaecratic habits of the race are manifested in the names of all these kings, which were formed by a combination of those of their parents, the mother's generally preceding that of the father. The *ldé* kings were followed by four rulers simply called *btsan* ("mighty").

Then occurs a break in the lineal descent, and the king next in order (*c.* 461) may be the Tatar Fanni Tu-bat, but most probably his son and successor. His name was Lha-tho thori gnyan-tsan, otherwise Gnyan-tsan of Lha-tho thori, according to the custom usual in Tibet of calling great personages after the name of their birthplace. Lha-tho means "heaps of stones," and therefore appears to be a translation of Tsih-shih, "heapy stones," the country mentioned in connexion with the foundation of a state by Fanni Tu-bat. It was during his reign that the first Buddhist objects are reputed to have reached Tibet, probably from Nepal. Little is said of his three immediate successors. The fourth was gNam-ri srong btsan, who died in 630. During his reign the Tibetans obtained their first knowledge of arithmetic and medicine from China; the prosperity and pastoral wealth of the country were so great that "the king built his palace with cement moistened with the milk of the cow and the yak." To the same king is attributed the discovery of the inexhaustible salt mine called Chang-gi-tsa'wa (Byang-gi-tsa'wa = "northern salt"), which still supplies the greater portion of Tibet. The reign of his illustrious son, Srong tsan gam-po, opened up a new era; he introduced Buddhism and the art of writing from India, and was the founder (in 639) of Lha-ldan, afterwards Lha-sa. He was greatly helped in his proselytism by his two wives, one a Nepal princess, daughter of King Jyoti varma, the other an imperial daughter of China; afterwards, they being childless, he took two more princesses from the Ru-yong (= "left corner" ō) and Mōn (general appellative for the nations between Tibet and the Indian plains) countries. As a conqueror he extended his sway from the still unsubdued Kiang tribes of the north to Ladak in the west, and in the south he carried his power through Nepal to the Indian side of the Himalayas. How far southward this dominion at first extended is not known; but in 703 Nepal and the country of the Brahmans rebelled, and the Tibetan king, the third successor of Srong tsan gam-po, was killed while attempting to restore his power. It is rather curious that nothing is said of this Tibetan rule in India, except in the Chinese annals, where it is mentioned until the end of the monarchy in the 10th century, as extending over Bengal to the sea—the Bay of Bengal being called the Tibetan Sea. J. R. Logan has found ethnological and linguistic evidence of this domination, which was left unnoticed in the Indian histories. Mang-srong mang tsan, the second son and successor of Srong tsan gam-po, continuing the conquests of his father, subdued the Tukuhun Tatars around the Koko-Nor in 663, and attacked the Chinese; after some adverse fortune the latter took their revenge and penetrated as far as Lhasa, where they burnt the royal palace (Yumbu-lagang). Khri lde gtsug-brtan-mesag-ts'oms, the grandson of Mang-srong and second in succession from him, promoted the spread of Buddhism and obtained for his son, Jangts'a Lhapon, who was famous for the beauty of his person, the hand of the accomplished princess Kyimshang, daughter, otherwise *kung-chu*, of the Chinese emperor Juy- (? Tai) tsung. But the lady arrived after the death of her betrothed, and after long hesitation became the bride of the father. She gave birth in 730 to Khri srong lde tsan, in the Buddhist annals the most illustrious monarch of his country, because of the strenuous efforts he made in favour of that religion during his reign of forty-six years (743–789). His son and successor Muni tsan-po, being determined to raise all his subjects to the same level, enacted that there should be no distinction between poor and rich, humble and great. He compelled the wealthy to share their riches with the indigent and helpless and to make them their equals in respect of all the comforts and conditions of life. He repeated this experiment three times; but each time he found that they all returned to their former condition, the rich becoming still richer and the poor still poorer. The sages attributed this curious phenomenon to the good and evil acts of their former lives. Nothing of importance occurred during the following reigns, until that of Ralpachen, who won glory by his care for the translations of the Buddhist scriptures which he caused to be completed, or rewritten more accurately when required. In this reign a severe struggle took place with China, peace being concluded in 821 at Ch'ang-ngan and ratified at Lhasa the following year by the erection of bilingual tablets, which still exist. Ralpachen was assassinated by the partisans of Lang-dharma and the country fell into disorder. Lang-dharma instituted a violent persecution of Buddhism; but he was soon assassinated in his turn and the kingdom divided into a western and an eastern part by his two sons. The partition did not, however, prevent internecine wars. The history for some time now becomes rather intricate and requires some attention. Pal K'or tsan, the second western king, after a reign of thirteen years, died leaving two sons, Thi Tashi Tsegpa-pal and Thi Kyida Nyimagon. The latter went to Nari (Mngari) and founded the capital Purang; he left three sons, of whom the eldest declared himself king of Mang-yul, the second seized Purang, and the youngest, Detsud-gan, became king of the province of Shang-shung (the modern Gughè). The revival of Buddhism began with the two sons of the last-named, the elder of whom became a monk. The younger, Khorré, inherited his father's throne, and was followed in his authority by twenty successors. Tashi Tsegpa also had three sons—Palde, Hodde and Kyide. The descendants of the first made themselves masters of Gung-t'ang, Lugyalwa, Chyipa, Lhatse, Langlung and Tsakor, where they severally ruled as petty chiefs. The descendants of Kyide spread themselves over the Mu, Jang, Tanag, Yarulag and Gyaltse districts, where they also ruled as petty princes. Hodde left four sons—Phabdese, Thide, Thich-ung and Gnagpa. The first and fourth became masters of Tsan-grong, the second took possession of Amdo and Tsongkha, the third became king of Ü (or the central Lhassan province), and removed the capital to Yarlung, south of Lhasa. He was followed on his throne from son to son by eleven successors. History is silent as to the fate of the eastern king, the other son of Lang-dharma, and his successors, but the geographical names of the chieftainships enumerated above make it clear that the western kingdom had extended its power to the east. Chronology is deficient for all that period. While the dynasty of Khorré in Shang-shung and that of Thich'ung in Ü were running, another authority, destined to become the superior of both, had arisen in Tibet. Khorré left his throne to his son Lhade, who was himself succeeded by his three sons, the youngest of whom invited the celebrated Indian Buddhist, Atisha, to leave his monastery Vikramashila for Tibet, where he settled in the great lamaserai of Thoding in Nari. Besides religious books and teachings, he introduced in 1026 the method of computing time by cycles of sixty years, "obtained from the Indian province of Shambala." He was the first of the several chief priests whose authority became paramount in the country. The kings of Ü greatly patronized them, as for instance in the case of the celebrated Sakya Pandita by the seventh of these kings. Pandita, at the special request of Kuyuk, the successor of Ogdai, paid a visit to his court in 1246–1248. Five years afterwards Kublai Khan conquered all the east of Tibet; and, after he had ascended the throne of China, the Mongol emperor invited to his court Phagspa Lodoi Gyaltshan, the nephew of the same Pandita. He remained twelve years with the emperor, and at his request framed for the Mongol language an alphabet imitated from the Tibetan, which, however, did not prove satisfactory, and disappeared after eighty-five years without having been very largely used. In return for his services, Kublai invested Phagspa with sovereign power over (1) Tibet proper, comprising the thirteen districts of Ü and Tsang, (2) Khám and (3) Amdo. From this time the Sakya-pa lamas became the universal rulers of Tibet, and remained so, at least nominally, under twenty-one successive lamas during seventy years (1270–1340). Their name was derived from the Sakya monastery, which was their cradle and abode, and their authority for temporal matters was exercised by specially appointed regents. When the power of the Sakya began to wane, that of the rival monasteries of Digung, Phagdub and Tshal increased largely, and their respective influence and authority overbalanced that of the successors of Phagspa. It was at this troubled epoch that Chyang Chub Gyaltshan, better known as Phagmodu from the name of his native town, appeared on the scene. He subdued Tibet proper and Khám, for the continued possession of which he was, however, compelled to fight for several years; but he succeeded in the long run, and with the approval of the court of Peking established a dynasty which furnished twelve rulers in succession. When the Mongol dynasty of China passed away, the Mings confirmed and enlarged the dominion of the Tibetan rulers, recognizing at the same time the chief lamas of the eight principal monasteries of the country. Peace and prosperity gradually weakened the benign rule of the kings of this dynasty, and during the reign of the last but one internecine war was rife between the chiefs and nobles of Ü and Tsang. This state of things, occurring just as the last rulers of the Ming dynasty of China were struggling against the encroachments of the Manchus, their future successors, favoured the interference of a Khoshot Mongol prince, Tengir To, called in the Tibetan sources king of Koko Nor. The Mongols were interested in the religion of the lamas, especially since 1576, when Altan, khakan of the Tumeds, and his cousin summoned the chief lama of the most important monastery to visit him. This lama was Sodnam rGyamtso, the third successor of Gedundub, the founder of the Tashilhunpo monastery in 1447, who had been elected to the more important abbotship of Galdan near Lhasa, and was thus the first of the great, afterwards Dalai, lamas. The immediate successor of Gedundub, who ruled from 1475 to 1541, had appointed a special officer styled *depa* to control the civil administration of the country. To Sodnam rGyamtso the Mongol khans gave the title of Vajra Dalai Lama in 1576, and this is the first use of the widely known title of Dalai Lama. During the minority of the fifth (really the third) Dalai Lama, when the Mongol king Tengir To, under the pretext of supporting the religion, intervened in the affairs of the country, the Pan-ch'en Lo-sang Ch'o-kyi Gyal-ts'ang lama obtained the withdrawal of the invaders by the payment of a heavy war indemnity, and then applied for help to the first Manchu emperor of China, who had just ascended the throne. This step enraged the Mongols, and caused the advance of Gushri Khan, son and successor of Tengir To, who invaded Tibet, dethroned all the petty princes, including the king of Tsang, and, after having subjugated the whole of the country, made the fifth Dalai lama supreme monarch of all Tibet, in 1645. The Chinese government in 1653 confirmed the Dalai Lama in his authority, and he paid a visit to the emperor at Peking. The Mongol Khoshotes in 1706 and the Sungars in 1717 interfered again in the succession of the Dalai lama, but the Chinese army finally conquered the country in 1720, and the present system of government was established. It is probable that the isolation of Tibet was inspired originally by the Chinese, with the idea of creating a buffer state against European aggression from this direction.

Modern British and Russian Relations.

In 1872–1873 some attempt was made by Indian officials to open up trade with Tibet; further attempts followed in 1884, and in 1886 a mission was organized to proceed to Lhasa. The Chinese, however, although they had at first granted a passport to this mission, later objected to its advance, and it was abandoned. The Tibetans assumed this to show England's weakness; they invaded Sikkim, and in 1888 it was necessary to send a force under General Graham to expel them. In 1890 a treaty was concluded, and trade regulations under this treaty in 1893; but the negotiations were carried on with the Chinese authorities, and the lamas, considering themselves to have received insufficient recognition, repudiated them and offered further insults. A new development presently appeared in the situation. A lama, a Mongolian Buriat by birth and a Russian subject, whose Russianized name was Dorjiev, had come to Lhasa about 1880. When subsequently visiting Russia, he appears to have drawn the attention of the authorities towards Tibet as a field for their statecraft, and he established himself as the unofficial representative of Russia in Lhasa. He obtained a commanding influence over the Dalai Lama, impressed upon him the dangers which threatened Tibet from England, and suggested the desirability of securing Russian protection and even the possibility of converting the tsar and his empire to Buddhism. The Dalai Lama assented, and was even prepared to visit St Petersburg, but was checked by the Tsong-du (assembly). He therefore sent a representative of high rank, who had audience of the tsar, and returned with proposals for a treaty and for the residence of a Russian royal prince in Lhasa in order to promote friendly relations. But both the Chinese authorities in Lhasa and the Tsong-du were averse from any such proceedings. The Dalai Lama, inspired by Dorjiev, now took steps to bring on a crisis by provoking England. He felt sure of Russian support. Russian arms had been imported into Lhasa. It was suspected, although denied, that a treaty was in draft under which Russia should assume the suzerainty of Tibet. A further encroachment on

British territory in Sikkim was made by Tibetans, and various other slights were offered.

The viceroy of India, Lord Curzon, now decided that strong action was necessary; but the home government at first assented only to the despatch of Colonel (afterwards Sir) F. E. Younghusband with a small escort to negotiate at Khambajong, to the north of the Sikkim frontier. The mission arrived at this point on the 7th of July 1903, and here it remained till the 11th of December. No responsible Tibetan representatives appeared, and such negotiations as were carried on were abortive. On the 3rd of October, therefore, the British government authorized the occupation of the Chumbi valley, and an advance to Gyantse in Tibet and military preparations, with the difficult attendant problem of transport, were undertaken. Colonel Younghusband again accompanied the mission, and the troops were commanded by General Ronald Macdonald. The Jelep pass was crossed and the entry into Tibet effected on the 12th of December. An advance was made to Tuna, where part of the expedition wintered. A further advance being made on the 31st of March 1904, the first hostile encounter took place at Guru, when the Tibetans (the aggressors) were defeated. With some further fighting *en route* the expedition reached and occupied Gyantse on the 12th of April; here some of the British forces were subsequently beleaguered, and the most serious fighting took place. In fact the advance to Lhasa, resumed after the storming of the Gyantse *jong* (fort) on the 6th of July, met with comparatively little opposition, and the capital was reached on the 3rd of August. The Dalai Lama had fled with Dorjiev. Partly on this account, and in spite of the attempts of the Chinese authorities to bring about a settlement, there was some delay owing to the attitude of the lamas, but finally a treaty of peace was concluded on the 7th of September. The principal provisions were—the Sikkim frontier violated by the Tibetans was to be respected; marts were to be established for British trade at Gyantse, Gartok and Yatung; Tibet was to pay an indemnity of £500,000 (subsequently reduced to one-third of this sum); and no foreign power was to receive any concession in Tibet, territorial or mercantile, or to concern itself with the government of the country. The expedition left Lhasa on the 23rd of September and reached India again at the close of the following month. The treaty was slightly modified later in matters of detail, while the adhesion of China to the treaty was secured by an agreement of the 27th of April 1906.

British Armed Mission, 1904.

The Anglo-Russian convention of 1907 determined the following conditions with respect to Tibet—the recognition of the suzerain rights of China and the territorial and administrative integrity of the country; that no official representative at Lhasa should be appointed either by England or by Russia, and that no concessions for railways, mines, &c., should be sought by either power. An annex to the convention provided that, except by arrangement between England and Russia, no scientific expedition should be allowed to enter the country for three years.

In January 1908 the final instalment of the Tibetan indemnity was paid to Great Britain, and the Chumbi valley was evacuated. The Dalai Lama was now summoned to Peking, where he obtained the imperial authority to resume his administration in place of the provisional governors appointed as a result of the British mission. He retained in office the high officials then appointed, and pardoned all Tibetans who had assisted the mission. But in 1909 Chinese troops were sent to operate on the Sze-ch'uen frontier against certain insurgent lamas, whom they handled severely. When the Dalai Lama attempted to give orders that they should cease, the Chinese *amban* in Lhasa disputed his authority, and summoned the Chinese troops to enter the city. They did so, and the Dalai Lama fled to India in February 1910, staying at Darjeeling. Chinese troops followed him to the frontier, and he was deposed by imperial decree. The British government, in view of the apparent intention of China to establish effective suzerainty in Tibet, drew the attention of the government at Peking to the necessity of strictly observing its treaty obligations, and especially pointing out that the integrity of the frontier states of Nepal, Bhutan and Sikkim must be respected. To the Dalai Lama, who had attempted to obtain British intervention at Peking, it was made clear that he personally had no claim to this, as the British government could only recognize the *de facto* government in Tibet.

Authorities.—Besides the records of the earlier explorers, the following works may be consulted: Clements Markham, *Tibet* (Bogle and Manning, London, 1879); W. W. Rockhill, *The Land of the Lamas* (London, 1891); *Diary of a Journey through Mongolia and Tibet* (Washington 1895); *Geographical Journal*, vol. iii.; "Tibet from Chinese Sources," *Journ. Roy. TIBETO-BURMAN LANGUAGES. The Tibeto-Burman family comprises a long series of dialects spoken from Tibet in the north to Burma in the south, and from the Ladákh wazárat of Kashmir in the west to the Chinese provinces of Sze-ch'uen and Yünnan in the east. In the first place we have the various Tibetan dialects, spoken all over Tibet and in the neighbouring districts of India and China. Another series of dialects, the Himalayan group, is spoken in the southern Himalayas, from Lahul in the west to Bhutan in the east. Some of these dialects approach Tibetan in structure and grammatical principles, while others have struck out new lines of development, probably under the influence of the dialects spoken by an older population. East of Bhutan, to the north of the Assam valley, we find a third small group, the North Assam group, which consists of three dialects. A fourth group, the Bodo group, can be followed in a series of dialects from Bhutan in the north to the Tippeera state in the south. They have at one time extended over most of Assam west of Manipur and the Nāgā hills, and even far into Bengal proper. To the west of the Bodos, in and in the neighbourhood of the Nāgā hills we find a fifth group, the so-called Nāgā group. It comprises dialects of very different kinds. Some of them approach Tibetan and the dialect of the North Assam group. Others lead over to the Bodo languages, and others again connect the Nāgā dialects with their Tibeto-Burman neighbours to the south and east. To the south of the Nāgā hills, in the long chain of hills extending southwards under various names such as the Lushai hills, the Chin hills and the Arakan Yoma, we find a sixth group, the Kuki-Chin dialects. The old Meitei language of Manipur lies midway between this group and the easternmost branch of the Tibeto-Burman family, the Kachin group. The Kachins inhabit the tract of country to the east of Assam and to the north of Upper Burma, including the headwaters of the

Chindwin and the Irrawaddy. The Kachins have not as yet settled down, and are still pushing southwards. The Kachins and the Kuki-Chins gradually and finally merge into Burmese, the language of the ancient kingdom of Burma.

It is impossible to bring the relationship existing between all these various groups under one single formula. The dialects spoken in the Himalayas and in Assam can be described as a double chain connecting Tibetan with Burmese, which are the two principal languages of the family. In the first place the Kachin group runs from the easternmost Tibetan dialects in Sze-ch'uen down to the Burmese of Upper Burma. The second chain has a double beginning in the north. We can trace one line through the North Assam group, the Nāgā, Bodo and Kuki-Chin groups. Another line can be followed from Tibetan through the Himalayan and Bodo groups into Kuki-Chin. The latter dialects finally merge into Burmese.

The original home of the Tibeto-Burman race seems to have been on the Upper Hwangho and the Upper Yangtsze-kiang in the Chinese provinces of Sze-ch'uen and Yünnan. The oldest invaders followed the Tsangpo into Tibet and became the Tibetans of the present day. Other hordes crossed the Brahmaputra and settled in the hills on the southern slopes of the Himalaya range. From the headwaters of the Irrawaddy and the Chindwin successive waves entered Assam and Further India. Some followed the course of the Brahmaputra and settled in the hills to the south and east of the great bend of the river. Others entered the Nāgā hills, while numerous tribes must have followed the Chindwin into Manipur and the hills to the south. The inhabitants of Burma have probably come down along the Chindwin and the Irrawaddy, and the latest immigrants, the Kachins, have only in modern times begun their wanderings southwards through the hills. The tribes settled in the hills north of the Assam valley appear to possess a mixed character. Their home can be considered as a kind of backwater which has been overflowed by the waves of successive invasions.

In their original home the Tibeto-Burmans were the neighbours of Chinese and Tai tribes. Their languages are also closely related to Chinese and Tai, more closely to the former than to the latter. The agreement is apparent in the phonetical system, in vocabulary and in grammar. The principal point in which they differ is the order of words. The Tibeto-Burman family arranges the words of a sentence in the order of subject, object, verb, while the order in Chinese and Tai is subject, verb, object. Together all these languages form one great family, which is usually called Indo-Chinese.

The Indo-Chinese family is usually considered as a typical instance of the so-called isolating languages. The single words do not consist of more than one syllable. They are incapable of inflexion because there are no form-words, which merely denote relation in time and space. Grammatical relations are therefore not indicated by inflexion, but simply by putting together, according to fixed rules, words of which each retains its independence. Thus a sentence such as "the father struck the boy" would be translated "father agent son striking completion." This state of affairs, which is the prevailing condition in Chinese, is not, however, the original one. While the bases of the words are monosyllabic, *i.e.* each word consists of one syllable, comparative philology shows that these bases were often preceded by prefixes, short additions, the meaning of which cannot always be ascertained, but which modified the meaning of the base in the same way as the terminations of other languages. Such prefixes were not accented, and in the course of time they were commonly reduced and often dropped altogether, so that each word (*i.e.* the prefix plus base) itself came to be monosyllabic. Such words were then pronounced in a higher tone, and this gave rise to the development of a complicated system of tones in Chinese, Tai and some Tibeto-Burman languages. The existence of old prefixes can therefore still be inferred from the tones.

This development can still be followed in the Tibeto-Burman languages. They have, to some extent, retained the old prefixes. This is, for example, the case in Old Tibetan and some modern Tibetan dialects, while the prefixes have been dropped in the modern dialect of Central Tibet. Compare Old Tibetan *b-dun*, Balti *ab-dun*, but Central Tibetan *dün*, seven. The connexion between the dropping of prefixes and the development of tones can be seen from the fact that Balti, which has, to some extent, preserved the prefixes, is devoid of tones, while Central Tibetan has developed a system of tones corresponding to that prevailing in Chinese. The same is the case with Kachin and some Nāgā dialects, while the remaining Tibeto-Burman languages apparently agree with such Tibetan dialects as are devoid of tones. The development of tones in many dialects was probably counteracted by the influence of the speech of the former inhabitants whom the Tibeto-Burman found in possession of the country when they invaded their present habitat. Remnants of such old inhabitants are still found in the Khasi hills of Assam, in the midst of the Tibeto-Burman territory. Traces of the speech of an old, non-Tibeto-Burman population, can also be found in some dialects belonging to the Himalayan group.

Through the dropping of old prefixes several different words coincided in form. The same result was effected by another tendency, which is apparent in all Indo-Chinese languages, viz. to harden soft consonants. Thus Tibetan *ba*, cow, is often pronounced *bha* and *pa*. The confusion which might arise from this double tendency is counteracted by the system of tones and the fixed rules for the order of words.

The vocabulary is richly varied. Thus the different varieties of some animal are often denoted by separate words. On the other hand, there are few general terms or such as denote abstract ideas.

All these features of Tibeto-Burman speech tend to make the difference between the dialects considerable, and the changes within one and the same dialect bewildering. Instances are said to be on record where one small tribe has changed its language in the course of a couple of generations so as to be unrecognizable. This fact, if fact it be, can however be accounted for by assuming that the male individuals in question have robbed their wives from some other tribe. At all events, the changes are not so important in cases where we are able to compare the existing vocabulary of a tribe with words noted down, say, a century ago.

The different classes of words are not clearly distinguished, and many instances occur in which a word can be used at will as a noun, as an adjective or as a verb. The verb can, on the whole, be described as a noun of action, and we find phrases such as "my going is" instead of "I go." Inflexion is often effected by isolation. Thus gender is commonly denoted by adding words meaning "male," "female," respectively; number is indicated by means of numerals and words meaning "many," "heap"; and there is no relative pronoun and no clear distinction between the various verbal tenses. Many of the words added in order to indicate relation in time, space, &c., have, however, ceased to be used as separate words, and have become what can for all practical purposes be called case and tense affixes. The inflexion is therefore at the present date, to a great extent, effected by agglutination, *i.e.* by adding modifying particles to the base, which itself remains unchanged. Such particles are only put once if there are more than one word put together in the same relation. Thus an adjective and a qualified noun only takes one "case-suffix." Several dialects have in this way developed a complicated system of grammatical forms, partly perhaps under the influence of non-Tibeto-Burman languages.

TIBIA, a pipe played by means of a reed mouthpiece, extensively used in classic Rome. The tibia, often mistranslated "flute," was identical with the aulos of the Greeks, and according as it was made with a cylindrical or with a conical bore, it may be regarded as the prototype of our clarinet or oboe. The tibia was used at musical contests, in the theatre, in the arena, at banquets, &c. A set of ivory tibiae of cylindrical bore found at Pompeii in a good state of preservation are in the museum at Naples.

TIBULLUS, ALBIUS (*c.* 54–19 B.C.), Latin elegiac poet. The information which we possess about him is extremely meagre. Besides the poems themselves—that is to say, the first and second books—we have only a few references in later writers and a short *Life* of doubtful authority. We do not know his praenomen; his gentile name has been questioned; nor is his birthplace ascertained. His station was not improbably that of a Roman knight (so the *Life* affirms); and he had inherited a very considerable estate. But, like Virgil, Horace and Propertius, he seems to have lost the greater part of it in 41 amongst the confiscations which Antony and Octavian found expedient to satisfy the rapacity of their victorious soldiery. Tibullus's chief friend and patron was M. Valerius Messalla Corvinus, himself an orator and poet as well as a statesman and a commander. Messalla, like Maecenas, was the centre of a literary circle in Rome; but the bond between its members was that of literature alone. They stood in no relations to the court; and the name of Augustus is not once to be found in the writings of Tibullus. About 30 B.C. Messalla was despatched by Augustus to Gaul to quell a rising in Aquitania and restore order in the country, and Tibullus may have been in his retinue. On a later occasion, probably in 28, he would have accompanied his friend who had been sent on a mission to the East, but he fell sick and had to stay behind in Corcyra. Tibullus had no liking for war, and though his life seems to have been divided between Rome and his country estate, his own preferences were wholly for the country life. His first love, the subject of book i., is called Delia in the poems, but we learn from Apuleius (*Apol.* 10) that her real name was Plania. Delia seems to have been a woman of middle station. It is impossible to give an exact account of the intimacy. The poems which refer to her are arranged in no chronological order. Now she appears as single, now as married; but we do not hear anything either of her marriage or of her husband's death. It is clear, however, that it was the absence of her husband on military service in Cilicia which gave Tibullus the opportunity of making or renewing the acquaintance. It was not dropped when he returned. It was not difficult to deceive the simple soldier; and Delia was an apt pupil in deception—too apt, as Tibullus saw with dismay when he found that he was not the only lover. His entreaties and appeals were of no avail; and after the first book we hear no more of Delia. In the second book the place of Delia is taken by Nemesis, which is also a fictitious name. Nemesis (like the Cynthia of Propertius) was a courtesan of the higher class; and she had other admirers besides Tibullus. He complains bitterly of his bondage, and of her rapacity and hardheartedness. In spite of all, however, she seems to have retained her hold on him until his death. Tibullus died prematurely, probably in 19, and almost immediately after Virgil. His death made a deep impression in Rome, as we learn from his contemporary Domitius Marsus and from the elegy in which Ovid (*Amores*, iii. 19) has enshrined the memory of his predecessor.

The character of Tibullus is reflected in his poems. Though not an admirable it is certainly an amiable one. He was a man of generous impulses and a gentle unselfish disposition. He was loyal to his friends to the verge of self-sacrifice, as is shown by his leaving Delia to accompany Messalla to Asia, and constant to his mistresses with a constancy but ill deserved. His tenderness towards them is enhanced by a refinement and delicacy which are rare among the ancients. Horace and the rest taunt the cruel fair with the retribution which is coming with the years. If Tibullus refers to such a fate, he does it by way of warning and not in any petty spirit of triumph or revenge. Cruelly though he may have been treated by his love, he does not invoke curses upon her head. He goes to her little sister's grave, hung so often with his garlands and wet with his tears, and bemoans his fate to the dumb ashes there. Tibullus has no leanings to an active life: his ideal is a quiet retirement in the country with the loved one at his side. He has no ambition and not even the poet's yearning for immortality. As Tibullus loved the country life so he clung to its faiths, and in an age of crude materialism and the grossest superstition, he was religious in the old Roman way. As a poet he reminds us of Collins and Longfellow. His clear, finished and yet unaffected style made him a great favourite with his countrymen and placed him, in the judgment of Quintilian, at the head of their elegiac writers. And certainly within his own range he has no Roman rival. For natural grace and tenderness, for exquisiteness of feeling and expression, he stands alone. He has far fewer faults than Propertius, and in particular he rarely overloads his lines with Alexandrian learning. But, for all that, his range is limited; and in power and compass of imagination, in vigour and originality of conception, in richness and variety of poetical treatment, he is much his rival's inferior. The same differences are perceptible in the way the two poets handle their metre. Tibullus is smoother and more musical, but liable to become monotonous; Propertius, with occasional harshnesses, is more vigorous and varied. It may be added that in many of Tibullus's poems a symmetrical composition can be traced, although the symmetry must never be forced into a fixed and unelastic scheme.

It is probable that we have lost some of the genuine poems of Tibullus. On the other hand, much has come down to us under his name which must certainly be assigned to others. Only the first and second books can claim his authorship. The first book consists of poems written at various times between 30 and 26. About the second book we can only say that in all likelihood it was published before the poet's death in 19. It is very short, containing only 428 verses, and apparently incomplete. In both books occur poems which give evidence of internal disorder; but scholars cannot agree upon the remedies to be applied.

The third book, which contains 290 verses, is by a much inferior hand. The writer calls himself Lygdamus and the fair that he sings of Neaera. He was born in the same year as Ovid, but there is nothing Ovidian about his work. He has little poetical power, and his style is meagre and jejune. He has a good many reminiscences and imitations of Tibullus and Propertius; and they are not always happy. The separation of the fourth book from the third has no ancient authority. It dates from the revival of letters, and is due to the Italian scholars of the 15th century. The fourth book consists of poems of very different quality. The first is a composition in 211 hexameters on the achievements of Messalla, and is very poor. The author is unknown; but he was certainly not Tibullus. The poem itself was written in 31, the year of Messalla's consulship. The next eleven poems relate to the loves of Sulpicia and Cerinthus. Sulpicia was a Roman lady of high station and, according to Haupt's probable conjecture, the daughter of Valeria, Messalla's sister. She had fallen violently in love with Cerinthus, about whom we know nothing but what the poet tells us, and he soon reciprocated her feelings. The Sulpicia elegies divide into two groups. The first comprises iv. 2–6, containing ninety-four lines, in which the theme of the attachment is worked up into five graceful poems. The second, iv. 8–12 (to which 7 should be added), consists of Sulpicia's own letters. They are very short, only forty lines in all; but they have a unique interest as being the only love poems by a Roman woman that have escaped the ravages of time. Their frank and passionate outpourings remind us of Catullus. The style and metrical handling betray a novice in poetical writing. The thirteenth poem (twenty-four lines) claims to be by Tibullus; but it is hardly more than a cento from Tibullus and Propertius. The fourteenth is a little epigram of four lines with nothing to determine its authorship. Last of all comes the epigram or fragment of Domitius Marsus already referred to. To sum up: the third and fourth books appear in the oldest tradition as a single book, and they comprise pieces by different authors in different styles, none of which can be assigned to Tibullus with any certainty. The natural conclusion is that we have here a collection of scattered compositions, relating to Messalla and the members of his circle, which has been added as an appendix to the genuine relics of Tibullus. When this "Messalla collection" was made cannot be exactly determined; but it was not till after the death of Tibullus, 19 B.C., and probably between 15 and 2 B.C. Besides the foregoing, two pieces in the collection called *Priapea* (one an epigram and the other a longer piece in iambics) have been attributed to Tibullus; but there is little external and no internal evidence of his authorship (see Hiller in *Hermes*, xviii. 343–349).

The value of the short *Vita Tibulli*, found at the end of the Ambrosian, Vatican and inferior MSS., has been much discussed. There is little in it that we could not at once infer from Tibullus himself and from what Horace says about Albius, though it is possible that its compiler may have taken some of his statements from Suetonius's book *De poetis*. It is as follows: "Albius Tibullus eques R. (R. being the customary abbreviation for *Romanus*, the MSS. have the corruption *regalis*), insignis forma cultuque corporis observabilis, ante alios Corvinum Messalam Oratorem (MSS. *Or.*, *i.e. oratorem*) ingenue (MSS. *iginem*) dilexit, cuius et contubernalis Aquitanico bello militaribus donis donatus est. Hic multorum iudicio principem inter elegiographos optinet locum. Epistulae quoque eius, quamquam breves, omnino utiles sunt (the "letters" are the Sulpicia elegies). Obiit adulescens, ut indicat epigramma superscriptum" (*i.e.* the one ascribed to Domitius Marsus. These words seem to be a later addition to the *Life*). It is another moot question of some importance whether our poet should be identified with the Albius of Horace (*Od.* i. 33; *Epist.* i. 4), as is done by the Horatian commentator Porphyrio (A.D. 200–250) in his *Scholia*. Porphyrio's view has been most recently examined by Postgate (*Selections from Tibullus*, appendix A). If it is rejected, the authority of the *Life* is considerably impaired.

Ovid, *Trist*, iv. 10, 53 seq., "successor fuit hic [Tibullus] tibi, Galle, Propertius illi, quartus ab his serie temporis ipse fui." In the preceding couplet he had said, "Vergilium vidi tantum nec amara Tibullo tempus amicitiae fata dedere meae." Ovid, who was born in 43, would be only twenty-four at Tibullus's death if it occurred in 19. The loss of Tibullus's landed property is attested by himself (i. 1, 19 seq.), "Felicis quondam, nunc pauperis agri custodes" (cf. 41, 42). Its cause is only an inference, though a very probable one. That he was allowed to retain a portion of his estate with the family mansion is clear from ii. 4, 53. Tibullus may have been Messalla's *contubernalis* in the Aquitanian War (*Vita Tib.* and *Tib.* i. 7, 9 seq., a poem composed for Messalla's triumph), and may have received *militaria dona* (*Vita*).

Delia's name (from δῆλος) is a translation of Plania. As regards her station, it should be noticed that she was not entitled to wear the *stola*, the dress of Roman matrons (i. 6, 68). Her husband is mentioned as absent (i. 2, 67 seq.). She eludes the *custodes* placed over her (i. 2, 15 and 6, 7). Tibullus's suit was favoured by Delia's mother, of whom he speaks in very affectionate terms (i. 6, 57 seq.). For Tibullus's illness at Corcyra, see i. 3, 1 seq., 55 seq. The fifth elegy was written during estrangement (*discidium*), and the sixth after the return of the husband and during Delia's double infidelity.

Ovid, writing at the time of Tibullus's death (*Am.* iii. 9, 31), says: "Sic Nemesis longum, sic Delia, nomen habebunt, altera cura recens, altera primus amor." Nemesis is the subject of book ii. 3, 4, 6. The mention of a *lena* (ii. 6) settles her position. The connexion had lasted a year when ii. 5 was written (see ver. 109). It is worth noticing that Martial selects Nemesis as the source of Tibullus's reputation (viii. 73, 7; cf. xiv. 193).

Specimens of Tibullus at his best may be found in i. 1, 3, 89–94; 5, 19–36; 9, 45–68; ii. 6. Quintilian says (*Inst.* x. 1, 93), "Elegia quoque Graecos provocamus, *cuius mihi tersus atque elegans maxime videtur auctor Tibullus*; sunt qui Propertium malint; Ovidius utroque lascivior, sicut durior Gallus."

Charisius (pp. 66 and 105) quotes part of a hexameter which is not found in the extant poems of Tibullus.

Lygdamus is probably the real name of the author of the first six elegies in book iii., but little further is known about him. His elegies and the other poems in the third book ("third" and "fourth" books) appear to have been known to Ovid. There are agreements between iii. 5, 15–20, and three passages of Ovid, *Ars. am.* ii. 669 seq.; *Tr.* iv. 10, 6: "cum cecidit fato consul uterque pari" (Lygdamus and Ovid using word for word the same expression for the year of their birth, the consulship of Hirtius and Pansa) and *Am.* xi. 14, 23 seq., much too close to be accidental. We do not know when they were added to the genuine poems of Tibullus.

Most scholars since Lachmann have condemned the "Panegyric on Messalla." It is an inflated and at the same time tasteless declamation, entirely devoid of poetical merit. The language is often absurdly exaggerated, *e.g.* 190 seq. The author himself seems to be conscious of his own deficiencies (1 seq., 177 seq.). Like so many of his contemporaries, he had been reduced to poverty by the loss of his estates (181 seq.). If we could set the question of poetical merit aside, it would not be impossible to identify him with Propertius as in fact is done by Némethy (*op.* cited below). The date is fixed by 121 seq. Sulpicia was the daughter of Servius Sulpicius (iii. 16 = iv. 10, 4), and she seems to have been under the tutelage of Messalla, her uncle by marriage (Haupt, *Opuscula*, iii. 502 seq.).

Some scholars attribute iii. 8–12 = iv. 2–6 to Tibullus himself; but the style is different, and it is best to answer the question, as Bährens does, with a *non liquet*.

The direct ascription of iii. 19 = iv. 13 (verse 13, "nunc licet e caelo mittatur amica Tibullo") to Tibullus probably led to its inclusion in the collection and later on to the addition of the third book to the two genuine ones. For the evidence against the ascription, see Postgate, *Selections*, app. C.

Manuscripts.—The two best MSS. of Tibullus are the Ambrosianus (A), of date about 1374, and the Vaticanus (V), of the 15th century. Besides these we have a number of extracts from Tibullus in *Florilegium Parisinum*, an anthology from various Latin writers which probably goes back to the 11th century, and the *Excerpta frisingensia*, preserved in an 11th-century MS. now at Munich, unfortunately very few in number. Also excerpts from the lost *Fragmentum cuiacianum*, made by Scaliger, and now in the library at Leiden. It only contained the part from iii. 4, 65 to the end. The *Codex cuiacianus*, a late MS. containing Catullus, Tibullus and Propertius, is still extant.

Editions.—Tibullus was first printed with Catullus, Propertius, and the *Silvae* of Statius by Vindelinus de Spira (Venice, 1472), and separately by Florentius de Argentina, probably in the same year. Amongst other editions we may mention those by Scaliger (with Catullus and Propertius, 1577, &c.), Broukhusius (1708), Vulpius (1749), Heyne (1817, 4th ed. by Wunderlich, with supplement by Dissen, 1819), Huschke (1819), Lachmann (1829), Dissen (1835). Among more recent texts Bährens (1878, the first of the modern critical editions), L. Müller (1880, with a useful introduction), Hiller (1885, with index verborum), Postgate (1905). Of the commentaries Heyne's, Huschke's and Dissen's are still of value. The most recent (with Latin notes) is Némethy's (1905–1906). The greater part of the poems are included in Postgate's *Selections* (with English notes, 1903). For further information see the accounts in Teuffel's *History of Roman Literature* (translated by Warr), Schanz's *Geschichte der römischen Litteratur*, and Marx's article *s.v.* "Albius," in Pauly-Wissowa's *Realencyclopädie*. A history of recent contributions is given in A. Cartault's *A propos du corpus Tibullianum* (1906; not quite complete); see also his *Tibulle et les auteurs du Corpus Tibullianum* (Paris, 1909). The following translations into English verse are known—by Dart (London, 1720), Grainger (1739, with Latin text and notes), Cranstoun (1872). *An Essay towards a New Edition of the Elegies of Tibullus, with a Translation and Notes* (London, 1792), contains only i. 1 and 7, 29–48. C. A. Elton's *Specimens of the Classic Poets* (London, 1814; xii. 141–171) contains i. 1; ii. 4; iii. 2–4; 6, 33 to end; iv. 2, 3. To these should probably be added *Tibullus, with other Translations from Ovid, Horace*, &c., by Richard Whiffin (London, 1829). Cranstoun's is the only complete version of merit; but it is far inferior to the translations by Elton. (J. P. P.)

TIBUR (mod. Tivoli, *q.v.*), an ancient town of Latium, 18 m. E.N.E. of Rome by the Via Tiburtina (see TIBURTINA, VIA). It is finely situated at the point where the Anio forms its celebrated falls; it is protected on the E., N., and N.W. by the river and it commands the entrance to its upper course, with an extensive view over the Campagna below. The modern town is in part built upon the terraces of a large temple of Hercules Victor, the chief deity of Tibur, of which some remains exist: many small votive objects in terra-cotta were found in the gorge of the Anio below the town on the north-west in 1898. Below it, on the cliffs above the Anio, is a large building round a colonnaded courtyard in *opus reticulatum* built over the Via Tiburtina (which passes under it in an arched passage), generally known as the villa of Maecenas, but shown by the discovery of inscriptions to have been in reality the meeting place of the Herculanei Augustales, connected probably with the temple.

In an ancient hall at one side of the modern cathedral two *mensae ponderariae*—marble tables with holes in them for measuring solids—erected by one M. Varenus Diphilus, a freedman, a *magister herculaneus*, were found *in situ* in 1883, and in 1902 two vases of statues erected by Diphilus, as inscriptions showed, in honour of his patron, and a bas-relief of a bearded Hercules entirely draped in a long tunic with a lion's skin on his shoulders.

Remains of two small temples—one circular, with Corinthian columns, the other rectangular with Ionic columns—stand at the north-east extremity of the town, above the waterfalls. They are traditionally, but without foundation, attributed to Vesta and the Sibyl of Tibur (Varro adds Albunea, the water goddess worshipped on the banks of the Anio as a tenth Sibyl to the nine mentioned by the Greek writers.

The so-called Tempio della Tosse, an octagonal domed structure just below the town, is probably a tomb of the 4th century A.D. Two Roman bridges and several tombs were found above the falls in 1826.

Tibur was a favourite place of resort in Roman times, and both Augustus and Maecenas had villas here, and possibly Horace also. It is certain that a house was shown as being his in the time of Suetonius; and this has been identified with a villa of the Augustan period, the site of which is now occupied by the monastery of S. Antonio. In his poems he frequently mentions Tibur with enthusiasm. Catullus and Statius, too, have rendered it famous by their poems. The abundance of water from aqueducts and springs and the falls of the Anio were among its chief attractions. The remains of villas in the district are numerous and important (see T. Ashby in *Papers of the British School at Rome*, iii.). The largest is that of Hadrian, situated in the low ground about 2 m. to the south-west of Tibur, and occupying an area of some 160 acres. The remains are extensive and well preserved, though the identifications of the existing buildings with those mentioned by Spartianus who records that Hadrian gave to them the names of various well-known edifices at Athens and elsewhere, cannot in most cases be treated as certain. A large number of statues have been found in the villa, and costly foreign marbles and fine mosaic pavements, some of the last being preserved *in situ*, while among others may be named the mosaic of the doves in the Capitol and that of the masks in the Vatican. Of the fresco and stucco decorations of the walls and ceilings, less is naturally preserved. Excavations have gone on since the 16th century, the last having been carried on by the Italian government to which the greater part of the site now belongs: but little has been done since 1884.[1]

The ancient Tibur was founded, according to tradition, by Tiburtus, Corax and Catillus, grandsons of Amphiaraus. Though on the edge of the Sabine mountains, it was a member of the Latin League. There are remains of ancient roads and outlying forts in its territory dating from the period of its independence. It allied itself with the Gauls in 361 B.C., and in the war which followed the towns of Empulum and Saxula were destroyed (their sites are unknown) and triumphs over Tibur were celebrated in 360 and 354 B.C., and again in 338, when its forces were defeated, with those of Praeneste. It did not, however, lose its independence, but became an ally of Rome, as is shown by an inscription, probably of the 2nd century B.C., in which it is recorded that the ambassadors of Tibur successfully cleared themselves before the Roman senate of a suspicion that they were acting contrary to their treaty with Rome. It acquired Roman citizenship in 90 B.C., though some of its citizens gained the franchise previously. Syphax, king of Numidia, died in the territory of Tibur as a captive in 201 B.C.; and in A.D. 273 Zenobia, queen of Palmyra, was assigned a residence here by Aurelian. Its prosperity during the imperial period was mainly due to the favour in which it stood as a summer resort. During the siege of Rome by Narses, Belisarius occupied Tibur: it was afterwards treacherously surrendered to Totila, whose troops plundered it, but who rebuilt it in A.D. 547.

See H. Dessau in *Corp. inscript. latin.* xiv. 365 sqq. and reff. (Berlin, 1887); *Notizie degli scavi*, passim. (T. As.)

TIBURTINA, VIA, an ancient road of Italy, leading E.N.E. from Rome to Tibur, a distance of about 18 m. It must have come into existence, as a track at any rate, during the establishment of the Latin League. Though it afterwards became an important thoroughfare, the first portion of it always retained its original name, that of Via Valeria (see VALERIA, VIA) being applied only to the portion of the road beyond Tibur. The road is in the main followed by a modern highroad. There is, however, a difficulty about the last portion of its course from the Albulae Aquae (*q.v.*) to Tibur; whereas, according to the milestones and itineraries, it should be 20 m. from Rome to Tibur, it is impossible to make the distance more than 18 m. along any probable line.

See T. Ashby in *Papers of the British School at Rome*, iii. 84 sqq. (T. As.)

TICHBORNE CLAIMANT, THE. Roger Charles Tichborne (1829–1854), whose family name became a household word on account of an attempt made by an impostor in 1868 to personate him and obtain his heritage, was the eldest grandson of Sir Edward Tichborne, the 9th baronet, of a very ancient Hampshire family. Sir John de Tichborne, sheriff of Southampton, was created a baronet by James I. in 1621, and from him his descendants inherited great wealth and the position of one of the leading Roman Catholic families in the south of England. Roger Charles, born at Paris on the 5th of January 1829, was the eldest son of James Francis Doughty-Tichborne (who subsequently became 10th baronet and died in 1862) by Henriette Felicité, natural daughter of Henry Seymour of Knoyle, in Wiltshire. This lady, who hated England, was intent upon bringing up her son as a Frenchman; the result was that he got hardly any education until he went in 1846 to Stonyhurst, whence he proceeded in 1849 to Dublin and joined the 6th Dragoon Guards. His eccentricity and his French accent made him a butt in his regiment, and, being disappointed of war service, he sold out in 1852, and in the following year proceeded on a trip to South America. He sailed in March 1853 from Havre for Valparaiso, whence he crossed the Andes, reaching Rio de Janeiro in 1854. In April of that year he sailed from Rio in the "Bella" and was lost at sea, the vessel foundering with all hands. His insurance was paid and his will proved in July 1855. The baronetcy and estates passed in 1862 to Roger's younger brother, Sir Alfred Joseph Doughty-Tichborne, who died in 1866. The only person unconvinced of Roger's death was his mother the dowager Lady Tichborne, from whom every tramp-sailor found a welcome at Tichborne Park. She advertised largely and injudiciously for the wanderer, and in November 1865 she learnt, through an agency in Sydney, that a man "answering to the description of her son" had been found in the guise of a small butcher at Wagga Wagga, in Queensland. As a matter of fact, the supposed Sir Roger did not correspond at all to the lost heir, who was slim, with sharp features and straight black hair, whereas the claimant was enormously fat, with wavy, light-brown hair. His first letter to Lady Tichborne was not only ignorant and illiterate, but appealed to circumstances (notably a birth-mark and an incident at Brighton) of which she admitted that she had no recollection. But so great was her infatuation with her fixed idea, that she soon overcame the first qualms of distrust and advanced money for the claimant to return to Europe. Like all pretenders, this one was impelled by his entourage, who regarded him in the light of an investment. He himself was reluctant to move, but the credulity of persons under the influence of a romantic story soon came to his aid. Thus an old friend of Sir James Tichborne's at Sydney, though puzzled by the claimant's answers, was convinced by a resemblance to his supposed father. At Sydney, too, he made the acquaintance of Bogle, a negro servant of a former baronet. Bogle sailed with him from Sydney in the summer of 1866, and coached him in the rudiments of the rôle which he was preparing to play. On reaching London on Christmas Day 1866 the claimant paid a flying visit to Tichborne House, near Alresford, where he was soon to obtain two important allies in the old family solicitor, Edward Hopkins, and a Winchester antiquary, Francis J. Baigent, who was intimately acquainted with the Tichborne family history. He next went over to Paris, where in an hotel bedroom on a dark January afternoon he was promptly "recognized" by Lady Tichborne. This "recognition" naturally made an enormous impression upon the English public, who were unaware that Lady Tichborne was a monomaniac. That such a term is no exaggeration is shown by the fact that she at once acquiesced in her supposed son's absolute ignorance of French. She allowed the claimant £1000 a year, accepted his wife, a poor illiterate girl, whom he had married in Queensland, and handed over to him the diaries and letters written by Roger Tichborne from South America. From these documents the claimant now carefully studied his part; he learnt much, too, from Baigent and from two carabiniers of Roger's old regiment, whom he took into his service. The villagers in Hampshire, a number of the county families, and several of Tichborne's fellow officers in the 6th Dragoons, became eager victims of the delusion. The members of the Tichborne family in England, however, were unanimous in declaring the claimant to be an impostor, and they were soon put upon the track of discoveries which revealed that Tom Castro, as the claimant had been called in Australia, was

[1] See H. Winnefeld, *Die Villa des Hadrian* (Berlin, 1895). *Jahrbuch des k. d. arch. Instituts*, Ergänzungsheft III.: R. Lanciani, *La Villa Adriana* (Rome, 1906).

identical with Arthur Orton (1834–1898), the son of a Wapping butcher, who had deserted a sailing vessel at Valparaiso in 1850, and had received much kindness at Melipilla in Chile from a family named Castro, whose name he had subsequently elected to bear during his sojourn in Australia. It was shown that the claimant, on arriving in England from Sydney in 1866, had first of all directed his steps to Wapping and inquired about the surviving members of his family. It was discovered, too, that Roger Tichborne was never at Melipilla, an assertion to which the claimant, transferring his own adventures in South America to the account of the man whom he impersonated, had committed himself in an affidavit. These discoveries and the deaths of Lady Tichborne and Hopkins were so discouraging that the "claimant" would gladly have "retired" from the baronetage; but the pressure of his creditors, to whom he owed vast sums, was importunate. A number of "Tichborne bonds" to defray the expenses of litigation were taken up by the dupes of the imposture, and an ejectment action against the trustees of the Tichborne estates (to which the heir was the 12th baronet, Sir Henry Alfred Joseph Doughty-Tichborne, then two years old) finally came before Chief Justice Bovill and a special jury at the court of common pleas on the 11th of May 1871. During a trial that lasted over one hundred days the claimant exhibited an ignorance, a cunning and a bulldog tenacity in brazening out the discrepancies and absurdities of his depositions, which have probably never been surpassed in the history of crime. Over one hundred persons swore to the claimant's identity, the majority of them—and they were drawn from every class—being evidently sincere in their belief in his cause. It was not until Sir John Coleridge, in a speech of unparalleled length, laid bare the whole conspiracy from its inception, that the result ceased to be doubtful. The evidence of the Tichbornes finally convinced the jury, who declared that they wanted no further evidence, and on the 5th of March 1872 Serjeant Ballantine, who led for the claimant, elected to be non-suited. Orton was immediately arrested on a charge of perjury and was brought to trial at bar before Chief Justice Cockburn in 1873. The defendant showed his old qualities of impudence and endurance, but the indiscretion of his counsel, Edward Kenealy, the testimony of his former sweetheart, and Kenealy's refusal to put the Orton sisters in the box, proved conclusive to the jury, who, on the one hundred and eighty-eighth day of the trial, after half-an-hour's deliberation found that the claimant was Arthur Orton. Found guilty of perjury on two counts, he was sentenced on the 28th of February 1874 to fourteen years' penal servitude. The cost of the two trials was estimated at something not far short of £200,000, and of this the Tichborne estates were mulcted of fully £90,000. The claimant's better-class supporters had deserted him before the second trial, but the people who had subscribed for his defence were stanch, while the populace were convinced that he was a persecuted man, and that the Jesuits were at the bottom of a deep-laid plot for keeping him out of his own. There were symptoms of a riot in London in April 1875, when parliament unanimously rejected a motion (by Kenealy) for referring the Tichborne case to a royal commission, and the military had to be held in readiness. But the agitation subsided, and when Orton emerged from gaol in 1884 the fickle public took no interest in him. The sensation of ten years earlier could not be galvanized into fresh life either by his lectures or his alternate confessions of imposture and reiterations of innocence, and Orton sank into poverty and oblivion, dying in obscure lodgings in Marylebone on the 2nd of April 1898. (T. SE.)

TICINO (Ger. *Tessin*, anc. *Ticinus*), a river of Switzerland and north Italy, which gives its name to the Swiss canton of Ticino (*q.v.*), and gave it in classical times to the town of Ticinum (Pavia). It rises at the foot of the Gries Pass to the west of Airolo; from Airolo to the Lago Maggiore its valley bears the name of Val Leventina, and is followed as far as Bellinzona by the St Gotthard road and railway. It flows through Lago Maggiore, leaving it at its south end at Sesto Calende, and thence flows S.S.E. into the Po, which it joins a little way south of Pavia.

TICINO (Fr. and Ger. *Tessin*), a canton of Switzerland, the only one situated almost wholly on the southern slope of the Alps and inhabited by a population of which the majority is Italian-speaking. It takes its name from the Ticino river, the whole upper course of which (the Val Leventina, with its side glen of Val Blenio, the so-called Riviera, extending from Biasca to near Bellinzona, and the bit beyond Bellinzona), till it swells into the Lago Maggiore, is within the canton. Not far from the head of the Lago Maggiore the lake is increased by the Maggia torrent which is formed by the union of the torrents descending from the mountain glens known as the valleys of Locarno, save the Val Verzasca, the stream from which falls into the lake without joining the Maggia. The third portion of the canton is that called Monte Cenere, including the hilly region between Bellinzona on the Ticino and Lugano, together with most of the lake of that name, and stretching on the south as far as Mendrisio, not far from Como. These three districts were all formerly part of the duchy of Milan till conquered by the Swiss, and in 1803 were joined together to form a Swiss canton of the most artificial kind (Campione, opposite Lugano, is still an Italian "enclave"). Its total area is 1081·1 sq. m., of which 721·9 sq. m. are reckoned as "productive" (forests covering 267·2 sq. m. and vineyards 19·9 sq. m.), while of the rest part is taken up by the Lake of Lugano (the Swiss share of which is $7\frac{1}{2}$ sq. m.), and those of the Lago Maggiore (Swiss share $16\frac{1}{4}$ sq. m.), and by $13\frac{1}{4}$ sq. m. of glaciers. In point of size the canton is surpassed by only four other cantons (Bern, the Grisons, the Valais, and Vaud), while only Vaud can boast of a larger vine-growing district. The highest points in the canton are two of the loftiest summits of the two halves of the Lepontine Alps—the Basodino (10,749 ft.) and the Rheinwaldhorn or Piz Valrhein (11,149 ft.) in the Adula Alps. Save the Ticino valley between Biasca, Bellinzona and Locarno, and the environs of Lugano, the canton is principally composed of hills and mountains, and is therefore poor from the material point of view, though rich in fine scenery.

The canton is traversed from end to end, from Airolo at the southern mouth of the St Gotthard tunnel to beyond Mendrisio (about 74 m.), by the main line of the St Gotthard railway, many of the marvellous engineering triumphs of which occur between Airolo and Biasca. From Bellinzona there is a short branch railway to Locarno (14 m.), whence another runs up to Bignasco ($17\frac{1}{2}$ m.), while from Lugano there is a mountain line up the Monte S. Salvatore (3004 ft.), and from Capolago another similar line up the Monte Generoso (5591 ft., that summit being just on the political frontier). Till 1859 the canton was legally included in the Italian dioceses of Milan (the portion north of Bellinzona, the Val Leventina and the Val Blenio therefore still using the ancient "Ambrosian Liturgy") and of Como (the rest of the canton). In that year the Swiss Confederation abolished this foreign jurisdiction, but practically the two bishops named had charge of these districts till in 1888 the purely Swiss diocese of Lugano was set up, being now joined to that of Basel, and governed by an administrator apostolic. In 1900 the population of the canton was 138,638, of whom 134,774 were Italian-speaking, 3180 German-speaking and 403 French-speaking, while 135,828 were Romanists, 2209 Protestants and 18 Jews. Of the German-speaking inhabitants 260 belonged to the hamlet of Bosco or Gurin, situated at the head of one of the side glens of the Val Maggia, and colonized before 1253 from the neighbouring Tosa or Pommat valley (now politically Italian), which is inhabited by German-speaking emigrants from the canton of the Valais. In 1900 there were in the canton 75,731 women to 62,907 men, the men being in the habit of emigrating in search of work. Up to 1881 Bellinzona, Locarno and Lugano were alternately the political capital, each for six years, but since 1881 Bellinzona is the permanent capital. Yet it is but the second town in size, being surpassed by Lugano (*q.v.*), while after it come Locarno (*q.v.*) and Mendrisio (3338 inhabitants). Being practically Italian, though now "Italian Switzerland," the canton has produced many sculptors, painters and architects. But its industrial development is backward, though the opening of the St Gotthard railway has attracted many foreign travellers. Yet the male population largely migrate in search of work and wages as coffee-house keepers (such as Delmonico, of New York), waiters in cafés, masons, plasterers, labourers, navvies, &c. Fruit, chestnuts and wine are among the principal exports. The canton is divided into 8 administrative districts, which comprise 265 communes. The cantonal constitution is still that of 1830, which, however, has been almost mended out of sight owing to the political struggles that have raged in the canton. The legislature (*Gran consiglio*) is composed of members elected (since 1880) in the proportion of one to every 1200 (or fraction over 600) of the Swiss inhabitants, and holding office for four years. The executive (*Consiglio di stato*) is (since 1892) elected directly by the people, is composed (since 1875) of five members, and holds office for four years. Since 1883 5000 citizens have the right (facultative referendum) of claiming a popular vote as to bills passed by the legislature, while (since 1892) 5000 citizens have the right of "initiative" in legislative matters, though 7000 signatures are required in case of a proposal to revise the cantonal constitution. In 1891 the system of proportional representation was introduced for elections to the cantonal legislature and the communal assemblies. In 1904 a very complicated system of proportional representation was adopted by a narrow majority of the people of Ticino. In elections to the cantonal legislature all fractions below that required to secure a member in the entire canton are added together and then divided by the number of the non-elected candidates, plus one, the persons thus selected being, as far as possible, assigned to the constituencies in which they have obtained most votes (the point remains obscure). In 1904 also the "limited vote" was adopted as to the election of members of the executive, no one being allowed to vote for more than four out of the five members. In 1896, by a strange anomaly only to be explained by the previous political history of the canton, non-resident citizens were given a vote in all cantonal and communal matters, though residence is strictly required for all voters in Federal matters. The two members of the federal *Ständerath* and the seven members of the Federal *Nationalrath* are elected by a popular vote.

The canton is made up of all the permanent conquests (with one or two trifling exceptions) made by different members of the Swiss Confederation south of the main chain of the Alps. From an historical point of view Italian Switzerland falls into three groups: (1) the Val Leventina conquered by Uri in 1440 (previously held from 1403 to 1422); (2) Bellinzona (previously held from 1419 to 1422); the Riviera and the Val Blenio, all won in 1500 from the duke of Milan by men from Uri, Schwyz and Nidwalden, and confirmed by Louis XII. of France in 1503; (3) Locarno, Val Maggia, Lugano and Mendrisio, seized in 1512 by the Confederates when fighting for the Holy League against France, ruled by the twelve members then in the league, and confirmed by Francis I. in the treaty of 1516. These districts were governed by bailiffs holding office two years and purchasing it from the members of the League; each member of group 3 sent annually an envoy, who conjointly constituted the supreme appeal in all matters. This government was very harsh and is one of the darkest pages in Swiss history. Yet only one open revolt is recorded—that of the Val Leventina against Uri in 1755. In 1798 the people were distracted by the Swiss and "Cisalpine republic" parties, but sided with the Swiss. On being freed from their hated masters, they were formed into two cantons of the Helvetic republic—Bellinzona (=1 and 2 above) and Lugano (=3). In 1803 all these districts were formed into one canton—Ticino—which became a full member of the Swiss Confederation. From 1810 to 1813 it was occupied by the troops of Napoleon. The carriage road over the St Gotthard (1820–1830) was made under the constitution of 1814. But many of the old troubles reappeared, and were only done away with by the constitution of the 23rd of June 1830. In 1848, on religious grounds and owing to fears as to customs duties, the canton voted in the minority against the Federal constitution of that year; but in 1874, though the people voted against the revised constitution, the legislature adopted it, and the canton was counted as one of the majority. Since 1830 the local history of the canton has been very disturbed owing to the fact that, though Roman Catholicism is the state religion, and all the population are Roman Catholic (the few Protestants having been expelled from Locarno in 1555), they are divided between the Radical and Ultramontane parties. Since 1876 the intervention of Federal troops (already known in 1870) has been frequent in consequence of conflicts of the local authorities *inter se*, or against the Federal Assembly.

The political troubles of Ticino were increased in 1888 by the foundation of the see of Lugano, considered by the Radicals as likely to advance Clericalism, though it freed Switzerland from foreign ecclesiastical rule. Hence in September 1890 the Radicals carried out a bloody revolution, which necessitated Federal intervention, but at a state trial at Zürich in July 1891 the leaders were acquitted. Political passions still run high in the canton, as the Radicals and Conservatives are nearly balanced in point of numbers.

TICINUM (mod. *Pavia*, *q.v.*), an ancient city of Gallia Transpadana, founded on the banks of the river of the same name (mod. *Ticino*) a little way above its confluence with the Padus (Po). It is said by Pliny to have been founded by the Laevi and Marici, two Ligurian tribes, while Ptolemy attributes it to the Insubres. Its importance in Roman times was due to the extension of the Via Aemilia from Ariminum to the Padus (187 B.C.), which it crossed at Placentia and there forked, one branch going to Mediolanum and the other to Ticinum, and thence to Laumellum where it divided once more—one branch going to Vercellae (and thence to Eporedia and Augusta Praetoria) and the other to Valentia (and thence to Augusta Taurinorum or to Pollentia). The branch to Eporedia must have been constructed before 100 B.C. Ticinum is not infrequently mentioned by classical writers. It was a municipium, and from an inscription we know that a triumphal arch was erected in honour of Augustus and his family, but we learn little of it except that in the 4th century A.D. there was a manufacture of bows there. It was pillaged by Attila in A.D. 452 and by Odoacer in 476, but rose to importance as a military centre in the Gothic period. At Dertona and here the grain stores of Liguria were placed, and Theodoric constructed a palace, baths and amphitheatre and new town walls; while an inscription of Athalaric relating to repairs of seats in the amphitheatre is preserved (A.D. 528–529). From this point, too, navigation on the Padus seems to have begun. Narses recovered it for the Eastern Empire, but after a long siege, the garrison had to surrender to the Lombards in 572. The name Papia, from which the modern name Pavia comes, does not appear until Lombard times, when it became the seat of the Lombard kingdom, and as such one of the leading cities of Italy. Cornelius Nepos, the biographer, appears to have been a native of Ticinum. Of Roman remains little is preserved—there is, for example, no sufficient proof that the cathedral rests upon an ancient temple of Cybele—though the regular ground plan of the central portion, a square of some 1150 yds., betrays its Roman origin, and it may have sprung from a military camp. This is not unnatural, for Pavia was never totally destroyed; even the fire of 1004 can only have damaged parts of the city, and the plan of Pavia remained as it was. Its gates were possibly preserved until early in the 19th century. The picturesque covered bridge which joins Pavia to the suburb on the right bank of the river was preceded by a Roman bridge, of which only one pillar, in blocks of granite from the Baveno quarries, exists under the central arch of the medieval bridge, the rest having no doubt served as material for the latter. The medieval bridge dates from 1351–1354.

See A. Taramelli in *Notizie degli scavi* (1894), 73 sqq. and reff.

(T. As.)

TICKELL, THOMAS (1686–1740), English poet and man of letters, the son of a clergyman, was born at Bridekirk near Carlisle in 1686. After a good preliminary education he went (1701) to Queen's College, Oxford, taking his M.A. degree in 1709. He became fellow of his college in the next year, and in

1711 university reader or professor of poetry. He did not take orders, but by a dispensation from the Crown was allowed to retain his fellowship until his marriage in 1726. Tickell's success in literature, as in life, was mainly due to the friendship of Addison, who procured for him (1717) an under-secretaryship of state, to the chagrin of Richard Steele, who thenceforth bore Tickell no goodwill. During the peace negotiations with France Tickell published in 1713 the *Prospect of Peace*. In 1715 he brought out a translation of the first book of the *Iliad* contemporaneously with Pope's version. Addison's reported description of Tickell's version as the "best that ever was in any language" roused the anger of Pope, who assumed that Addison himself was the author,[1] or had at any rate the principal share in the work. Addison gave Tickell instructions to collect his works, which were printed in 1721 under Tickell's editorship. In 1724 Tickell was appointed secretary to the lords justices of Ireland—a post which he retained until his death, which took place at Bath on the 23rd of April 1740.

Kensington Gardens (1722), his longest poem, is inflated and pedantic. It has been said that Tickell's poetic powers were awakened and sustained by his admiration for the person and genius of Addison, and undoubtedly his best work is the sincere and dignified elegy addressed to the earl of Warwick on Addison's death. His ballad of *Colin and Mary* was long the most popular of his poems. Tickell contributed to the *Spectator* and the *Guardian*.

See "T. Tickell," in *Johnson's Lives of the Poets*; the *Spectator*; Ward's *English Poets*. His *Works* were printed in 1749 and are included in Chalmers's and other editions of the English Poets.

TICKET (O. Fr. *estiquet*, also *estiquette*, mod. *étiquette*, from Ger. *stechen*, to stick up), by origin a small bill stuck up for the purpose of giving notice or information, hence a small printed or written card or slip, containing a notice, order or the like, and more particularly such an one as embodies the terms under which the party issuing the ticket grants some right, privilege or licence to the party to whom it is issued; where there has been valuable consideration for such given by the holder the ticket is the method by which the parties enter into a contract. The most familiar of this last class of tickets is the passenger's ticket issued by railway companies, tramways or "common carriers" in general. The ticket does not usually contain the whole terms of the contract, but refers to the conditions under which it is issued, to which the holder is considered subject if sufficient notice of them is given. A ticket of admission issued for a theatre, or place of entertainment, constitutes a licence to the holder to occupy and use a seat, whether particularized or not, and such parts of the building as may be open to him. Such a licence can be revoked by the issuer, and the holder may be ejected as a trespasser, subject to his right to bring an action for damages.

TICKET-OF-LEAVE, a term first invented for the "emancipists" in the days of Australian transportation (see DEPORTATION); in the English penal system, a document or "pass" handed to a convict who has completed the second stage of his sentence and is about to enter the third and last, that of conditional liberation or semi-freedom, in which he goes at large to earn his own livelihood as a more or less independent member of the community. The "ticket" or "licence" is the outward sign of "remission" gained by industry and blameless conduct in prison (see PRISON), and it may be forfeited for disobedience or neglect of certain conditions endorsed upon the licence. Convicts are by law required to report themselves at an appointed place within forty-eight hours after liberation and again every succeeding month at the police station nearest to their place of abode, between the hours of nine in the morning and nine in the evening. They must get their living by honest means and regular employment, and must reside—that is to say, sleep—at the address notified by them to the police in order that they may be found at once if required for any legal and justifiable purpose. If they change their address or withdraw from any known police district, they must give notice of their removal at the police station at which they have been reporting, stating the place to which they are going, and, as far as practicable, their address there, and also at the nearest police station within forty-eight hours of arriving in any other police district in any part of the United Kingdom. They must produce their licences whenever they are called upon to do so by a police officer.

This treatment of offenders who have already expiated their crimes has been deemed to bear heavily on any who are anxious to turn over a new leaf. To be ever subject to the watchfulness of the police must often increase the licence-holder's difficulty of leading an honest life. The struggle is known to be often severe; employers of labour are not too ready to accept the services of "gaol birds," and free workmen often resent the admission of an old convict amongst their number. Private charity has come forward to diminish or remove this hardship, and many societies have been called into existence for the purpose of assisting discharged prisoners. They are to be found in most of the principal cities of the United Kingdom. London alone has those of the Church Army, the St Giles's Christian Mission, the Salvation Army, the Catholic Aid Society and the Royal Society for the Assistance of Discharged Prisoners, which was founded in 1856 and has done a vast and meritorious work. It labours chiefly in the metropolis; it is supported by private subscriptions, but it has control also over the gratuities of the licencees who accept its aid. The prisoners on release are first examined at the society's office as to their prospects and wishes; they are given some pocket-money out of their own gratuities; and their "liberty clothing," a present from the prison, is changed for more suitable clothes. They are then placed in respectable lodging-houses until employment is obtained for them, after which the society undertakes the reporting to the police and by its own agents exercises a watch over its protégés. There are upwards of sixty-five societies, all certified by the secretary of state, of which the number is increasing; every year the subscriptions increase, more money is expended, more cases are aided and more ex-convicts are rehabilitated. Unfortunately a large number of those who solicit help belong to the class of "lazy loafers who like neither work nor honesty," and who, when the first is found, will not adhere to the latter. Most of the societies employ agents who act as intermediaries between employers and ex-convicts and fill a place analogous to that of the "probation officers" in parts of the United States (see PROBATION); but the probation officer generally interposes at an earlier stage and shields the first offender from the consequences of his act, by sparing him a visit to the gaol. In a speech on Prison Reform in the English House of Commons on the 20th of July 1910, the home secretary outlined a proposed scheme for abolishing ticket-of-leave altogether, and entrusting the after-supervision of released prisoners to a central agency of semi-official character.

Aid to discharged prisoners has been largely undertaken in European countries, where it is known under the name of *patronage*. Local societies exist in most of the capitals and chief cities, and efforts are made to rescue neglected or criminal children and find work for adults on leaving gaol. This assistance has been called by its keenest supporters the best prophylactic for crime. Conditional liberation is in force in most of the Northern states of America, and prisoners are constantly released on "parole" when they have satisfied the parole board (of prison officials) that they will not abuse their liberty; a watch is kept over all thus released, who are expected to make a monthly report of their conduct and actual position at the time of reporting. If any one relapses he is liable to recommittal.

See *Three Reports of Commons' Committee on the Operation of the Act substituting other Punishment in lieu of Transportation* (1856); F. H. Wines, *Punishment and Reformation* (1895). (A. G.).

TICKING, a strong linen or cotton fabric usually woven in stripes of colour; blue and pink with white being the most common. The name is derived from a word "tick," common in various forms to many languages, signifying a case or sheath.

[1] See Warton's note in the *Bathos* (ed. Pope and Elwin, x. 388) where he quotes from Tickell's version and from Addison and says the same author.

Ticking is used for mattresses, awnings and tents. In some qualities it is also used as a foundation for embroidery.

White, grey, or brownish warp threads are usually flax, while the coloured threads are often cotton. The weft is flax or tow. The warps of many of the cheaper kinds are made entirely of cotton, and jute is used for weft in the cheapest grades. A feather tick should be made of fine flax yarns set closely, and there should also be a large number of weft threads per inch. Sometimes the inside of the tick is waxed in order to prevent the feathers from working out.

The structure of the fabric is termed a twill, of which four varieties, each showing four units, are illustrated. Fig. 1, the ordinary three-leaf twill, is more extensively used than any other. Occasionally

FIG. 1.

FIG. 2.

the pattern or twill is in one direction only, but more often the direction is reversed at intervals, thus producing what is technically termed a "herring-bone" or an "arrow-head" twill. Fig. 2 complete on twenty-four threads and three picks shows such a pattern, where the twill is reversed every twelve threads. Figs. 3 and 4 are

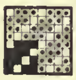

FIG. 3.

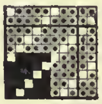

FIG. 4.

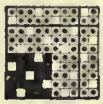

FIG. 5.

the four-thread and five-thread straight twills respectively, while fig. 5 is the five-thread sateen twill. These two latter weaves require a great number of threads and picks per inch, and are used only in the finest ticks. The plain weave is occasionally used for cheaper varieties.

Mattress ticks and awnings are woven with the same twills, but the colouring of these, especially of the former, is more elaborate.

TICKNOR, GEORGE (1791–1871), American educator and author, was born in Boston, Massachusetts, on the 1st of August 1791. He received his early education from his father, Elisha Ticknor (1757–1821), who had been principal of the Franklin public school and was a founder of the Massachusetts Mutual Fire Insurance Company, of the system of free primary schools in Boston, and of the first New England savings bank. In 1805 the son entered the junior class at Dartmouth, where he graduated in 1807. During the next three years he studied Latin and Greek with Rev. Dr John Sylvester Gardiner, rector of Trinity, Boston, and a pupil of Dr Samuel Parr. In 1810 Ticknor began the study of law, and he was admitted to the bar in 1813. He opened an office in Boston, but practised for only one year. He went to Europe in 1815 and for nearly two years studed at the university of Göttingen. In 1817 he became Smith professor of French and Spanish languages and literatures (a chair founded in 1816), and professor of belles-lettres at Harvard, and began his work of teaching in 1819 after travel and study in France, Spain and Portugal. During his professorship Ticknor advocated the creation of departments, the grouping of students in divisions according to proficiency, and the establishment of the elective system, and reorganized his own department. In 1835 he resigned his chair, in which he was succeeded in 1836 by Professor H. W. Longfellow; and he was again in Europe in 1835–1838. After his return he devoted himself to the chief work of his life, the history and criticism of Spanish literature, in many respects a new subject at that time even in Europe, there being no adequate treatment of the literature as a whole in Spanish, and both Bouterwek and Sismondi having worked with scanty or second-hand resources. Ticknor developed in his college lectures the scheme of his more permanent work, which he published as the *History of Spanish Literature* (New York and London, 3 vols., 1849). The book is not merely a story of Spanish letters, but, more broadly, of Spanish civilization and manners. The *History* is exhaustive and exact in scholarship, and direct and unpretentious in style. It gives many illustrative passages from representative works, and copious bibliographical references. It was soon translated into Spanish (1851–1857) by de Gayangos and de Vedia; French (1864–1872), a poor version by Magnabal; and German (1852–1867), by N. H. Julius and Ferdinand Wolf. The second American edition appeared in 1854; the third corrected and enlarged, in 1863; the fourth, containing the author's last revision, in 1872, under the supervision of George S. Hillard; and the sixth in 1888. Ticknor had succeeded his father as a member of the Primary School Board in 1822, and held this position until 1825; he was a trustee of the Boston Atheneum in 1823–1832, and was vice-president in 1833; and he was a director (1827–1835) and vice-president (1841–1862) of the Massachusetts Hospital Life Insurance Company, and a trustee of the Massachusetts General Hospital (1826–1830) and of the Boston Provident Institution for Savings (1838–1850), the bank that his father had helped to found. He was especially active in the establishment of the Boston Public Library (1852), and served in 1852–1866 on its board of trustees, of which he was president in 1865. In its behalf he spent fifteen months abroad in 1856–1857, at his own expense, and to it he gave at various times money and books; a special feature of his plan was a free circulating department. He left to the library his own collection, which was particularly strong in Spanish and Portuguese literatures. He died in Boston on the 26th of January 1871.

Ticknor's minor works include, besides occasional reviews and papers, *Syllabus of a Course of Lectures on the History and Criticism of Spanish Literature* (1823); *Outline of the Principal Events in the Life of General Lafayette* (1825); *Remarks on Changes Lately Proposed or Adopted in Harvard University* (1825); *The Remains of Nathan Appleton Haven, with a Memoir of his Life* (1827); *Remarks on the Life and Writings of Daniel Webster* (1831); *Lecture on the Best Methods of Teaching the Living Languages*, delivered, in 1832, before the American Institute of Education; and the *Life of William Hickling Prescott* (1864).

See *Life, Letters and Journals of George Ticknor* (2 vols., 1876), by George S. Hillard and Mrs Anna (Eliot) Ticknor and Miss Anna Eliot Ticknor. This book was edited, with a critical introduction, in 1909, by Ferris Greenslet.

TICKS, the common name for Arachnida (*q.v.*) belonging to the order Acari, of which they constitute the two families, Ixodidae and Argasidae. Collectively the Ixodidae and Argasidae may be distinguished from other Acari by the presence of a median probe, armed with recurved teeth, which project forwards beneath the mouth and between the palpi, and of a conspicuous spiracular area above and usually behind the base of the fourth leg on each side. As compared with the majority of Acari, ticks are of large size, distended female specimens of some of the species measuring half an inch or more in length, while even the newly hatched young can hardly be regarded as microscopical. The integument is tough, leathery or horny. The mouth parts consist of two small retractile mandibles, of a pair of short palpi and of the toothed probe above mentioned. The palpi and probe or hypostome are attached to a movable sclerite or horny plate called the capitulum. The capitulum, with its associated structures, is sometimes called the rostrum, whereas sometimes the term rostrum is restricted to the hypostome alone. It is by means of the hypostome that ticks pierce the integument and firmly adhere to the host whose blood they suck for food. The two families Argasidae and Ixodidae may be distinguished as follows. In the Argasidae the anterior portion of the dorsal surface of the body is extended forwards above the capitulum, so that this structure is concealed from above; the integument is fairly uniformly granular or coriaceous above and below; the palpi are simple and unmodified; there is no sucker beneath the claws in the adult, and there is only a slight structural difference between the sexes. In the Ixodidae the capitulum is not overlapped by a forward extension of the dorsal area, which is smooth and firmly chitinized either in front or all over; the palpi are usually modified, that is to say, their second and third segments are usually excavated internally to form a sheath for the hypostome; there is a distinct sucker beneath the claws and the difference between the sexes is well marked, the males having the dorsal integument thickly and continuously chitinized, whereas in the females only its anterior portion bears a chitinous plate, the rest of the integument being soft to admit of its distension by the blood which is imbibed in quantity by members of this sex. For a longer or shorter period of their lives ticks are parasitic upon vertebrate animals of various kinds; but although the belief that the bite of certain tropical species is poisonous has long been held by the natives of the countries they infest and has been recorded with corroborative evidence by European authors in books of travel, it is only of recent years that accurate information has been acquired of the part played by these Arachnids in transmitting from one host to another protozoal blood-parasites which cause serious or fatal diseases to man and other animals.

Both the Argasidae and Ixodidae contain pathogenic species, of which the best known are the following: *Ornithodoros monbata*, belonging to the Argasidae, and called *bibo* in Uganda, *monbata* in Angola, and *tampan* on the Zambezi, is widely distributed in tropical Africa from Uganda in the north to the Transvaal in the south. It was first recorded as poisonous by Livingstone and is now known to be the carrier of the Spirochaete of relapsing fever in man, known as tick fever. Although Europeans suffer from this disease far more severely than negroes, death seldom follows. The tick especially infests old huts and camping grounds and is nocturnal in habit, spending the day hidden in crevices of the walls or floor and coming out at night to feed upon the sleeping inmates. An allied species, *O. turicala*, occurs in Mexico and Texas, where it causes considerable destruction amongst poultry and is a pest to mankind as well. A similar bad repute attaches to other species in different parts of South America; while *Argas miniatus* has been proved to be the carrier of the Spirochaete causing spirillosis in fowls in Rio Janeiro, and also in New South Wales whither it has been introduced with imported poultry. *Argas persicus* has been introduced in the same way into South Africa from Europe. As its name indicates it was first discovered in Persia, where the belief in the venomous nature of its bite to human beings is both widespread and historical. It is singular that the Argasidae, which are for the most part parasitic upon birds, contain the only species of ticks, especially *O. monbata*, which are known to be seriously harmful to mankind; whereas amongst the Ixodidae no human pathogenic species has been ascertained to exist, although several forms have been proved to be highly destructive to domestic mammals of different species. The most important of these are the following: *Dermacentor reticulatus*, a species widely distributed in Europe, Asia and America, infects dogs in Europe with the Haematozoon causing the disease known as "biliary fever," and has been asserted to be answerable for the so-called spotted or tick fever in man in the Rocky Mountains. The same canine disease results in South Africa from the bite of *Haemaphysalis leachi*. *Amblyomma hebraeum*, the bont or variegated tick of the Cape Colonists, infects sheep with the Sporozoon causing "heart-water" sickness, and in Europe sheep are inoculated with the same disease by another tick, *Rhipicephalus bursa*. The so-called "coast fever" in cattle in South Africa is conveyed by two distinct species of the genus *Rhipicephalus*, namely by *R. appendiculatus* and *R. simus*, which are locally known respectively as the "brown tick" and the "black-pitted tick." Finally *Margaropus annulatus*, of which there are several geographical races, is the carrier of the germ causing the destructive cattle-disease variously known as "Texas" or "red water" fever in America, South Africa and Australia. In the United States alone the annual pecuniary loss in cattle stock occasioned by the ravages of this tick disease was computed in 1907 at one hundred million dollars. With one or two possible exceptions, like *Argas vespertilonis*, which has only been obtained from European bats, no species of tick is known to be confined to a particular host. The common sheep-tick (*Ixodes vicinus*) of England, for example, infects cattle and dogs as well as sheep; and the pathogenetic Ixodidae above mentioned occur parasitically upon other mammals than those to which they convey the diseases specified. Reptiles are infested as well as mammals, and it is no uncommon thing to find specimens of Ixodidae of various kinds adherent to tortoises, snakes and lizards. Ticks belonging to the Ixodidae differ to a certain extent in their life-histories.

Mature males and females are found together upon the same host. Fertilization is effected by the male transferring spermatophores into the genital orifice of the female by means of his proboscis. The gorged and fertilized female quits her hold of the host, and falling to the ground, proceeds after a short delay to lay her eggs in some sheltered spot. The number of eggs laid is enormous, one computation putting it at twenty thousand. After oviposition, which may extend over several weeks, the female dies. The newly-hatched young has only three pairs of legs and is without spiracular and genital orifices. These young, or larvae as they are called, after the integument has hardened by exposure to the air, climb up the stalks of grain or herbage and cling with outstretched legs waiting for passing animals. They seize hold of the first that brushes by, and crawling to a suitable place become engorged with blood. After about a week's feeding they drop to the ground, lie dormant for a month, during which time they acquire their fourth pair of legs and spiracles, and, moulting, emerge from their old skin as *nymphs*. Nymphs repeat the behaviour of the larvae, and finally moult into the adult, showing the generative orifice, which is the mark of maturity. The adult secures a host in the same way as the young. Both sexes feed upon blood; whereas the male alters but little in appearance, the female becomes enormously distended.

From the foregoing epitome which applies to many species, *Rhipicephalus appendiculatus* for example, it is evident that every individual tick has to find a host on three occasions, namely, as larva, nymph and adult. In *R. bursa*, however, the moult that

transforms the larva into the nymph takes place on the host, and in *Margaropus annulatus* the transformation of larva into nymph and nymph into adult is effected without the temporary sojourn on the ground. Another species, *Hyalomma aegyptium*, the so-called camel-tick of Egypt and Arabia, is alleged to be parasitic only in its mature stage. Again, in *Ornithodorus monbata*, which is parasitic apparently only at night, the young does not hatch from the egg until it has attained the nymphal stage.

It is an interesting and important fact that the newly hatched young of certain species, *Margaropus annulatus* for instance, before it has fed, if produced by a female carrying the germs of spirillosis, can infect healthy organisms with the disease. From this it is evident that the Spirochaetes pass directly from the mother tick to her offspring.

Duration of life in ticks depends upon the conditions of their existence. Under favourable conditions, when food is obtainable, growth is rapid, the time from the hatching of the young until it reaches maturity and dies after oviposition being, for example, about eleven weeks in *R. appendiculatus* and only about three weeks in *M. annulatus*. On the other hand, when food is not obtainable, life may be indefinitely prolonged if the tick be guarded from enemies and from atmospheric conditions inimical to existence. Examples of *Ixodes vicinis* have been kept for two years and three months without feeding, and specimens of *Argas persicus* were still alive after four years' starvation. (R. I. P.)

TICONDEROGA, a village in the township of Ticonderoga, Essex county, New York, U.S.A., on the outlet of Lake George, 100 m. by rail N. by E. of Albany. Pop. (1890), 2267; (1900), 1911; (1905), 1749; (1910), 2475. Ticonderoga is served by the Delaware & Hudson and the Rutland railways. The water from Lake George falls here about 30 ft., providing water-power, and among the manufactures are paper pulp, paper-making machinery and lumber. Flake graphite was discovered in this vicinity as early as 1815, and for years two mines (with quartzite veins, respectively 1–5 and 2–15 ft. thick) at Ticonderoga were the principal source of supply of good crystalline graphite. Commanding a portage on the line of water communication between Canada and the English colonies, Ticonderoga was a place of considerable strategic importance during the Seven Years' War. On a commanding elevation overlooking the present village and Lake Champlain the French began building a fort of earth and timber in 1755 and called it Fort Carillon; later it was named Fort Ticonderoga. Sir William Johnson led an expedition in the same year against this fort and Crown Point; though he failed to capture the forts he defeated Baron Ludwig August Dieskau in the battle of Lake George and erected at the head of the lake Fort William Henry, which was captured by the marquis de Montcalm in 1757. On the 8th of July 1758 less than 4000 Frenchmen were confronted at Fort Carillon by about 6000 British regulars and 10,000 provincials under Lieut.-General James Abercrombie and Brigadier-General George A. Howe, but Howe, the controlling spirit of the British force, had been killed on the 6th of July, and Abercrombie, after an ineffective attack which cost him nearly 2000 men killed or wounded, retreated. In 1758, however, when Montcalm had gone to Quebec to oppose Wolfe and a force of only 400 men was left at Ticonderoga, Lord Amherst with 11,000 men invested it, and on the 26th of July the garrison blew up and abandoned the fortifications. At the beginning of the War of Independence, on the 10th of May 1775, the fort was surprised and captured by Ethan Allen. It was recovered by the British on the 5th of July 1777, during Burgoyne's campaign, was abandoned immediately after Burgoyne's surrender in October 1777, but was re-occupied by the British in 1780. After the close of the war it was allowed to fall into ruins. In 1909, on the occasion of the tercentenary celebration of the discovery of Lake Champlain, the restoration of the fort was begun under the direction of the owner of the site. The settlement of this region was begun soon after the close of the Seven Years' War, and the township of Ticonderoga was set apart from the township of Crown Point in 1804. The village of Ticonderoga was incorporated in 1889. The name "Ticonderoga" is a corruption of an Indian word said to mean "sounding waters."

TIDE (O. Eng. *tīd*, cf. Ger. *Zeit*, time or season, connected with root of Sanskrit *a-diti*, endless), a term used generally for the daily rising and falling of the water of the sea, but more specifically defined below.

I.—General Account of Tides and Tidal Theories

§. 1. *Definition of Tide.*—When, as occasionally happens, a ship in the open sea meets a short succession of waves of unusual magnitude, we hear of tidal waves; and the large wave caused by an earthquake is commonly so described. But the use of the adjective "tidal" appears to us erroneous in this context, for the tide is a rising and falling of the water of the sea produced by the attraction of the sun and moon. A rise and fall of the sea produced by a regular alternation of day and night breezes, by regular rainfall and evaporation, or by any influence which the moon may have on the weather cannot strictly be called a tide. Such alterations may be inextricably involved with the rise and fall of the true astronomical tide, but we shall here distinguish them as meteorological tides. It is well known that there are strongly marked diurnal and semi-diurnal inequalities of the barometer due to the sun's heat, and they may be described as atmospheric meteorological tides.[1] These movements both in the case of the sea and in that of the atmosphere are the result of the action of the sun, as a radiating body, on the earth. True astronomical tides in the atmosphere would be shown by a regular rise and fall in the barometer, but such tides are undoubtedly very minute, and we shall not discuss them in this article, merely referring the reader to the *Mécanique céleste* of Laplace, bks. i. and xiii. We shall in the present article extend the term "tide" to denote an elastic or viscous periodic deformation of a solid or viscous globe under the action of tide-generating forces.

Atmospheric Tides.

§ 2. *General Description of Tidal Phenomena.*[2]—If we live by the sea or on an estuary, we see that the water rises and falls nearly twice a day; speaking more exactly, the average interval from high-water to high-water is about $12^h\ 25^m$, so that the average retardation from day to day is about 50^m. The times of high-water are then found to bear an intimate relation with the moon's position. Thus at Ipswich high-water occurs when the moon is nearly south, at London Bridge when it is south-west, and at Bristol when it is east-south-east. For a very rough determination of the time of high-water it is sufficient to add the solar time of high-water on the days of new and full moon (called the "establishment of the port") to the time of the moon's passage over the meridian, either visibly above or invisibly below the horizon. The interval between the moon's passage over the meridian and high-water varies sensibly with the moon's age. From new moon to first quarter, and from full moon to third quarter (or rather from and to a day later than each of these phases), the interval diminishes from its average to a minimum, and then increases again to the average; and in the other two quarters it increases from the average to a maximum, and then diminishes again to the average.

Variability of Interval after Moon's Transit.

The range of the rise and fall of water is also subject to great variability. On the days after new and full moon the range of tide is at its maximum, and on the day after the first and third quarter at its minimum. The maximum is called "spring tide" and the minimum "neap tide," and the range of spring tide is usually nearly three times as great as that of neap tide. At many ports, however, especially non-European ones, two successive high-waters are of unequal heights, and the law of variability of the difference is somewhat complex; a statement of that law will be easier when we come to consider tidal theories. In considering any single oscillation of water level we find, especially in estuaries, that the interval from high to low-water is longer than that from low to high-water, and the difference between these two intervals is greater at springs than at neaps.

Spring and Neap.

In a river the current continues to run up stream for some considerable time after high-water is attained and to run down similarly after low-water. Much confusion has been occasioned by the indiscriminate use of the term "tide" to denote a tidal current and a rise of water, and it has often been incorrectly inferred that high-water must have been attained at the moment of cessation of the upward current. The distinction between "rising and falling" and "flowing and ebbing" must be maintained in rivers, whilst it is unnecessary at the seaboard. If we examine the progress of the tide-wave up a river we find that high-water occurs at the sea earlier than higher up. If, for instance, on a certain day it is high-water at Margate at noon, it is high-water at Gravesend at a quarter past two, and at London Bridge a few minutes before three. The interval from low to high-water diminishes also as we go up the river; and at some distance up certain rivers—as, for example, the Severn—the rising water spreads over the flat sands in a roaring surf and travels up the river almost like a wall of water. This kind of sudden rise is called a "bore"[3] (*q.v.*). In other cases where the difference between the periods of rising and falling is considerable there are, in each high-water, two or three rises and falls. A double high-water exists at Southampton.

River Tides.

Distinction of Rise and Fall from Flood and Ebb.

When an estuary contracts considerably, the range of tide becomes largely magnified as it narrows; for example, at the

[1] Lord Kelvin shows that the attraction of the sun on these tides must produce an excessively small acceleration of the earth's rotation. See *Société de physique* (September 1881), or *Proc. Roy. Soc. Edin.* (1881–1882), p. 396.

[2] Founded on G. B. Airy's "Tides and Waves," in *Ency. Metrop.*

[3] See a series of papers bearing on this kind of wave by Sir W. Thomson (Lord Kelvin) in *Phil. Mag.* (1886–1887).

Augmentation of Height in Estuaries. entrance of the Bristol Channel the range of spring tides is about 18 ft., and at Chepstow about 50 ft. This augmentation of the height of the tide-wave is due to the concentration of the energy of motion of a large mass of water into a narrow space. At oceanic ports the tidal phenomena are much less marked, the range of tide being usually only 2 or 3 ft., and the interval from high to low-water sensibly equal to that from low to high-water. The changes from spring to neap tide and the relation of the time of high-water to the moon's transit are, however, the same both on the open coast and in rivers.

Land-locked Seas. In long and narrow seas, such as the English Channel, the tide in mid-channel follows the same law as at a station near the mouth of a river, rising and falling in equal times; the current runs in the direction analogous to up stream for three hours before and after high-water, and down stream for the same period before and after low-water. But near the sides of channels and near the mouths of bays the changes of the currents are very complex; and near the headlands separating two bays there is usually at certain times a very swift current, termed a "race."

In inland seas, such as the Mediterranean, the tides are nearly insensible except at the ends of long inlets. Thus at Malta the tides are not noticed by the ordinary observer, whilst at Venice they are conspicuous.

Wind. The effect of a strong wind on the height of tide is generally supposed to be strongly marked, especially in estuaries. In the case of an exceptional gale, when the wind veered round appropriately, Airy states[1] that the water has been known to depart from its predicted height at London by as much as 5 ft. The effect of wind will certainly be different at each port. The discrepancy of opinion on this subject appears to be great—so much so that we hear of some observers concluding that the effect of the wind is insensible. *Atmospheric Pressure.* Variations in barometric pressure also cause departures from the predicted height of water, high barometer corresponding to decrease of height of water. Roughly speaking, an inch of the mercury column will correspond to about a foot of water, but the effect seems to vary much at different ports.[2]

Mariners and hydrographers make use of certain technical terms which we shall now define and explain.

Technical Terms used by Sailors. The "establishment of the port," already referred to above, is the average interval which elapses between the moon's transit across the meridian, at full moon and at change of moon, and the occurrence of high-water. Since at these times the moon crosses the meridian at twelve o'clock either of day or night, the "establishment" is the hour of the clock of high-water at full and change.

It has already been remarked that spring tide occurs at most places a day or a day and a half after full and change of moon. Now it is more important in the theory of the tides to know what occurs at spring tide than what occurs at full and change of moon. Thus the term "the corrected establishment of the port" is used to denote the interval in hours elapsing at spring tide between moon's transit and high-water. The difference between the ordinary and the corrected establishments is of small amount. At any other state of the moon, except full and change, the "interval" or "lunitidal interval" means the interval between the moon's upper or lower transit and high-water.

The average interval elapsing between full or change of moon and spring tide is called the "age of the tide"; as already remarked this interval is commonly about a day or a day and a half, but it may be twice as great in some places. The use of this term arises from the idea that spring tides are generated at some undefined place exactly at full or change of moon, and take an interval of time denoted the "age" to reach the place of observation. The term is not altogether satisfactory, since it implies a theory, but it must be referred to as in general use.

The average height at spring tide between high and low-water marks is called "the spring rise"; the similar height at neap tides is, however, called "the neap range." "Neap rise" is used to mean the average height between high-water of neap tides and low-water of spring tides. Thus both at springs and neaps the term "rise" refers to the rise above the level of low-water at spring tide. French hydrographers call half the spring rise "the unit of height."

[1] Airy, "Tides and Waves." [2] Ibid. §§ 572–573.

The "diurnal inequality" of the tide denotes the fact that successive high-waters and successive low-waters are unequal to one another. In England the diurnal inequality scarcely exists.

The practice of the British admiralty is to refer their soundings and tide tables to "mean low-water mark of ordinary spring tides." This datum is found by taking the mean of all the available observations of spring tides, excluding, however, from the mean any spring tides which may be considered abnormal. The admiralty datum is not, then, susceptible of exact scientific definition; but when it has once been fixed with reference to a bench-mark ashore it is expedient to adhere to it, by whatever process it was first fixed.[3]

When new tidal stations are established in India the datum of reference has, since about 1885, been "Indian low-water mark," which is defined as being below mean sea-level by the sum of the semi-ranges of the tides M_2, S_2, K_1, O (see §§ 24, 25 on Harmonic Analysis below).

In ordinary parlance sailors very commonly use the term "tide" when they mean what may be more accurately described as a tidal current.

§ 3. *Tidal Observation: the Tide-gauge.*—Tidal prediction is only possible when accurate observations have been made of the phenomena to be predicted; and the like is true of verification after prediction. It was formerly thought sufficient to note the heights of the water at high and low-water, together with the times of those events, and the larger part of the observations which exist are still of this character, but complete investigation of the law of tidal oscillations demands that the height of the water should be measured at other times than at high and low-water.

Tide-pole. With whatever degree of thoroughness it is proposed to observe the tides the procedure is much the same. The simplest sort of observation is to note the height of the water on a graduated staff fixed in the sea, with such allowance as may be possible for wave motion. It is, however, far preferable to sink a tube into the sea into which the water penetrates through small holes; and the wave motion is thus annulled. In the calm water inside the tube there lies a float, to which is attached a cord passing over a pulley and counterpoised at the end. The motion of the counterpoise against a scale is observed. In either case the observations may be made every hour, or the times and heights of high and low-water may be noted.

In more careful observations than those referred to above the tidal record is automatic and continuous and is derived by means of an instrument called a tide-gauge.

Tide-gauge. This gauge should be placed in a place where we may obtain a fair representation of the oscillation of the surrounding sea. In such a site a well or tank is built on the shore communicating by a channel with the sea at about 10 ft. below lowest low-water mark. In some cases an artificially constructed well may be dispensed with, where some lagoon or pool exists so near to the sea as to permit junction with the sea by means of a channel below low-water mark. At any rate we suppose that water is provided rising and falling with the tide, without much wave-motion. A cylindrical float, usually a hollow metallic box or a block of greenheart wood, hangs and floats in the well, and is of such density as just to sink without support. The float hangs under very light tension by a platinum wire, or by a metallic ribbon, or by a chain. The suspension wire is wrapped round a wheel, and imparts to it rotation proportional to the rise and fall of tide. By a simple gearing this wheel drives another, by which the range is reduced to any convenient extent. A fine wire wound on the final wheel of the train drags a pencil or pen up and down or to and fro proportionately to the tidal oscillations. The pencil is lightly pressed against a drum, which is driven by clockwork so as to make one revolution per day. The pen leaves its trace or tide-curve on paper wrapped round the drum. The paper is fixed to the drum with the edges of the paper at the XII o'clock line, and the record of a fortnight may be taken without change of paper. An example of a tide-curve for Apollo Bunder, Bombay, from the 1st to the 15th of January 1884, is shown in fig. 1.

The curves are to be read from right to left, and when we reach the left-hand edge of the paper, we re-enter again at the same height on the right-hand edge. The numbers on the successive curves denote the days of the month.

We have chosen an example from a sub-tropical region because it illustrates the remarkable regularity of the tides in a region where the weather is equable. Further, if the reader will note the successive high-waters or low-waters which follow one another on any one day, he will see a strongly marked "diurnal inequality," which would have been barely perceptible in a European tide-curve.

[3] See J. N. Shoolbred on datum levels, *Brit. Assoc. Reports* (1879).

§4. *Tide-Tables and the Degree of Accuracy in Tidal Prediction.*[1]—The connexion between the tides and the movements of the moon and sun is so obvious that tidal predictions were regularly made and published long before mathematicians had devoted their attention to them; and these predictions attained considerable success, although they were founded on empirical methods. During the 18th century, and even in the earlier part of the 19th, the art of prediction was regarded as a valuable family secret to be jealously guarded from the public. The best example of this kind of tide-table was afforded by Holden's tables for Liverpool, founded on twenty years of observation by a harbour-master named Hutchinson.[2]

Empirical Tide-tables.

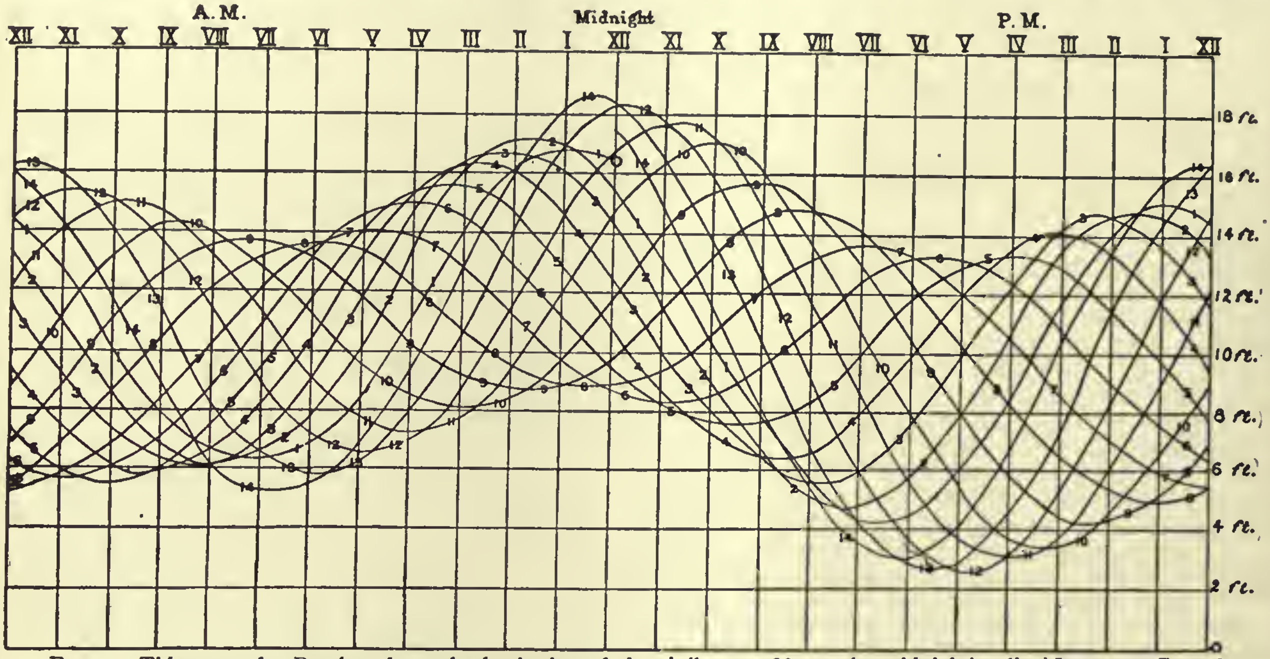

FIG. 1.—Tide-curve for Bombay from the beginning of the civil year 1884 to the midnight ending Jan. 14, 1884, or from 12^h Dec. 31, 1883, to 12^h Jan. 14, 1884, astronomical time. *Zero of Gauge*

About 1832 the researches of W. Whewell and of Sir John Lubbock (senior) pointed the way to improvement on the empirical tables prepared by secret methods, and since that time the preparation of tide-tables has become a branch of science.

A perfect tide-table would tell the height of the water at the place of observation at every moment of the day, but such a table would be cumbrous; it is therefore usual to predict only the times and heights of high-water and of low-water. The best kind of tide-table contains definite forecasts for each day of a definite year, and we may describe it as a special table. Although the table is only made for one definite place, yet it is often possible to give fairly accurate predictions for neighbouring ports by the application of corrections both for time and height. Special tide-tables are published by all civilized countries for their most important harbours.

Prediction for each Day.

But there is another kind of table, which we may describe as a general one, where the heights and times are given by reference to the time at which the moon crosses the meridian. Although such a table is only applicable to a definite place, yet it holds good for all time. In this case it is necessary to refer to the *Nautical Almanac* for the time of the moon's transit, and a simple calculation then gives the required result. In a general tide-table the heights and times are tabulated according to the hour of the clock at which the moon will cross the meridian at the place of observation, distinguishing between the visible and invisible transits. Certain simple corrections have also to be applied. A considerable degree of elaboration has to be given to the table, in order that it may give accurate results, and it would occupy some half-dozen to a dozen pages of a book, its extension varying according to the degree of accuracy aimed at. It might occupy about five minutes to extract a prediction from the more elaborate form of such a table. There are many ports of considerable commercial importance where, nevertheless, it would hardly be worth while to incur the great and repeated expenditure involved in the publication of special tables. But this kind of elaborate general table has been used in few cases,[3] and the information furnished to mariners usually consists either of a full prediction for every day of a future year, or of a meagre statement as to the average rise and interval, which must generally be almost useless.

Prediction by Reference to Time of Moon's Transit.

The success of tidal predictions varies much according to the place of observation. In stormy regions the errors are often considerable, and the utmost that can be expected of a tide-table is that it shall be correct with a steady barometer and in calm weather. But such conditions are practically non-existent, and therefore errors are inevitable.

Meteorological Disturbance of Prediction.

Notwithstanding these perturbations, tide-tables are usually of surprising accuracy even in northern latitudes; this may be seen from the following table showing the results of comparison between prediction and actuality at Portsmouth. The importance of the errors in height depends, of course, on the range of the tide; it is well, therefore, to note that the average ranges of the tide at springs and neaps are 13 ft. 9 in. and 7 ft. 9 in. respectively.

Amount of Error at Portsmouth.

Prediction at such a place as Portsmouth is difficult, on account of the instability of the weather, but, on the other hand, the tides in themselves are remarkably simple in character. Let us now turn to such a port as Aden, where the weather is very uniform, but the tides very complex on account of the large diurnal inequality, which frequently obliterates one of two successive high-waters. The short series of comparisons between actuality and prediction which we give below may be taken as a fair example of what would hold good when a long series is examined. The results refer to the intervals 10th of March to the 9th of April and the 12th of November to the 12th of December 1884. In these two periods there should have been 118 high waters, but the tide-gauge failed to register on one occasion,

Amount of Error at Aden.

[1] References may be given to two papers by G. H. Darwin on this subject, viz. "Tidal Prediction," *Phil. Trans.*, A. (1891) pp. 159–229; and "An apparatus for facilitating the reduction of tidal observations," *Proc. Roy. Soc.* (1892), vol. lii. For a general account without mathematics see Darwin's *Tides*, &c.; this section is founded on chs. xiii. and xiv. of that book. For mathematical methods see Maurice Lévy, *Théorie des marées* (Paris, 1898).

[2] Whewell, *History of Inductive Sciences*, ii. 248; Darwin's *Tides*, *&c.*, ch. iv.

[3] Darwin, "Tidal Prediction," quoted above. This kind of table has been applied with some success at Cairns in North Queensland, where there is a large diurnal inequality.

so that one comparison is lost. We thus have 117 cases to consider, but on one occasion the diurnal inequality obliterated a high-water, leaving 116 actual comparisons. The maximum range of the tide at Aden is 8 ft. 6 in., and this serves to give a standard of importance for the errors in height.

Table of Errors in the Prediction of High-Water at Portsmouth in the months of January, May and September 1897.

Time.		Height.

It would be natural to think that when a prediction is erroneous by as much as fifty-seven minutes it is a very bad one, but such a conclusion may be unjust. There was one case in which the high-water was completely obliterated by the diurnal inequality, but there were many others in which there was nearly complete obliteration, so that the water stood nearly stagnant for several hours. A measure of the degree of stagnation is afforded by the amount of rise from low to high-water. Now, on examining all the eleven cases where the error of time was equal to or over twenty minutes, we find five cases in which the range from low to high-water was less than 8 in., and these include the errors of fifty-six and of fifty-seven minutes. There is one case of a rise of 13 in. with an error of thirty-six minutes; one case of a rise of 17 in. with an error of twenty-two minutes; one of 19 in. rise with thirty-three minutes error. The remaining three cases have rises of 2 ft. 10 in., 3 ft. 9 in., 3 ft. 11 in., and errors of twenty-two, twenty-three, twenty minutes. Thus all the very large errors of time correspond with approximate stagnation, and are unimportant. It is fair to conclude, therefore, that the predictions as to time are very good. The predictions as to height are obviously good, for more than half were within 1 in., and only eleven had an error of as much as 4 in.

When it is considered that the incessant variability of the tidal forces, the complex outlines of the coast, the depth of the sea, the earth's rotation and the perturbations by meteorological influences are all involved, it should be admitted that the success of tidal prediction is remarkable. If further evidence were needed, we might appeal to tidal prediction as a convincing proof of the truth of the theory of gravitation.

§ 5. *General Explanation of the Cause of Tides.*—The moon attracts every particle of the earth and ocean, and by the law of gravitation the force acting on any particle is directed towards the moon's centre, and is jointly proportional to the masses of the particle and of the moon, and inversely proportional to the square of the distance between the particle and the moon's centre. If we imagine the earth and ocean subdivided into a number of small portions or particles of equal mass, then the average, both as to direction and intensity of the forces acting on these particles is equal to the force acting on that particle which is at the earth's centre. For there is symmetry about the line joining the centres of the two bodies, and, if we divide the earth into two portions by an ideal spherical surface passing through the earth's centre and having its centre at the moon, the portion remote from the moon is a little larger than the portion towards the moon, but the nearer portion is under the action of forces which are a little stronger than those acting on the farther portion, and the resultant of the weaker forces on the larger portion is exactly equal to the resultant of the stronger forces on the smaller. If every particle of the earth and ocean were being urged by equal and parallel forces there would be no cause for relative motion between the ocean and the earth. Hence it is the departure of the force acting on any particle from the average which constitutes the tide-generating force. Now it is obvious that on the side of the earth towards the moon the departure from the average is a small force directed towards the moon; and on the side of the earth away from the moon the departure is a small force directed away from the moon. Also these two departures are very nearly equal to one another, that on the near side being so little greater than that on the other that we may neglect the excess. All round the sides of the earth along a great circle perpendicular to the line joining the moon and earth the departure is a force directed inwards towards the earth's centre. Thus we see that the tidal forces tend to pull the water towards and away from the moon, and to depress the water at right angles to that direction.

Tide-generating Forces.

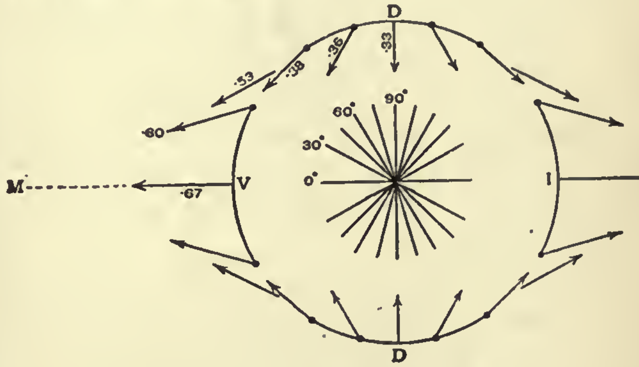

FIG. 2.—Tide-generating Force.

In fig. 2 this explanation is illustrated graphically. The relative magnitudes of the tidal forces are given by the numbers on the figure. M is the direction of the moon, V the centre of the hemisphere of the earth at which the man in the moon would look, I the centre of the hemisphere which would be invisible to him, DD are the sides of the earth where the tidal force is directed towards the earth's centre. The outward forces at V and I are exactly double the inward forces at D and D.

If it were permissible to neglect the earth's rotation and to consider the system as at rest, we should find that the water was in equilibrium when elongated into a prolate ellipsoidal or oval form with its longest axis directed towards and away from the moon.

Theory of Equatorial Canal on Earth.

But it must not be assumed that this would be the case when there is motion. For, suppose that the ocean consisted of a canal round the equator, and that an earthquake or any other cause were to generate a great wave in the canal, this wave would travel along it with a velocity dependent on the depth. If the canal were about 13 miles deep the velocity of the wave would be about 1000 miles an hour, and with depth about equal to the depth of our seas the velocity of the wave would be about half as great. We may conceive the moon's tide-generating force as making a wave in the canal and continually outstripping the wave it generates, for the moon travels along the equator at the rate of about 1000 miles an hour, and the sea is less than 13 miles deep. The resultant oscillation of the ocean must therefore be the summation of a series of partial waves generated at each instant by the moon and always falling behind her, and the aggregate wave, being the same at each instant, must travel 1000 m. an hour so as to keep up with the moon.

Now it is a general law of frictionless oscillation that, if a slowly varying periodic force acts on a system which would oscillate quickly if left to itself, the maximum excursion on one side of the equilibrium position occurs simultaneously with the maximum force in the direction of the excursion; but, if a quickly varying periodic force acts on a system which would oscillate slowly if left to itself, the maximum excursion on one side of the equilibrium position occurs simultaneously with the maximum force in the direction opposite to that of the excursion. An example of the first is a ball hanging by a short string, which we push slowly to and fro; the ball will never quit contact with the hand, and will agree with its excursions. If, however, the ball is hanging by a long string we can play at battledore and shuttlecock with it, and it always meets our blows. The latter is the analogue of the tides, for a free wave in our shallow canal goes slowly, whilst the moon's tide-generating action goes quickly. Hence when the system is left to settle into steady oscillation it is low-water under and opposite to the moon, whilst the forces are such as to tend to make high-water at those times.

Tides Inverted.

If in this case we consider the moon as revolving round the earth, the water assumes nearly the shape of an oblate spheroid or orange-shaped body with the shortest axis pointed to the moon. The rotation of the earth in the actual case introduces a complexity which it is not easy to unravel by general reasoning. We can see, however, that if water moves from a lower to a higher latitude it arrives at the higher latitude with more velocity from west to east than is appropriate to its latitude, and it will move accordingly on the earth's surface. Following out this conception, we see that an oscillation of the water to and fro between south and north must be accompanied by an eddy. The solution of the difficult problem involved in working out this idea will be given below.

The conclusion at which we have arrived about the tides of an equatorial canal is probably more nearly true of the tides of a globe partially covered with land than if we were to suppose the ocean at each moment to assume the prolate figure of equilibrium. In fact, observation shows that it is more nearly low-water than high-water when the moon is on the meridian. If we consider how the oscillation of the water would appear to an observer carried round with the earth, we see that he will have low-water twice in the lunar day, somewhere about the time when the moon is on the meridian, either above or below the horizon, and high-water half-way between the low waters.

If the sun be now introduced we have another similar tide of about half the height, and this depends on solar time, giving low-water somewhere about noon and midnight. The superposition of the two, modified by friction and by the interference of land, gives the actually observed aggregate tide, and it is clear that about new and full moon we must have spring tides and at quarter moons neap tides, and that (the sum of the lunar and solar tide-generating forces being about three times their difference) the range of spring tide will be about three times that of neap tide.

Sun's Influence.

So far we have supposed the luminaries to move on the equator; now let us consider the case where the moon is not on the equator. It is clear in this case that at any place the moon's zenith distance at the upper transit is different from her nadir distance at the lower transit. But the tide-generating force is greater the smaller the zenith or nadir distance, and therefore the forces are different at successive transits. This was not the case when the moon was deemed to move on the equator. Thus there is a tendency for two successive lunar tides to be of unequal heights, and the resulting inequality of height is called a "diurnal tide." This tendency vanishes when the moon is on the equator; and as this occurs each fortnight the lunar diurnal tide is evanescent once a fortnight. Similarly in summer and winter the successive solar tides are generally of unequal height, whilst in spring and autumn this difference is inconspicuous.

Diurnal Tides.

One of the most remarkable conclusions of Laplace's theory of the tides, on a globe covered with ocean to a uniform depth, is that the diurnal tide is everywhere non-existent. But this hypothesis differs much from the reality, and in fact at some ports, as for example Aden, the diurnal tide is so large that during two portions of each lunation there is only one great high-water and one great low-water in each twenty-four hours, whilst in other parts of the lunation the usual semi-diurnal tide is observed.

Evanescent in Ocean of Uniform Depth.

§ 6. *Progress of the Tide-wave over the Ocean and in the British Seas.*—Sufficient tidal data would give the state of the tide at every part of the world at the same instant of time, and if the tide wave is a progressive one, like such wave as we may observe travelling along a canal, we should be able to picture mentally the motion of the tide-wave over the ocean and the successive changes in the height of water at any one place. But we are not even sure that the wave is progressive, for in some oceans, such as perhaps the Atlantic, the motion may be only a see-saw about some line in mid-ocean—up on one side and down on the other; or it may more probably be partly a progressive wave and partly a see-saw or stationary oscillation. In contracted seas the wave is undoubtedly predominantly progressive in character, but too little is known to enable us to speak with any confidence as to wider seas.

Whewell and Airy, while acknowledging the uncertainty of their data, made the attempt to exhibit graphically the progress of the tide-wave over a large portion of the oceans of the world. In the first edition of this article (*Ency. Brit.*, 9th ed.) we reproduced their chart. But, since doubts as to its correctness have gradually accumulated, we think it more prudent to refrain from reproducing it again.[1]

As we have already indicated, the tide in British seas has mainly a progressive character, and the general march of the wave may be exhibited on a chart by what are called cotidal lines. If at the full and change of moon we draw lines on the sea through all the places which have high-water simultaneously, and if we mark such lines successively XII, I, II, &c., being the Greenwich time of high-water along each line, we shall have a succession of lines which show the progress of the wave from hour to hour.

For phases of the moon, other than full and change, the numbers may be taken to represent the interval in hours after the moon's transit, either visible or invisible, until the occurrence of high water. But for these other phases of the moon the interval varies by as much as one hour in excess or defect of the number written on any of the lines. Thus when the moon is about five days old, or five days past full, the numbers must all be reduced by about one hour so that I, II, III, &c., will then be replaced by XII, I, II, &c.; and when the moon is about ten days old, or ten days past full, the numbers must all be augmented by about one hour, and will read II, III, IV, &c. However, for a rough comprehension of the tides in these seas it is unnecessary to pay attention to this variation of the intervals.

Airy in his "Tides and Waves" gives such a chart for Great Britain and the North Sea, and he attempts to complete the cotidal lines conjecturally across the North Sea to Norway, Denmark and the German coast. In this case, as in the more ambitious attempt referred to above, further knowledge has led to further doubt. We therefore give in fig. 3 Berghaus's modification of Airy's Chart,[2] abandoning the attempt to draw complete cotidal lines. In this chart we can watch, as it were, the tide-wave running in from the Atlantic, passing up the Bristol Channel and Irish Sea, travelling round the north of Scotland and southward along the east coasts of Scotland and England. Another branch comes up the Channel, and meets the wave from the north off the Dutch coast. The Straits of Dover are so narrow, however, that it may be doubted whether

[1] Portion of Airy's Chart (*Encycl. Metrop.*, art. "Tides and Waves") is given in Darwin, *Tides and Kindred Phenomena in the Solar System.*

[2] Berghaus's *Physical Atlas* (1891), pt. ii., "Hydrography."

the tides on the English coasts would be profoundly modified if the Straits were completely closed.

It will be noticed that between Yarmouth and Holland the cotidal lines cross one another. Such an intersection of lines is in general impossible; it is indeed only possible if there is a region in which the water neither rises nor falls, because at such a place the cotidal line ceases to have a definite meaning. A set of observations by Captain Hewitt, R.N., made in 1840, appears to prove the existence of a region of this kind at the part of the chart referred to.

FIG. 3.—Cotidal Lines in British Seas.

§ 7. *Historical Sketch.*[1]—The writings of various Chinese, Arabic and Icelandic authors show that some attention was paid by them to the tides, but the several theories advanced are fantastic. It is natural that the writings of the classical authors of antiquity should contain but few references to the tides, for the Greeks and Romans lived on the shores of an almost tideless sea. Nevertheless, Strabo quotes from Posidonius a clear account of the tides on the Atlantic coast of Spain, and connects the tides correctly with the motion of the moon. He also gives the law of the tide in the Indian Ocean as observed by Seleucus the Babylonian, and the passage shows that Seleucus had unravelled the law which governs the diurnal inequality of the tide in that sea.

We shall not give any details as to the medieval speculations on the tides, but pass on at once to Newton, who in 1687 laid the foundation for all that has since been added to the theory of the tides when he brought his grand generalization of universal gravitation to bear on the subject. Johann Kepler had indeed at an early date recognized the tendency of the water of the ocean to move towards the centres of the sun and moon, but he was unable to submit his theory to calculation. Galileo expresses regret that so acute a man as Kepler should have produced a theory which appeared to him to reintroduce the occult qualities of the ancient philosophers. His own explanation referred the phenomenon to the rotation and orbital motion of the earth, and he considered that it afforded a principal proof of the Copernican system.

Kepler.

In the 19th corollary of the 66th proposition of bk. i. of the *Principia*, Sir Isaac Newton introduces the conception of a canal circling the earth, and he considers the influence of a satellite on the water in the canal. He remarks that the movement of each molecule of fluid must be accelerated in the conjunction and opposition of the satellite with the molecule, that is to say when the molecule, the earth's centre and the satellite are in a straight line, and retarded in the quadratures, that is to say when the line joining the molecule and the earth's centre is at right angles to the line joining the earth's centre and the satellite. Accordingly the fluid must undergo a tidal oscillation. It is, however, in propositions 26 and 27 of bk. iii. that he first determines the tidal force due to the sun and moon. The sea is here supposed to cover the whole earth and to assume at each instant a figure of equilibrium, and the tide-generating bodies are supposed to move in the equator. Considering only the action of the sun, he assumes that the figure is an ellipsoid of revolution with its major axis directed towards the sun, and he determines the ellipticity of such an ellipsoid. High solar tide then occurs at noon and midnight, and low-tide at sunrise and sunset. The action of the moon produces a similar ellipsoid, but of greater ellipticity. The superposition of these ellipsoids gives the principal variations of the tide. He then proceeds to consider the influence of latitude on the height of tide, and to discuss other peculiarities of the phenomenon. Observation shows, however, that spring tides occur a day and a half after full and change of moon, and Newton falsely attributed this to the fact that the oscillations would last for some time if the attractions of the two bodies were to cease.

Newton.

The Newtonian hypothesis, although it fails in the form which he gave to it, may still be made to represent the tides if the lunar and solar ellipsoids have their major axes always directed toward a fictitious moon and sun, which are respectively at constant distances from the true bodies; these distances are such that the full and change of the fictitious moon as illuminated by the fictitious sun occur about a day or a day and a half later than the true full and change of moon. In fact, the actual tides may be supposed to be generated directly by the action of the real sun and moon, and the wave may be imagined to take a day and a half to arrive at the port of observation. This period has accordingly been called "the age of the tide." In what precedes the sun and moon have been supposed to move in the equator; but the theory of the two ellipsoids cannot be reconciled with the truth when they move, as in actuality, in orbits inclined to the equator. At equatorial ports the theory of the ellipsoids would at spring tides give morning and evening high waters of nearly equal height, whatever the declinations of the bodies. But at a port in any other latitude these high waters would be of very different heights, and at Brest, for example, when the declinations of the bodies are equal to the obliquity of the elliptic, the evening tide would be eight times as great as the morning tide. Now observation shows that at this port the two tides are nearly equal to one another, and that their greatest difference is not a thirtieth of their sum. Newton here also offered an erroneous explanation of the phenomenon.

"Astres Fictifs."

Age of Tide.

In 1738 the Academy of Sciences of Paris offered, as a subject for a prize, the theory of the tides. The authors of four essays received prizes, viz. Daniel Bernoulli, Leonhard Euler, Colin Maclaurin and Antoine Cavalleri. The first three adopted not only the theory of gravitation, but also Newton's method of the superposition of the two ellipsoids. Bernoulli's essay contained an extended development of the conception of the two ellipsoids, and, under the name of the equilibrium theory, it is commonly associated with his name. Laplace gives an account and critique of the essays of Bernoulli and Euler in the *Mécanique céleste.* The essay of Maclaurin presented little that was new in tidal theory, but is notable as containing certain important theorems concerning the attraction of ellipsoids. In 1746 Jean-le-Rond D'Alembert wrote a paper in which he treated the tides of the atmosphere; but this work, like Maclaurin's, is chiefly remarkable for the importance of collateral points.

D. Bernoulli and Others.

The theory of the tidal movements of an ocean was therefore, as Laplace remarks, almost untouched when in 1774 he first undertook the subject. In the *Mécanique céleste* he gives an

[1] The account from the time of Newton to that of Laplace is founded on Laplace's *Mécanique céleste*, bk. xiii. ch. i.

interesting account of the manner in which he was led to attack the problem. We shall give below the investigation of the tides of an ocean covering the whole earth; the theory is substantially Laplace's, although presented in a different form, and embodying an important extension of Laplace's work by S. S. Hough. This theory, although very wide, is far from representing the tides of our ports. Observation shows, in fact, that the irregular distribution of land and water and the various depths of the ocean in various places produce irregularities in the oscillations of the sea of such complexity that the rigorous solution of the problem is altogether beyond the power of analysis. Laplace, however, rested his discussion of tidal observation on this principle—*The state of oscillation of a system of bodies in which the primitive conditions of movement have disappeared through friction is coperiodic with the forces acting on the system.* Hence if the sea is acted on by forces which vary periodically according to the law of simple oscillations (a simple time-harmonic), the oscillation of the sea will have exactly the same period, but the moment at which high-water will occur at any place and the amplitude of the oscillation can only be derived from observation. Now the tidal forces due to the moon and sun may be analysed into a number of constituent periodic parts of accurately determinable periods, and each of these will generate a corresponding oscillation of the sea of unknown amplitude and phase. These amplitudes and phases may be found from observation. But Laplace also used another principle, by which he was enabled to effect a synthesis of the various oscillations, so that he does not discuss a very large number of these constituent oscillations. As, however, it is impossible to give a full account of Laplace's methods without recourse to technical language, it must suffice to state here that this procedure enabled him to discuss the tides at any port by means of a combination of theory with observation. After the time of Laplace down to 1870, the most important workers in this field were Sir John Lubbock (senior), William Whewell and Sir G. B. Airy. The work of Lubbock and Whewell (see § 33 below) is chiefly remarkable for the co-ordination and analysis of enormous masses of data at various ports, and the construction of trustworthy tide-tables and the attempt to construct cotidal maps. Airy contributed an important review of the whole tidal theory. He also studied profoundly the theory of waves in canals, and explained the effects of frictional resistance on the progress of tidal and other waves.

Laplace.

Principle of Forced Oscillations.

Lubbock, Whewell and Airy.

The comparison between tidal theory and tidal observations has been carried out in two ways which we may describe as the synthetic and the analytic methods. Nature is herself synthetic, since at any one time and place we only observe one single tide-wave. All the great investigators from Newton down to Airy have also been synthetic in their treatment, for they have sought to represent the oscillation of the sea by a single mathematical expression, as will appear more fully in chapter V. below. It is true that a presupposed analysis lay behind and afforded the basis of the synthesis. But when at length tide-gauges, giving continuous records, were set up in many places the amount of data to be co-ordinated was enormously increased, and it was found that the simple formulae previously in use had to be overloaded with a multitude of corrections, so that the simplicity became altogether fictitious. This state of matters at length led Lord Kelvin (then Sir William Thomson) to suggest, about 1870, the analytic method, in which the attempt at mathematical synthesis is frankly abandoned and the complex whole is represented as the sum of a large number of separate parts, each being a perfectly simple wave or harmonic oscillation. All the best modern tidal work is carried on by the analytic method, of which we give an account below in chapter IV.

Kelvin.

Lord Kelvin's other contributions to tidal theory are also of profound importance; in particular we may mention that he established the correctness of Laplace's procedure in discussing the dynamical theory of the tides of an ocean covering the whole earth, which had been impugned by Airy and by William Ferrel. We shall have frequent occasion to refer to his name hereafter in the technical part of this article.

Amongst all the grand work which has been bestowed on the theory of this difficult subject, Newton, notwithstanding his errors, stands out first, and next to him we must rank Laplace. However original any future contribution to the science of the tides may be, it would seem as though it must perforce be based on the work of these two.

§ 8. *The Tide-Predicting Instrument.*—In the field of the practical application of theory Lord Kelvin also made another contribution of the greatest interest, when in 1872 he suggested that the laborious task of constructing a tide-table might be effected mechanically. Edward Roberts bore a very important part in the first practical realization of such a machine, and a tide-predictor now in regular use at the National Physical Laboratory for the Indian government was constructed by Légé under his direction. We refer the reader to Sir William Thomson's (Lord Kelvin's) paper on "Tidal Instruments" in *Inst. C.E.*, vol. lxv., and to the subsequent discussion, for a full account and for details of the share borne by the various persons concerned in the realization of the idea.

Tide-Predicting Instrument.

Fig. 4 illustrates diagrammatically the nature of the instrument. A cord passes over and under a succession of pulleys, every other pulley being fixed or rather balanced and the alternate ones being movable; the cord is fixed at one end and carries a pen or pencil at the other end. In the diagram there are two balanced pulleys and one movable one; a second unit would require one more movable pulley and one more balanced one. If, in our diagram, the lowest or movable pulley were made to oscillate up and down (with a simple harmonic motion), the pencil would execute the same motion on half the linear scale. If the instrument possessed two units and the second movable pulley also rocked up and down, the pencil would add to its previous motion that of this second oscillation, again on half scale. So also if there were any number of additional units, each consisting of one movable and one balanced pulley, the pencil would add together all the separate simple oscillations, and would draw a curve upon a drum, which is supposed to be kept revolving uniformly at an appropriate rate.

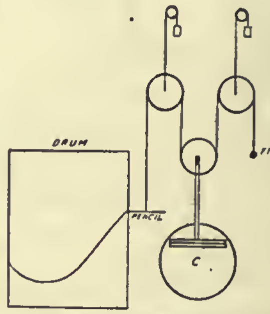

FIG. 4.—Tide-Predicting Instrument.

The rocking motion is communicated to each movable pulley by means of a pin attached to a wheel C sliding in a slot attached to the pulley frame. All the wheels C and the drum are geared together so that, as the drum turns, all the movable pulleys rock up and down. The gearing is of such a nature that if one revolution of the drum represents a single day, the rocking motion of each movable pulley corresponds to one of the simple constituent oscillations or tides into which the aggregate tide-wave is analysed. The nature of the gearing is determined by theoretical considerations derived from the motions of the sun and moon and earth, but the throw of each crank, and the angle at which it has to be set at the start are derived from observation at the particular port for which the tide-curve is required. When the tide-predictor has been set appropriately, it will run off a complete tide-curve for a whole year; the curve is subsequently measured and the heights and times of high and low-water are tabulated and published for a year or two in advance.

The Indian instrument possesses about 20 units, so that the tide-curve is regarded as being the sum of 20 different simple tides; and tide-tables are published for 40 Indian and Oriental ports. A tide-predictor has been constructed for the French government under the supervision of Lord Kelvin and is in use at Paris; another has been made by the United States Coast Survey at Washington; in 1910 one was under construction for the Brazilian government. These instruments, although differing considerably in detail from the Indian predictor, are essentially the same in principle.

§ 9. *Tidal Friction.*—All solid bodies yield more or less to stress; if they are perfectly elastic they regain their shapes after the stresses are removed, if imperfectly elastic or viscous they yield to the stresses. We may thus feel certain that the earth yields to tide-generating force, either with perfect or imperfect elasticity. Chapter VIII. will contain some discussion of this subject, and it must suffice to say here that the measurement of the minute elastic tides of the solid earth has at length been achieved. The results recently obtained by Dr O. Hecker at Potsdam constitute a conspicuous advance on all the previous attempts.

The tides of an imperfectly elastic or viscous globe are obviously subject to frictional resistance, and the like is true of the tides of an actual ocean. In either case it is clear that the system must be losing energy, and this leads to results of so much general interest that we propose to give a short sketch of the subject, deferring to chapter VIII. a more rigorous investigation. It is unfortunately impossible to give even an outline of the principles involved without the use of some technical terms.

General Explanation of Tidal Friction.

In fig. 5 the paper is supposed to be the plane of the orbit of a satellite M revolving in the direction of the arrow about the planet C, which rotates in the direction of the arrow about an axis perpendicular to the paper. The rotation of the planet is supposed to be more rapid than that of the satellite, so that the day is shorter than the month. Let us suppose that the planet is either entirely fluid, or has an ocean of such depth that it is high-water under or nearly under the satellite. When there is no friction, with the satellite at *m*, the planet is elongated into the ellipsoidal shape shown, cutting the mean sphere, which is dotted. The tidal protuberances are drawn with much exaggeration and the satellite is shown as very close to the planet in order to illustrate the principle more clearly. Now, when there is friction in the fluid motion, the tide is retarded, and high-tide occurs after the satellite has passed the meridian. Then, if we keep the same figure to represent the tidal deformation, the satellite must be at M, instead of at *m*. If we number the four quadrants as shown, the satellite must be in quadrant 1. The protuberance P is nearer to the satellite than P′, and the deficiency Q is farther away than the deficiency Q′. Hence the resultant action of the planet on the satellite must be in some such direction as MN. The action of the satellite on the planet is equal and opposite, and the force in NM, not being through the planet's centre, must produce a retarding couple on the planet's rotation, the magnitude of which depends on the length of the arm CN. This tidal frictional couple varies as the height of the tide, and as the satellite's distance. The magnitude of the tidal protuberances varies inversely as the cube of the distance of the satellite, and the difference between the attractions of the satellite on the nearer and farther protuberances also varies inversely as the cube of the distance. Accordingly the tidal frictional couple varies as the inverse sixth power of the satellite's distance. Let us now consider its effect on the satellite. If the force acting on M be resolved along and perpendicular to the direction CM, the perpendicular component tends to accelerate the satellite's velocity. It alone would carry the satellite farther from C than it would be dragged back by the central force towards C. The satellite would describe a spiral, the coils of which would be very nearly circular and very nearly coincident. If now we resolve the central component force along CM tangentially and perpendicular to the spiral, the tangential component tends to retard the velocity of the satellite, whereas the disturbing force, already considered, tends to accelerate it. With the gravitational law of force between the two bodies the retardation must prevail over the acceleration.[1] The action of tidal friction may appear somewhat paradoxical, but it is the exact converse of the acceleration of the linear and angular velocity and the diminution of distance of a satellite moving through a resisting medium. The latter result is generally more familiar than the action of tidal friction, and it may help the reader to realize the result in the present case. Tidal friction then diminishes planetary rotation, increases the satellite's distance and diminishes the orbital angular velocity. The comparative rate of diminution of the two angular velocities is generally very different. If the satellite be close to the planet the rate of increase of the satellite's periodic time or month is large compared with the rate of increase of the period of planetary rotation or day; but if the satellite is far off the converse is true. Hence, if the satellite starts very near the planet, with the month a little longer than the day, as the satellite

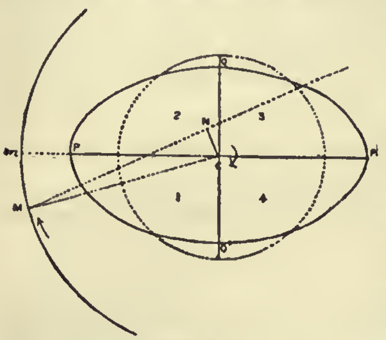

FIG. 5.

Planet's Rotation Retarded.

Satellite's Velocity Retarded.

[1] This way of presenting the action of tidal friction is due to Sir George G. Stokes.

recedes, the month soon increases so that it contains many days. The number of days in the month attains a maximum and then diminishes. Finally the two angular velocities subside to a second identity, the day and month being identical and both very long.

We have supposed that the ocean is of such depth that the tides are direct; if, however, they are inverted, with low-water under or nearly under the satellite, friction, instead of retarding, accelerates the tide; and it would be easy by drawing another figure to see that the whole of the above conclusions would hold equally true with inverted tides.

Attempts have been made to estimate the actual amount of the retardation of the earth's rotation, but without much success. It must be clear from the sketch just given that the effect of tidal friction is that the angular motion of the moon round the earth is retarded, but not to so great an extent as the earth's rotation. Thus a terrestrial observer, who regards the earth as a perfect timekeeper, would look on the real retardation of the moon's angular motion as being an acceleration. Now there is a true acceleration of the moon's angular motion which depends on a slow change in the eccentricity of the earth's orbit round the sun. After many thousands of years this acceleration will be reversed and it will become a retardation, but it will continue for a long time from now into the future; thus it is indistinguishable to us at present from a permanent acceleration. The amount of this true acceleration may be derived from the theories of the motions of the moon and of the earth when correctly developed. Laplace conceived that its observed amount was fully explained in this way, but John Couch Adams showed that Laplace had made a mistake and had only accounted for half of it. It thus appeared that there was an unexplained portion which might be only apparent and might be attributed to the effects of tidal friction.

The time and place of an eclipse of the sun depend on the motions of the moon and earth. Accordingly the records of ancient eclipses, which occurred centuries before the Christian era, afford exceedingly delicate tests of the motions of the moon and earth. At the time when Thomson and Tait's *Natural Philosophy*[2] was first published it was thought that all the numerical data were known with sufficient precision to render it possible to give a numerical estimate of the retardation of the earth's rotation. But the various revisions of the lunar theory which have been made since that date throw the whole matter into doubt. It seems probable that there is some portion of the acceleration of the moon's motion which is unexplained by gravitation, and may therefore be attributed to tidal friction, but its amount is uncertain. We can only say that the amount is very small. It is, however, not impossible that this smallness may be due to counteracting influences which tend to augment the speed of the earth's rotation; such an augmentation would result from shrinkage of the earth's mass through cooling. However this matter may stand, it does not follow that, because the changes produced by tidal friction in a man's lifetime or in many generations of man are almost insensible, the same must be true when we deal with millions of years. It follows that it is desirable to trace the effects of tidal friction back to their beginnings.

We have seen above that this cause will explain the repulsion of a satellite from a position close to the planet to a more remote distance. Now when we apply these considerations to the moon and earth we find that the moon must once have been nearly in contact with the earth. This very remarkable initial configuration of the two bodies seems to point to the origin of the moon by detachment from the earth.

Further details concerning this speculation in cosmogony are given below in chapter VIII.[3]

§ 10. *Bibliography.*—Many works on popular astronomy contain a few paragraphs on the tides, but the treatment is generally so meagre as to afford no adequate idea of the whole subject.

A complete list of works both general and technical bearing on the *theory* of the tides, from the time of Newton down to 1881, is contained in vol. ii. of the *Bibliographie de l'astronomie* by J. C. Houzeau and A. Lancaster (1882). This list does not contain papers on the tides of particular ports, and we are not aware of the existence of any catalogue of works on practical observation, reduction of observations, prediction and tidal instruments. The only general work on the tides, without mathematics, is George Darwin's *Tides and Kindred Phenomena in the Solar System.*[4] This book treats of all the subjects considered in the present article (with references to original sources), and also others such as seiches (*q.v.*) and the bore (*q.v.*).

The most extensive monograph on the tides is *A Manual of Tides* by Mr Rollin A. Harris, published by the United States Coast Survey in a series of parts, of which pt. i. appeared in 1897, and pt. iv.

[2] See that work (ed. 1883), § 830; P. H. Cowell, *M. N. R. Ast. Soc.* (1905), lxv. 861.

[3] For a discussion of the subject without mathematics, see G. H. Darwin's *Tides*.

[4] London (1898) and with important changes (1901, 1911); (Boston, 1898); translations: German, by A. Pockels (Leipzig, 1902, 1911); Italian, by G. Magrini (Turin, 1905), with appendices by translator; Magyar, by Radó von Kövesligethy (Budapest, 1904), with appendices by translator.

B in 1904. This work contains an enormous mass of useful work, and gives not only complete technical developments both on the theoretical and practical sides but also has chapters of general interest. The present writer feels it his duty, however, to dissent from Mr Harris's courageous attempt to construct the cotidal lines of the various oceans.

This work contains the most complete account of the history of tidal theories of which we know. Laplace's admirable history of the subject down to his own time has been summarized in § 7. Dr Giovanni Magrini has an appendix to his translation of Darwin's book, entitled *La Conoscenza della marea nell'antichità*, founded on the researches of Dr Roberto Almagià. Dr Almagià himself gives the results of his researches more fully in a memoir, presented to the Accademia dei Lincei of Rome (5th series, vol. v. fascic. x., 1905, 137 pp).

Another monograph on tides, treating especially the mathematical developments, is Maurice Lévy's *La Théorie des marées* (Paris, 1898). Colonel Baird's *Manual of Tidal Observation* (1886) contains instructions for the installation of tide-gauges, and auxiliary tables for harmonic analysis. Airy's article on "Tides and Waves" in the *Ency. Metrop.*, although superseded in many respects, still remains important. Harris's *Manual* contains a great collection of results of tidal observations made at ports all over the world.

The article "Die Bewegung der Hydrosphäre" in the *Encyklopädie der mathematischen Wissenschaften* (vi. 1, 1908) gives a technical account of the subject, with copious references. The same article is given in English in vol. iv. (1911) of G. H. Darwin's collected *Scientific Papers*; and vols. i. and ii. contain reprints of the several papers by the same author referred to in the present article.

Since the date of the 9th edition of the *Ency. Brit.* some technical discussion of the tides has appeared in textbooks, such as H. Lamb's *Hydrodynamics*.[1] That work also reproduces in more modern form Airy's investigation of the effects of friction on the tides of rivers. We are thus able to abridge the present article, but we shall present the extension by Hough of Laplace's theory of the tides of an ocean-covered planet, which is still only to be found in the original memoirs.

II.—Tide-Generating Forces

§ 11. *Investigations of Tide-Generating Potential and Forces.*—We have already given a general explanation of the nature of tide-generating forces; we now proceed to a rigorous investigation. If a planet is attended by a single satellite, the motion of any body relatively to the planet's surface is found by the process described as reducing the planet's centre to rest. The planet's centre will be at rest if every body in the system has impressed on it a velocity equal and opposite to that of the planet's centre; and this is accomplished by impressing on every body an acceleration equal and opposite to that of the planet's centre.

Tide-Generating Forces.

Let M, m be the masses of the planet and the satellite; r the radius vector of the satellite, measured from the planet's centre; ρ the radius vector, measured from same point, of the particle whose motion we wish to determine; and z the angle between r and ρ. The satellite moves in an elliptic orbit about the planet, and the acceleration relatively to the planet's centre of the satellite is $(M+m)/r^2$ towards the planet along the radius vector r. Now the centre of inertia of the planet and satellite remains fixed in space, and the centre of the planet describes an orbit round that centre of inertia similar to that described by the satellite round the planet but with linear dimensions reduced in the proportion of m to $M+m$. Hence the acceleration of the planet's centre is m/r^2 towards the centre of inertia of the two bodies. Thus, in order to reduce the planet's centre to rest, we apply to every particle of the system an acceleration m/r^2 parallel to r, and directed from satellite to planet.

Now take a set of rectangular axes fixed in the planet, and let $\mathrm{M}_1 r$, $\mathrm{M}_2 r$, $\mathrm{M}_3 r$ be the co-ordinates of the satellite referred thereto; and let $\xi\rho$, $\eta\rho$, $\zeta\rho$ be the co-ordinates of the particle P whose radius vector is ρ. Then the component accelerations for reducing the planet's centre to rest are $-m\mathrm{M}_1/r^2$, $-m\mathrm{M}_2/r^2$, $-m\mathrm{M}_3/r^2$; and since these are the differential coefficients with respect to $\rho\xi$, $\rho\eta$, $\rho\zeta$ of the function

$$-\frac{m\rho}{r^2}(\mathrm{M}_1\xi+\mathrm{M}_2\eta+\mathrm{M}_3\zeta),$$

and since $\cos z=\mathrm{M}_1\xi+\mathrm{M}_2\eta+\mathrm{M}_3\zeta$, it follows that the potential of the forces by which the planet's centre is to be reduced to rest is

$$-\frac{m\rho}{r^2}\cos z.$$

Now let us consider the other forces acting on the particle. The planet is spheroidal, and therefore does not attract equally in all directions; but in this investigation we may make abstraction of the ellipticity of the planet and of the ellipticity of the ocean due to the planetary rotation. This, which we set aside, is considered in the theories of gravity and of the figures of planets. Outside its body, then, the planet contributes forces of which the potential is M/ρ. Next the direct attraction of the satellite contributes forces of which the potential is the mass of the satellite divided by the distance between the point P and the satellite; this is

$$\frac{m}{\sqrt{\{r^2+\rho^2-2r\rho\cos z\}}}.$$

To determine the forces from this potential we regard ρ and z as the variables for differentiation, and we may add to this potential any constant we please. As we are seeking to find the forces which urge P relatively to M, we add such a constant as will make the whole potential at the planet's centre zero, and thus we take as the potential of the forces due to the attraction of the satellite

$$\frac{m}{\sqrt{\{r^2+\rho^2-2r\rho\cos z\}}}-\frac{m}{r}.$$

It is obvious that in the case to be considered r is very large compared with ρ, and we may therefore expand this in powers of ρ/r. This expansion gives us

$$\frac{m}{r}\left\{\frac{\rho}{r}P_1+\frac{\rho^2}{r^2}P_2+\frac{\rho^3}{r^3}P_3+\dots\right\},$$

where $P_1=\cos z$, $P_2=\frac{3}{2}\cos^2 z-\frac{1}{2}$, $P_3=\frac{5}{2}\cos^3 z-\frac{3}{2}\cos z$, &c. The reader familiar with spherical harmonic analysis of course recognizes the zonal harmonic functions; but the result for a few terms, which is all that is necessary, is easily obtainable by simple algebra.

Now, collecting together the various contributions to the potential, and noticing that $\frac{m}{r}\cdot\frac{\rho}{r}P_1=\frac{m\rho}{r^2}\cos z$, and is therefore equal and opposite to the potential by which the planet's centre was reduced to rest, we have as the potential of the forces acting on a particle whose co-ordinates are $\rho\xi$, $\rho\eta$, $\rho\zeta$

$$\frac{M}{\rho}+\frac{m\rho^2}{r^3}\left(\tfrac{3}{2}\cos^2 z-\tfrac{1}{2}\right)+\frac{m\rho^3}{r^4}\left(\tfrac{5}{2}\cos^3 z-\tfrac{3}{2}\cos z\right)+\dots \quad (1)$$

The first term of (1) is the potential of gravity, and the terms of the series, of which two only are written, constitute the tide-generating potential. In all practical applications this series converges so rapidly that the first term is amply sufficient, and thus we shall generally denote

Potential.

$$V=\frac{3m}{2r^3}\rho^2\left(\cos^2 z-\tfrac{1}{3}\right) \quad (2)$$

as the tide-generating potential.[2]

At the surface of the earth ρ is equal to a the earth's radius.

§ 12. *Form of Equilibrium.*—Consider the shape assumed by an ocean of density σ, on a planet of mass M, density δ and radius a, when acted on by disturbing forces whose potential is a solid spherical harmonic of degree i, the planet not being in rotation.

If S_i denotes a surface spherical harmonic of order i, such a potential is given at the point whose radius vector is ρ by

$$V=\frac{3ma^2}{2r^3}\left(\frac{\rho}{a}\right)^i S_i. \quad (3)$$

In the case considered in § 11, $i=2$ and S_i becomes the second zonal harmonic $\cos^2 z-\frac{1}{3}$.

The theory of harmonic analysis tells us that the form of the ocean, when in equilibrium, must be given by the equation

$$\rho=a+e_iS_i. \quad (4)$$

Our problem is to evaluate e_i. We know that the external potential of a layer of matter, of depth e_iS_i and density σ, has the value

$$\frac{4\pi\sigma a}{2i+1}\left(\frac{a}{\rho}\right)^{i+1}e_iS_i.$$

Hence the whole potential externally to the planet and up to its surface is

$$\frac{M}{\rho}+\frac{3ma^2}{2r^3}\left(\frac{\rho}{a}\right)^i S_i+\frac{4\pi\sigma a}{2i+1}\left(\frac{a}{\rho}\right)^{i+1}e_iS_i. \quad (5)$$

The first and most important term is the potential of the planet, the second that of the disturbing force, and the third that of the departure from sphericity.

Since the ocean must stand in a level surface, the expression (5) equated to a constant must be another form of (4). Hence, if we put $\rho=a+e_iS_i$ in the first term of (5) and $\rho=a$ in the second and third terms, (5) must be constant; this can only be the case if the

[1] The theory as presented in the *Mécanique céleste* is unnecessarily difficult, and was much criticized by Airy. Before the publication of the 9th and 10th editions of the *Ency. Brit.* it was necessary for the student to read a number of controversial papers published all over the world in order to get at the matter.

[2] The reader may refer to Thomson and Tait's *Natural Philosophy* (1883), pt. ii. §§ 798–821, for further considerations on this and analogous subjects, together with some interesting examples.

coefficient of S_i vanishes. Hence on effecting these substitutions and equating that coefficient to zero, we find

$$-\frac{M}{a^2}e_i+\frac{3ma^2}{2r^3}+\frac{4\pi\sigma a}{2i+1}e_i=0.$$

But by the definitions of δ and a we have $M=\frac{4}{3}\pi\delta a^3=ga^2$, where g is gravity, and therefore

$$e_i=\frac{\dfrac{3ma^2}{2gr^3}}{1-\dfrac{3\sigma}{(2i+1)\delta}}. \tag{6}$$

In the particular case considered in § 11 we therefore have

$$\rho=a\left[1+\frac{3ma^2/2gr^3}{1-3\sigma/5\delta}(\cos^2 z-\tfrac{1}{3})\right] \tag{7}$$

as the equation to the equilibrium tide under the potential

$$V=\frac{3m}{2r^3}\rho^2(\cos^2 z-\tfrac{1}{3}).$$

If σ were very small compared with δ the attraction of the water on itself would be very small compared with that of the planet on the water; hence we see in the general case that $1/\left(1-\frac{3\sigma}{(2i+1)\delta}\right)$ is the factor by which the mutual gravitation of the ocean augments the deformation due to the external forces. This factor will occur frequently hereafter, and therefore for brevity we write

$$b_i=1-\frac{3\sigma}{(2i+1)\delta}, \tag{8}$$

and we may put (6) in the form

$$e_i=\frac{3ma^2}{2gr^3b_i}. \tag{9}$$

Comparison with (5) then shows that

$$V=gb_i\left(\frac{\rho}{a}\right)^i e_iS_i \tag{10}$$

is the potential of the disturbing forces under which

$$\rho=a+e_iS_i \tag{11}$$

is a figure of equilibrium.

We are thus provided with a convenient method of specifying any disturbing force by means of the figure of equilibrium which it is competent to maintain. In considering the dynamical theory of the tides on an ocean-covered planet, we shall specify the disturbing forces in the manner expressed by (10) and (11). This way of specifying a disturbing force is equally exact whether or not we choose to include the effects of the mutual attraction of the ocean. If the augmentation due to mutual attraction of the water is not included, b_i becomes equal to unity; there is no longer any necessity to use spherical harmonic analysis, and we see that if the equation to the surface of an ocean be

$$\rho=a+S,$$

where S is a function of latitude and longitude, it is in equilibrium under forces due to a potential whose value at the surface of the sphere (where $\rho=a$) is gS.

In treating the theory of tidal observation we shall specify the tide-generating forces in this way, and then by means of "the principle of forced vibrations," referred to in § 7 as used by Laplace for discussing the actual oscillations of the sea, we shall pass to the actual tides at the port of observation.

Effect of Land in Equilibrium Theory.

In this equilibrium theory it is assumed that the figure of the ocean is at each instant one of equilibrium under the action of gravity and of the tide-generating forces. Lord Kelvin has, however, reasserted[1] a point which was known to Bernoulli, but has since been overlooked, namely, that this law of rise and fall of water cannot, when portions of the globe are continents, be satisfied by a constant volume of water in the ocean. The necessary correction to the theory depends on the distribution of land and sea, but a numerical solution shows that it is practically of very small amount.

§ 13. *Development of Tide-generating Potential in Terms of Hour-Angle and Declination.*—We now proceed to develop the tide-generating potential, and shall of course implicitly (§ 12) determine the equation to the equilibrium figure.

We have already seen that, if z be the moon's zenith distance at the point P on the earth's surface, whose co-ordinates referred to A, B, C, axes fixed in the earth, and $a\xi$, $a\eta$, $a\zeta$,

$$\cos z=\xi M_1+\eta M_2+\zeta M_3,$$

where M_1, M_2, M_3 are the moon's direction cosines referred to the same axes. Then, with this value of $\cos z$,

$$\cos^2 z-\tfrac{1}{3}=2\xi\eta M_1M_2+2\frac{\xi^2-\eta^2}{2}\frac{M_1^2-M_2^2}{2}+2\eta\zeta M_2M_3+2\xi\zeta M_1M_3$$
$$+\tfrac{3}{2}\cdot\frac{\xi^2+\eta^2-2\zeta^2}{3}\,\frac{M_1^2+M_2^2-2M_3^2}{3}. \tag{12}$$

[1] Thomson and Tait, *Nat. Phil.* § 807. G. H. Darwin and H. H. Turner, *Proc. Roy. Soc.* (1886).

The axis of C is taken as the polar axis, and AB is the equatorial plane, so that the functions of ξ, η, ζ are functions of the latitude and longitude of the point P, at which we wish to find the potential.

The functions of M_1, M_2, M_3 depend on the moon's position, and we shall have occasion to develop them in two different ways—first in terms of her hour-angle and declination, and secondly (§ 25) in terms of her longitude and the elements of the orbit.

Now let A be on the equator in the meridian of P, and B 90° east of A on the equator. Then, if M be the moon, the inclination of the plane MC to the plane CA is the moon's easterly local hour-angle. Let h_0 = Greenwich westward hour-angle; l = the west longitude of the place of observation; λ = the latitude of the place; δ = moon's declination: then we have

$$M_1=\cos\delta\cos(h_0-l),\ M_2=-\cos\delta\sin(h_0-l),\ M_3=\sin\delta,$$
$$\xi=\cos\lambda,\ \eta=0,\ \zeta=\sin\lambda.$$

Also the radius vector of the place of observation on the earth's surface is a. Whence we find

$$V=\frac{3ma^2}{2r^3}\left\{\tfrac{1}{3}\cos^2\lambda\cos^2\delta\cos 2(h_0-l)+\sin 2\lambda\sin\delta\cos\delta\cos(h_0-l)\right.$$
$$\left.+\tfrac{3}{2}(\tfrac{1}{3}-\sin^2\delta)(\tfrac{1}{3}-\sin^2\lambda)\right\} \tag{13}$$

The tide-generating forces are found by the rates of variation of V for latitude and longitude, and also for radius a, if we care to find the radial disturbing force.

Potential Developed in Hour-angle and Declination.

The westward component of the tide-generating force at the earth's surface, where $\rho=a$, is $dV/a\cos\lambda dl$, and the northward component is $dV/ad\lambda$; the change of apparent level is the ratio of these to gravity g. On effecting the differentiations we find that the westward component is made up of two periodic terms, one going through its variations twice and the other once a day. The southward component has also two similar terms; but it has a third very small term, which does not oscillate about a zero value. This last term corresponds to forces which produce a constant heaping up of the water at the equator; or, in other words, the moon's attraction has the effect of causing a small permanent ellipticity of the earth's mean figure. This augmentation of ellipticity is of course very small, but it is necessary to mention it.

If we consider the motion of a pendulum-bob under the influence of these forces during any one day, we see that in consequence of the semi-diurnal changes of level it twice describes an ellipse with major axis east and west, and the formula when developed shows that the ratio of axes is equal to the sine of the latitude, and the linear dimensions proportional to $\cos^2\delta$. It describes once a day an ellipse whose north and south axis is proportional to $\sin 2\delta\cos 2\lambda$ and whose east and west axis is proportional to $\sin 2\delta\sin\lambda$. Obviously the latter is circular in latitude 30°. When the moon is on the equator, the maximum deflexion occurs when the moon's local hour-angle is 45°, and is then equal to

$$\frac{3m}{2M}\left(\frac{a}{r}\right)^3\cos\lambda.$$

This angle is equal to 0·0174″ $\cos\lambda$. Attempts actually to measure the deflexion of the vertical have at length proved successful (see SEISMOMETER).

III.—DYNAMICAL THEORY OF THE TIDES

§ 14. *Recent Advances in the Dynamical Theory of the Tides.*—The problem of the tidal oscillation of the sea is essentially dynamical. In two papers in the second volume of *Liouville's Journal* (1896) H. Poincaré has considered the mathematical principles involved in the problem, where the ocean is interrupted by land as in actuality. He has not sought to obtain numerical results applicable to any given configuration of land and sea, but he has aimed rather at pointing out methods by which it may some day be possible to obtain such solutions.

Even when the ocean is taken as covering the whole earth the problem presents formidable difficulties, and this is the only case in which it has been solved hitherto.[2]

Laplace gives the solution in bks. i. and iv. of the *Mécanique céleste;* but his work is unnecessarily complicated. In the 9th edition of the *Ency. Brit.* we gave Laplace's theory without these complications, but the theory is now accessible in H. Lamb's *Hydrodynamics* and other works of the kind. It is therefore not reproduced here.

In 1897 and 1898 S. S. Hough undertook an important revision of Laplace's theory and succeeded not only in introducing the effects of the mutual gravitation of the ocean, but

[2] Lord Kelvin's (Sir W. Thomson's) paper on the gravitational oscillations of rotating water, *Phil. Mag.* (October 1880), bears on this subject. It is the only attempt to obtain numerical results in respect to the effect of the earth's rotation on the oscillations of land-locked seas.

also in determining the nature and periods of the free oscillations of the sea.[1] A dynamical problem of this character cannot be regarded as fully solved unless we are able not only to discuss the "forced" oscillations of the system but also the "free." Hence we regard Mr Hough's work as the most important contribution to the dynamical theory of the tides since the time of Laplace. We shall accordingly present the theory briefly in the form due to Mr Hough.

The analysis is more complex than that of Laplace, where the mutual attraction of the ocean was neglected, but this was perhaps inevitable. Our first task is to form the equations of motion and continuity, which will be equally applicable to all forms of the theory.

§ 15. *Equations of Motion.*—Let r, θ, ϕ be the radius vector, colatitude and east longitude of a point with reference to an origin, a polar axis and a zero-meridian rotating with a uniform angular velocity n from west to east. Then if R, H, Ξ be the radial, colatitudinal and longitudinal accelerations of the point, we have

$$\mathrm{R}=\frac{d^2r}{dt^2}-r\left(\frac{d\theta}{dt}\right)^2-r\sin^2\theta\left(\frac{d\phi}{dt}+n\right)^2$$

$$\Xi=\frac{1}{r}\frac{d}{dt}\left(r^2\frac{d\theta}{dt}\right)-r\sin\theta\cos\theta\left(\frac{d\phi}{dt}+n\right)^2$$

$$\mathrm{H}=\frac{1}{r\sin\theta}\frac{d}{dt}\left[r^2\sin^2\theta\left(\frac{d\phi}{dt}+n\right)\right].$$

If the point were at rest with reference to the rotating meridian we should have

$$\mathrm{R}=-n^2r\sin\theta,\ \Xi=-n^2r\sin\theta\cos\theta,\ \mathrm{H}=0.$$

When these considerations are applied to the motion of an ocean relative to a rotating planet, it is clear that these accelerations, which still remain when the ocean is at rest, are annulled by the permanent oblateness of the ocean. As then they take no part in the oscillations of the ocean, and as we are not considering the figure of the planet, we may omit these terms from R and Ξ. This being so we must replace $\left(\frac{d\phi}{dt}+n\right)^2$ as it occurs in R and Ξ by $\left(\frac{d\phi}{dt}\right)^2+2n\frac{d\phi}{dt}$.

Now suppose that the point whose accelerations are under consideration never moves far from its zero position, and that its displacements ξ, $\eta\sin\theta$ in colatitude and longitude are very large compared with ρ its radial displacement. Suppose, further, that the velocities of the point are so small that their squares and products are negligible compared with n^2r^2; then we have

$$\frac{dr}{dt}=\frac{d\rho}{dt},\ \text{a very small quantity;}$$

$$r\sin\theta\frac{d\phi}{dt}=\frac{d}{dt}\left(\eta\sin\theta\right),$$

$$r\frac{d\theta}{dt}=\frac{d\xi}{dt}.$$

Since the radial velocity always remains very small it is not necessary to concern ourselves further with the value of R, and we only require the two other components which have the approximate forms,

$$\left.\begin{aligned}\Xi&=\frac{d^2\xi}{dt^2}-2n\sin\theta\cos\theta\frac{d\eta}{dt},\\ \mathrm{H}&=\sin\theta\frac{d^2\eta}{dt^2}+2n\cos\theta\frac{d\xi}{dt}\end{aligned}\right\}. \qquad (14)$$

We have now to consider the forces by which an element of the ocean is urged in the direction of colatitude and longitude. These forces are those due to the external disturbing forces, to the pressure of the water, surrounding an element of the ocean, and to the attraction of the ocean itself.

If $\mathfrak{e}$ denotes the equilibrium height of the tide, it is a function of colatitude and longitude, and may be expanded in a series of spherical surface harmonics $\mathfrak{e}_i$. Thus we may write the equation to the equilibrium tide in the form.

$$r=a+\mathfrak{e}=a+\Sigma\mathfrak{e}_i.$$

Now it appears from (10) and (11) that the value of the potential, at the surface of the sphere where $\rho=a$, under which this is a figure of equilibrium, is

$$\mathrm{V}=\Sigma gb_i\mathfrak{e}_i.$$

We may use this as specifying the external disturbing force due to the known attractions of the moon and sun, so that $\mathfrak{e}_i$ may be regarded as known.

But in our dynamical problem the ocean is not a figure of equilibrium, and we may denote the elevation of the surface at any moment of time by $\mathfrak{h}$. Then the equation to the surface may be written in the form

$$r=a+\mathfrak{h}=a+\Sigma\mathfrak{h}_i,$$

where $\mathfrak{h}_i$ denotes a spherical harmonic just as $\mathfrak{e}_i$ did before.

[1] *Phil. Trans.*, 189 A, pp. 201–258 and 191 A, pp. 139–185.

The surface value of the potential of the forces which would maintain the ocean in equilibrium in the shape it has at any moment is $\Sigma gb_i\mathfrak{h}_i$. Hence it follows that in the actual case the forces due to fluid pressure and to the attraction of the ocean must be such as to balance the potential just determined. Therefore these forces are those due to a potential—$\Sigma gb_i\mathfrak{h}_i$. If we add to this the potential of the external forces, we have a potential which will include all the forces, the expression for which is $-g\Sigma b_i(\mathfrak{h}_i-\mathfrak{e}_i)$. If further we perform the operations $d/ad\theta$ and $d/a\sin\theta d\phi$ on this potential, we obtain the colatitudinal and longitudinal forces which are equal to the accelerations Ξ and H.

It follows, then, from (14) that the equations of motion are

$$\left.\begin{aligned}\frac{d^2\xi}{dt^2}-2n\sin\theta\cos\theta\frac{d\eta}{dt}&=-\frac{g}{a}\Sigma b_i\frac{d}{d\theta}\left(\mathfrak{h}_i-\mathfrak{e}_i\right)\\ \sin\theta\frac{d^2\eta}{dt^2}+2n\cos\theta\frac{d\xi}{dt}&=-\frac{g}{a\sin\theta}\Sigma b_i\frac{d}{d\phi}\left(\mathfrak{h}_i-\mathfrak{e}\right)\end{aligned}\right\} \qquad (15)$$

Equations of Motion.

It remains to find the equation of continuity. This may be deduced geometrically from the consideration that the volume of an element of the fluid remains constant; but a shorter way is to derive it from the equation of continuity as it occurs in ordinary hydrodynamical investigations. If Φ be a velocity potential, the equation of continuity for incompressible fluid is

$$\delta r\frac{d}{dr}\left(r^2\frac{d\Phi}{dr}\sin\theta\,\delta\theta\,\delta\phi\right)+\delta\theta\frac{d}{d\theta}\left(r\sin\theta\frac{d\Phi}{rd\theta}\delta r\delta\phi\right)$$
$$+\delta\phi\frac{d}{d\phi}\left(r\frac{1}{r\sin\theta}\frac{d\Phi}{d\phi}\delta r\,\delta\theta\right)=0.$$

The element referred to in this equation is defined by r, θ, ϕ, $r+\delta r$, $\theta+\delta\theta$, $\phi+\delta\phi$. The colatitudinal and longitudinal velocities are the same for all the elementary prism defined by θ, ϕ, $\theta+\delta\theta$, $\phi+\delta\phi$, and the sea bottom. Then $\frac{d\Phi}{rd\theta}=\frac{d\xi}{dt}$, $\frac{d\Phi}{r\sin\theta d\phi}=\sin\theta\frac{d\eta}{dt}$; and, since the radial velocity is $d\mathfrak{h}/dt$ at the surface of the ocean, where $r=a+\gamma$, and is zero at the sea bottom, where $r=a$, we have $\frac{d\Phi}{dr}=\frac{r-a}{\gamma}\frac{d\mathfrak{h}}{dt}$. Hence, integrating with respect to r from $r=a+\gamma$ to $r=a$, and again with respect to t from time t to the time when $\mathfrak{h}$, ξ, η all vanish, and treating γ and $\mathfrak{h}$ as small compared with a, we have

$$\mathfrak{h}a\sin\theta+\frac{d}{d\theta}(\gamma\xi\sin\theta)+\frac{d}{d\phi}(\gamma\eta\sin\theta)=0. \qquad (16)$$

This is the equation of continuity, and, together with (15), it forms the system which must be integrated in the general problem of the tides. The difficulties in the way of a solution are so great that none has hitherto been found, except on the supposition that γ, the depth of the ocean, is only a function of latitude. In this case (16) becomes

Equation of Continuity.

$$\mathfrak{h}a+\frac{1}{\sin\theta}\frac{d}{d\theta}(\gamma\xi\sin\theta)+\gamma\frac{d\eta}{d\phi}=0. \qquad (17)$$

§ 16. *Adaptation to Forced Oscillations.*—Since we may suppose that the free oscillations are annulled by friction, the solution required is that corresponding to forced oscillations. Now we have seen from (13) that $\mathfrak{e}$ (which is proportional to V) has terms of three kinds, the first depending on twice the moon's (or sun's) hour-angle, the second on the hour-angle, and the third independent thereof. The coefficients of the first and second vary slowly, and the whole of the third varies slowly. Hence $\mathfrak{e}$ has a semi-diurnal, a diurnal and a long-period term. We shall see later that these terms may be expanded in a series of approximately semi-diurnal, diurnal and slowly varying terms, each of which is a strictly harmonic function of the time.

Thus according to the usual method of treating oscillating systems, we may make the following assumptions as to the form of the solution

$$\left.\begin{aligned}\mathfrak{e}&=\Sigma\mathfrak{e}_i=\Sigma e_i\cos(2nft+s\phi+\alpha)\\ \mathfrak{h}&=\Sigma\mathfrak{h}_i=\Sigma h_i\cos(2nft+s\phi+\alpha)\\ \xi&=\Sigma b_ix_i\cos(2nft+s\phi+\alpha)\\ \eta&=\Sigma b_iy_i\sin(2nft+s\phi+\alpha)\end{aligned}\right\} \qquad (18)$$

where e_i, h_i, x_i, y_i are functions of colatitude only, and e_i, h_i are the associated functions of colatitude corresponding to the harmonic of order i and rank s.

For the semi-diurnal tides $s=2$ and f is approximately unity; for the diurnal tides $s=1$ and f is approximately $\frac{1}{2}$; and for the tides of long period $s=0$ and f is a small fraction.

Substituting these values in (17) we have

$$\Sigma\left[\frac{1}{\sin\theta}\frac{d}{d\theta}(\gamma b_ix_i\sin\theta)+s\gamma b_iy_i+h_ia\right]=0. \qquad (19)$$

Then if we write u_i for h_i-e_i, and put $m=n^2a/g$, substitution from (18) in (15) leads at once to

$$\left.\begin{aligned}f^2\Sigma b_ix_i-f\sin\theta\cos\theta\Sigma b_iy_i&=\frac{1}{4m}\frac{d}{d\theta}\Sigma b_iu_i,\\ f^2\sin\theta\Sigma b_iy_i+f\cos\theta\Sigma b_ix_i&=-\frac{s}{4m\sin\theta}\Sigma b_iu_i.\end{aligned}\right\}. \qquad (20)$$

Solving (20), we have

$$\left.\begin{aligned}(\Sigma b_i x_i)(f^2-\cos^2\theta) &= \frac{1}{4m}\left[\frac{d}{d\theta}\Sigma b_i u_i + \frac{s\cos\theta}{f\sin\theta}\Sigma b_i u_i\right]\\ (\Sigma b_i y_i)\sin^2\theta(f^2-\cos^2\theta) &= -\frac{1}{4m}\left[\frac{\cos\theta}{f}\frac{d}{d\theta}\Sigma b_i u_i + \frac{s}{\sin\theta}\Sigma b_i u_i\right]\end{aligned}\right\} \qquad (21)$$

Then substituting from (21) in (19) we have

$$\frac{1}{\sin\theta}\frac{d}{d\theta}\left[\frac{\gamma(\sin\theta\frac{d}{d\theta}\Sigma b_i u_i+\frac{s}{f}\cos\theta\Sigma b_i u_i)}{f^2-\cos^2\theta}\right] - \frac{s\gamma\left[\frac{\cos\theta}{f}\frac{d}{d\theta}\Sigma b_i u_i+\frac{s}{\sin\theta}\Sigma b_i u_i\right]}{\sin\theta\,(f^2-\cos^2\theta)} + 4ma\Sigma(u_i+e_i)=0. \qquad (22)$$

This is almost the same as Laplace's equation for tidal oscillations in an ocean whose depth is only a function of latitude. If indeed we treat b_i as unity (thereby neglecting the mutual attraction of the water) and replace Σu_i and Σe_i by u and e, we obtain Laplace's equation.

When u_i is found from this equation, its value substituted in (21) will give x_i and y_i.

§ 17. *Zonal Oscillations.*—We might treat the general harmonic oscillations first, and proceed to the zonal oscillations by putting $s=0$. These waves are, however, comparatively simple, and it is well to begin with them. The zonal tides are those which Laplace describes as of the first species, and are now more usually called the tides of long period. As we shall only consider the case of an ocean of uniform depth, γ the depth of the sea is constant. Then since in this case $s=0$, our equation (22), to be satisfied by u_i or h_i-e_i, becomes

$$\frac{d}{d\theta}\left[\frac{\sin\theta\frac{d}{d\theta}\Sigma b_i u_i}{f^2-\cos^2\theta}\right]+\frac{4ma}{\gamma}\sin\theta\Sigma h_i=0.$$

This may be written

$$\frac{d}{d\theta}\Sigma b_i u_i+\frac{4ma}{\gamma}\frac{f^2-\cos^2\theta}{\sin\theta}\int^\theta \Sigma h_i\sin\theta d\theta+A=0, \qquad (23)$$

where A is a constant.

Let us assume

$$h_i=C_iP_i,\quad e_i=E_iP_i$$

where P_i denotes the ith zonal harmonic of $\cos\theta$. The coefficients C_i are unknown, but the E_i are known because the system oscillates under the action of known forces.

If the term involving the integral in this equation were expressed in terms of differentials of harmonics, we should be able to equate to zero the coefficient of each $dP_i/d\theta$ in the equation, and thus find the conditions for determining the C's.

The task then is to express $\frac{f^2-\cos^2\theta}{\sin\theta}\int^\theta P_i\sin\theta d\theta$ in differentials of zonal harmonics.

It is well known that P_i satisfies the differential equation

$$\frac{d}{d\theta}\left(\sin\theta\frac{dP_i}{d\theta}\right)+i(i+1)P_i\sin\theta=0. \qquad (24)$$

Therefore $\int P_i\sin\theta d\theta=-\frac{1}{i(i+1)}\sin\theta\frac{dP_i}{d\theta}$, and

$$\begin{aligned}\frac{f^2-\cos^2\theta}{\sin\theta}\int P_i\sin\theta d\theta &= -\frac{1}{i(i+1)}(f^2-\cos^2\theta)\frac{dP_i}{d\theta}\\ &= -\frac{1}{i(i+1)}(f^2-1)\frac{dP_i}{d\theta}-\frac{1}{i(i+1)}\sin^2\theta\frac{dP_i}{d\theta}.\end{aligned}$$

Another well-known property of zonal harmonics is that

$$\sin\theta\frac{dP_i}{d\theta}=\frac{i(i+1)}{2i+1}(P_{i+1}-P_{i-1}). \qquad (25)$$

If we differentiate (25) and use (24) we have

$$\frac{i(i+1)}{2i+1}\left(\frac{dP_{i+1}}{d\theta}-\frac{dP_{i-1}}{d\theta}\right)+i(i+1)P_i\sin\theta=0. \qquad (26)$$

Multiplying (25) by $\sin\theta$, and using (26) twice over,

$$\sin^2\theta\frac{dP_i}{d\theta}=\frac{i(i+1)}{2i+1}\left\{-\frac{1}{2i+3}\left(\frac{dP_{i+2}}{d\theta}-\frac{dP_i}{d\theta}\right)+\frac{1}{2i-1}\left(\frac{dP_i}{d\theta}-\frac{dP_{i-2}}{d\theta}\right)\right\}.$$

Therefore

$$\begin{aligned}\frac{f^2-\cos^2\theta}{\sin\theta}\int P_i\sin\theta d\theta &= \frac{1}{(2i-1)(2i+1)}\frac{dP_{i-2}}{d\theta}\\ &\quad-\left\{\frac{f^2-1}{i(i+1)}+\frac{2}{(2i-1)(2i+3)}\right\}\frac{dP_i}{d\theta}+\frac{1}{(2i+1)(2i+3)}\frac{dP_{i+2}}{d\theta}.\end{aligned}$$

This expression, when multiplied by $4ma/\gamma$ and by C_i and summed, is the second term of our equation.

The first term is

$$\Sigma b_i(C_i-E_i)\frac{dP_i}{d\theta}.$$

In order that the equation may be satisfied, the coefficient of each $dP_i/d\theta$ must vanish identically. Accordingly we multiply the whole by $\gamma/4ma$ and equate to zero the coefficient in question, and obtain

$$\frac{b_i\gamma}{4ma}(C_i-E_i)+\frac{C_{i-2}}{(2i-1)(2i-3)}-\left\{\frac{f^2-1}{i(i+1)}+\frac{2}{(2i-1)(2i+3)}\right\}C_i+\frac{C_{i+2}}{(2i+3)(2i+5)}=0. \qquad (27)$$

This equation (27) is applicable for all values of i from 1 to infinity, provided that we take C_0, E_0, C_{-1}, E_{-1} as being zero.

We shall only consider in detail the case of greatest interest, namely that of the most important of the tides generated by the attraction of the sun and moon. We know that in this case the equilibrium tide is expressed by a zonal harmonic of the second order; and therefore all the E_i, excepting E_2, are zero. Thus the equation (27) will not involve E_i in any case excepting when $i=2$.

If we write for brevity

$$L_i=\frac{f^2-1}{i(i+1)}+\frac{2}{(2i-1)(2i+3)}-\frac{b_i\gamma}{4ma},$$

the equation (27) is

$$\frac{C_{i+2}}{(2i+3)(2i+5)}-L_iC_i+\frac{C_{i-2}}{(2i-3)(2i-1)}=0. \qquad (28)$$

Save that when $i=2$, the right-hand side is $b_2\gamma E_2/4ma$, a known quantity *ex hypothesi*.

The equations naturally separate themselves into two groups in one of which all the suffixes are even and the other odd. Since our task is to evaluate all the C's in terms of E_2, it is obvious that all the C's with odd suffixes must be zero, and we are left to consider only the cases where $i=2$, 4, 6, &c.

We have said that C_0 must be regarded as being zero; if however we take

$$C_0=-3b_2\gamma E_2/4ma,$$

so that C_0 is essentially a known quantity, the equation (28) has complete applicability for all even values of i from 2 upwards.

The equations are

$$\begin{aligned}&\frac{C_0}{1\cdot3}-L_2C_2+\frac{C_4}{7\cdot9}=0\\ &\frac{C_2}{5\cdot7}-L_4C_4+\frac{C_6}{11\cdot13}=0.\\ &\quad\text{\&c.}\quad\text{\&c.}\end{aligned}$$

It would seem at first sight as if these equations would suffice to determine all the C's in terms of C_2, and that C_2 would remain indeterminate; but we shall show that this is not the case.

For very large values of i the general equation of condition (28) tends to assume the form

$$\frac{C_{i+2}+C_{i-2}}{C_i}+\frac{i^2\gamma}{ma}=0.$$

By writing successively $i+2$, $i+4$, $i+6$ for i in this equation, and taking the differences, we obtain an equation from which we see that, *unless C_i/C_{i+2} tends to become infinitely small*, the equations are satisfied by $C_i=C_{i+2}$ in the limit for very large values of i.

Hence, if C_i does not tend to zero, the later portion of the series for h tends to assume the form $C_i(P_i+P_{i+2}+P_{i+4}\ldots)$. All the P's are equal to unity at the pole; hence the hypothesis that C_i does not tend to zero leads to the conclusion that the tide is of infinite height at the pole. The expansion of the height of tide is essentially convergent, and therefore the hypothesis is negatived. Thus we are entitled to assume that C_i tends to zero for large values of i.

Now writing for brevity

$$a_i=1/(2i+1)(2i+3)^2(2i+5),$$

we may put (28) into the form

$$\frac{C_{i-2}/C_i}{(2i-3)(2i-1)}=L_i-\frac{a_i}{\dfrac{C_i/C_{i+2}}{(2i+1)(2i+3)}}.$$

By successive applications of this formula we may write the right-hand side in the form of a continued fraction.

Let

$$K_i=\frac{a_{i-2}}{L_i-}\,\frac{a_i}{L_{i+2}-}\,\frac{a_{i+2}}{L_{i+4}-}\cdots$$

Then we have

$$\frac{C_{i-2}/C_i}{(2i-3)(2i-1)}=\frac{a_{i-2}}{K_i},$$

or

$$C_i/C_{i-2}=(2i-1)(2i+1)K_i.$$

Thus

$$C_2=3.5K_2C_0;\ C_4=3.5.7.9K_2K_4C_0;\quad C_6=3.5.7.9.11.13K_2K_4K_6C_0,\ \text{\&c.}$$

If we assume that any of the higher C's, such as C_{14} or C_{16}, is of negligible smallness, all the continued fractions K_2, K_4, K_6, &c., may be computed; and thus we find all the C's in terms of C_0, which is equal to $-3b_2\gamma E_2/4ma$. The height of the tide is therefore given by

$$\begin{aligned}\mathfrak{h}&=\Sigma h_i\cos(2nft+a)\\ &=-\frac{3b_2\gamma}{4ma}E_2\{3.5K_2P_2+3.5.7.9K_2K_4P_4+\ldots\}\cos(2nft+a).\end{aligned}$$

It is however more instructive to express $\mathfrak{h}$ as a multiple of the equilibrium tide ϵ, which is as we know equal to $E_2P_2 \cos(2nft+\alpha)$. Whence we find

$$\mathfrak{b} = -\frac{3b_2\gamma}{4ma}\frac{\epsilon}{P_2}\{3\cdot5K_2P_2+3\cdot5\cdot7\cdot9K_2K_4P_4+3\cdot5\ldots13K_2K_4K_6P_6\ldots\}.$$

The number f is a fraction such that its reciprocal is twice the number of sidereal days in the period of the tide. The greatest value of f is that appertaining to the lunar fortnightly tide (Mf in notation of harmonic analysis), and in this case f is in round numbers $1/28$, or more exactly $f^2 = \cdot00133$. The ratio of the density σ of sea-water to δ the mean density of the earth is $\cdot18093$; which value gives us

$$b_2 = 1-\frac{3\sigma}{5\delta} = \cdot89144.$$

The quantity m is the ratio of equatorial centrifugal force to gravity, and is equal to $1/289$. Finally, γ/a is the depth of the ocean expressed as a fraction of the earth's radius.

With these numerical values Mr Hough has applied the solution to determine the lunar fortnightly tide for oceans of various depths. Of his results we give two:—

First, when $\gamma = 7260$ ft. $= 1210$ fathoms, which makes $\gamma/4ma = 1/40$, he finds

$$\mathfrak{b} = \frac{\epsilon}{P_2}\{\cdot2669P_2 - \cdot1678P_4 + \cdot0485P_6 - \cdot0081P_8 + \cdot0009P_{10} - \cdot0001P_{12}\ldots\}.$$

If the equilibrium theory were true we should have

$$\mathfrak{b} = \frac{\epsilon}{P_2}\{P_2\};$$

thus we see how widely the dynamical solution differs from the equilibrium value.

Secondly, when $\gamma = 58080$ ft. $= 9680$ fathoms, and $\gamma/4ma = 1/5$, he finds

$$\mathfrak{b} = \frac{\epsilon}{P_2}\{\cdot7208P_2 - \cdot0973P_4 + \cdot0048P_6 - \cdot0001P_6\ldots\}.$$

From this we see that the equilibrium solution presents some sort of approximation to the dynamical one; and it is clear that the equilibrium solution would be fairly accurate for oceans which are still quite shallow when expressed as fractions of the earth's radius, although far deeper than the actual sea.

The tides of long period were not investigated by Laplace in this manner, for he was of opinion that a very small amount of friction would suffice to make the ocean assume its form of equilibrium. In the arguments which he adduced in support of this view the friction contemplated was such that the integral effect was proportional to the velocity of the water relatively to the bottom. It is probable that proportionality to the square of the velocity would have been nearer the truth, but the distinction is unimportant.

The most rapid of the oscillations of this class is the lunar fortnightly tide, and the water of the ocean moves northward for a week and then southward for a week. In oscillating systems, where the resistances are proportional to the velocities, it is usual to specify the resistance by a "modulus of decay," namely the time in which a velocity is reduced by friction to e^{-1} or $1/2\cdot78$ of its initial value. Now in order that the result contemplated by Laplace may be true, the friction must be such that the modulus of decay is short compared with the semi-period of oscillation. It seems certain that the friction of the ocean bed would not reduce a slow ocean current to one-third of its primitive value in a day or two. Hence we cannot accept Laplace's discussion as satisfactory, and the investigation which has just been given becomes necessary. (See § 34).

§ 18. *Tesseral Oscillations.*—The oscillations which we now have to consider are those in which the form of surface is expressible by the tesseral harmonics. The results will be applicable to the diurnal and semi-diurnal tides—Laplace's second and third species.

Transformation of Equation.

If we write $\sigma = s/f$ the equation (22) becomes

$$\frac{d}{d\theta}\left[\frac{\left(\sin\theta\frac{d}{d\theta}+\sigma\cos\theta\right)\Sigma b_iu_i}{s^2-\sigma^2\cos^2\theta}\right] - \frac{\left(\sigma\cos\theta\frac{d}{d\theta}+s^2\operatorname{cosec}\theta\right)\Sigma b_iu_i}{s^2-\sigma^2\cos^2\theta}$$
$$+\frac{4ma}{\gamma\sigma^2}\sin\theta\Sigma h_i = 0. \qquad (29)$$

If we write D for the operation $\sin\theta\frac{d}{d\theta}$, the middle term may be arranged in the form

$$-\frac{\sigma\cot\theta\,(D+\sigma\cos\theta)(\Sigma b_iu_i)}{s^2-\sigma^2\cos^2\theta} - \frac{\Sigma b_iu_i}{\sin\theta}.$$

Therefore on multiplying by $\sin\theta$ the equation becomes

$$(D-\sigma\cos\theta)\left[\frac{(D+\sigma\cos\theta)(\Sigma b_iu_i)}{s^2-\sigma^2\cos^2\theta}\right] - (\Sigma b_iu_i) + \frac{4ma}{\gamma\sigma^2}\sin^2\theta\Sigma h_i = 0. \qquad (30)$$

We now introduce two auxiliary functions, such that

$$\Sigma b_i(h_i - e_i) = \Sigma b_iu_i$$
$$= (D-\sigma\cos\theta)\Psi + (s^2-\sigma^2\cos^2\theta)\Phi. \qquad (31)$$

It is easy to prove that

$$\left.\begin{aligned}(D+\sigma\cos\theta)(D-\sigma\cos\theta) &= D^2-s^2+\sigma\sin^2\theta+(s^2-\sigma^2\cos^2\theta),\\ (D-\sigma\cos\theta)(D+\sigma\cos\theta) &= D^2-s^2-\sigma\sin^2\theta+(s^2-\sigma^2\cos^2\theta).\end{aligned}\right\} \quad (32)$$

Also

$$(D+\sigma\cos\theta)(s^2-\sigma^2\cos^2\theta)\,\Phi = (s^2-\sigma^2\cos^2\theta)(D+\sigma\cos\theta)\Phi$$
$$+2\sigma^2\sin^2\theta\cos\theta\,\Phi. \qquad (33)$$

Now perform $D+\sigma\cos\theta$ on (31), and use the first of (32) and (33), and we have

$$(D+\sigma\cos\theta)(\Sigma b_iu_i) = (D^2-s^2+\sigma\sin^2\theta+s^2-\sigma^2\cos^2\theta)\Psi.$$
$$+(s^2-\sigma^2\cos^2\theta)(D+\sigma\cos\theta)\Phi + 2\sigma^2\sin^2\theta\cos\theta\,\Phi. \qquad (34)$$

The functions Ψ and Φ are as yet indeterminate, and we may impose another condition on them. Let that condition be

$$(D^2-s^2+\sigma\sin^2\theta)\Psi = -2\sigma^2\sin^2\theta\cos\theta\,\Phi. \qquad (35)$$

Then (34) may be written

$$\frac{(D+\sigma\cos\theta)(\Sigma b_iu_i)}{s^2-\sigma^2\cos^2\theta} = \Psi + (D+\sigma\cos\theta)\Phi.$$

Substituting from this in (30), and using the second of (32), the function Ψ disappears and the equation reduces to

$$(D^2-s^2-\sigma\sin^2\theta)\Phi + \frac{4ma}{\gamma\sigma^2}\sin^2\theta\,\Sigma h_i = 0. \qquad (36)$$

Since by (35) $-\sigma^2\cos^2\theta\,\Phi = \frac{1}{2}\frac{\cos\theta}{\sin^2\theta}(D^2-s^2+\sigma\sin^2\theta)\Psi$, (31) may be written

$$\Sigma b_iu_i = \left[D-\sigma\cos\theta+\tfrac{1}{2}\frac{\cos\theta}{\sin^2\theta}(D^2-s^2+\sigma\sin^2\theta)\right]\Psi + s^2\Phi. \qquad (37)$$

The equations (35), (36) and (37) define Ψ and Φ, and furnish the equation which must be satisfied.

If we denote $\cos\theta$ by μ the zonal harmonics are defined by

$$P_i = \frac{1}{2^i i!}\left(\frac{d}{d\mu}\right)^i(\mu^2-1)^i.$$

The following are three well-known properties of zonal harmonics:

$$\frac{d}{d\mu}\left[(1-\mu^2)\frac{dP_i}{d\mu}\right] + i(i+1)P_i = 0, \qquad (38)$$

$$(i+1)P_{i+1} - (2i+1)\mu P_i + iP_{i-1} = 0, \qquad (39)$$

$$\frac{dP_{i+1}}{d\mu} - \frac{dP_{i-1}}{d\mu} = (2i+1)P_i. \qquad (40)$$

If $P_i^s \begin{smallmatrix}\cos\\ \sin\end{smallmatrix} s\phi$ are the two tesseral harmonics of order i and rank s, it is also known that

$$P_i^s = (1-\mu^2)^{\frac{1}{2}s}\frac{d^sP_i}{d\mu^s}. \qquad (41)$$

Let us now assume

$$h_i = C_i^sP_i^s, \quad e_i = E_i^sP_i^s, \quad \Psi = \Sigma\alpha_i^sP_i^s, \quad \Phi = \Sigma\beta_i^sP_i^s.$$

These must now be substituted in our three equations (35), (36), (37), and the result must be expressed by series of the P_i^s functions. It is clear then that we have to transform into P_i^s functions the following functions of P_i^s, namely

$$\frac{1}{\sin^2\theta}(D^2-s^2\pm\sigma\sin^2\theta)P_i^s, \quad \cos\theta P_i^s,$$
$$\left[D-\sigma\cos\theta+\tfrac{1}{2}\frac{\cos\theta}{\sin^2\theta}(D^2-s^2+\sigma\sin^2\theta)\right]P_i^s.$$

If we differentiate (38) s times, and express the result by means of the operator D, we find

$$(D^2-s^2)P_i^s + i(i+1)P_i^s\sin^2\theta = 0. \qquad (42)$$

Again, differentiating (39) s times and using (40), we find

$$(i-s+1)P_{i+1}^s - (2i+1)\cos\theta\,P_i^s + (i+s)P_{i-1}^s = 0. \qquad (43)$$

Lastly, differentiating (41) once and using (38), (40) and (43)

$$DP_i^s = \frac{i(i-s+1)}{2i+1}P_{i+1}^s - \frac{(i+1)(i+s)}{2i+1}P_{i-1}^s. \qquad (44)$$

By means of (42), (43) and (44) we have

$$\frac{1}{\sin^2\theta}(D^2-s^2\pm\sigma\sin^2\theta)P_i^s = [-i(i+1)\pm\sigma]P_i^s,$$

$$\cos\theta\,P_i^s = \frac{i+s}{2i+1}P_{i-1}^s + \frac{i-s+1}{2i+1}P_{i+1}^s,$$

$$\left[D-\sigma+\tfrac{1}{2}\frac{\cos\theta}{\sin^2\theta}(D^2-s^2+\sigma\sin^2\theta)\right]P_i^s = -\frac{(i-s+1)[\sigma+i(i-1)]}{2(2i+1)}P_{i+1}^s$$
$$-\frac{(i+s)[\sigma+(i+1)(i+2)]}{2(2i+1)}P_{i-1}^s.$$

Therefore the equations (35), (36), (37) give

$$\Sigma\left[\alpha_i^s\{-i(i+1)+\sigma\}P_i^s + 2\sigma^2\beta_i^s\left\{\frac{i+s}{2i+1}P_{i-1}^s + \frac{i-s+1}{2i+1}P_{i+1}^s\right\}\right] = 0,$$

$$\Sigma\left[\beta_i^s\{-i(i+1)-\sigma\}P_i^s + \frac{4ma}{\gamma\sigma^2}C_i^sP_i^s\right] = 0,$$

$$\Sigma\left[b_i(C_i^s-E_i^s)P_i^s + \alpha_i^s\left\{\frac{(i-s+1)[\sigma+i(i-1)]}{2(2i+1)}P_{i+1}^s\right.\right.$$
$$\left.\left.+\frac{(i+s)[\sigma+(i+1)(i+2)]}{2(2i+1)}P_{i-1}^s\right\} - \beta_i^s s^2P_i^s\right] = 0.$$

Since these equations must be true identically, the coefficients of P_i^s in each of them must vanish. Therefore

$$\left.\begin{aligned} a_i^s\{\sigma-i(i+1)\}+2\sigma^2\left\{\beta_{i+1}^s\frac{i+s+1}{2i+3}+\beta_{i-1}^s\frac{i-s}{2i-1}\right\}=0,\\ -\beta_i^s\{\sigma+i(i+1)\}+\frac{4ma}{\gamma\sigma^2}C_i^s=0,\\ b_i(C_i^s-E_i^s)+a_{i-1}^s\frac{(i-s)[\sigma+(i-1)(i-2)]}{2(2i-1)}\\ +a_{i+1}^s\frac{(i+s+1)[\sigma+(i+2)(i+3)]}{2(2i+3)}-\beta_i^s s^2=0.\end{aligned}\right\} \quad (45)$$

If we eliminate the a's and β's from the third equation (45), by means of the first two, we find

Solution for Tesseral Oscillations.

$$\xi_{i-2}^s C_{i-2}^s-L_i^s C_i^s+\eta_{i+2}^s C_{i+2}^s=\frac{\gamma b_i}{4ma}E_i^s, \quad (46)$$

where

$$L_i^s=\frac{s^2}{\sigma^2[\sigma+i(i+1)]}+\frac{(i^2-s^2)[\sigma+(i-1)(i-2)]}{(4i^2-1)[\sigma-(i-1)i][\sigma+i(i+1)]}+\frac{[(i+1)^2-s^2][\sigma+(i+2)(i+3)]}{[4(i+1)^2-1][\sigma-(i+1)(i+2)][\sigma+i(i+1)]}-\frac{\gamma b_i}{4ma}$$

$$\xi_{i-2}^s=\frac{-(i-s)(i-s-1)}{(2i-1)(2i-3)[\sigma-(i-1)i]},$$

$$\eta_{i+2}^s=\frac{-(i+s+1)(i+s+2)}{(2i+3)(2i+5)[\sigma-(i+1)(i+2)]}.$$

In the case of the luni-solar semi-diurnal tide (called K_2 in the notation of harmonic analysis) we have $i=2$, $s=2$, $\sigma=2$. Hence it would appear that these formulae for L_i^s and ξ_{i-2}^s fail by becoming indeterminate, but i and s are rigorously integers, whereas σ depends on the "speed" of the tide; accordingly in the case referred to we must regard terms involving $(i-s)$ as vanishing in the limit when σ approaches to equality with i $(i-1)$. For this particular case then we find

$$L_2^2=\frac{3}{35}-\frac{\gamma b_2}{4ma} \text{ and } \xi_0^s=0.$$

The equation (46) for the successive C's is available for all values of i provided that C_{-1}, E_{-1}, C_0, E_0 are regarded as being zero.

As in the case of the zonal oscillations, the equations with odd suffixes separate themselves from those with even suffixes, so that the two series may be treated independently of one another. Indeed, as we shall see immediately, the series with odd suffixes are satisfied by putting all the C's with odd suffixes zero for the case of such oscillations as may be generated by the attractions of the moon or sun.

For the semi-diurnal tides $i=2$, $s=2$, and f is approximately equal to unity. Hence the equilibrium tide is such that all the E_i^s, excepting E_2^2, are zero.

For the diurnal tides $i=2$, $s=1$, and f is approximately equal to $\frac{1}{2}$. Hence all the E_i^s, excepting E_2^1, are zero. Since in neither case is there any E with an odd suffix, we need only consider those with even suffixes.

In both cases the first equation among the C's is

$$-L_2^s C_2^s+\eta_4^s C_4^s=\frac{\gamma b_2}{4ma}E_2^s (s=2 \text{ or } 1).$$

It follows that if we write

$$\xi_0^s C_0^s=-\frac{\gamma b_2}{4ma}E_2^s (s=2 \text{ or } 1),$$

the equation of condition amongst the C's would be of general applicability for all even values of i from 2 upwards.

The symbols ξ^s_0, η^s_2 do not occur in any of the equations, and therefore we may arbitrarily define them as denoting unity, although the general formulae for ξ and η would give them other values. Accordingly we shall take

$$\xi_0^s C_0^s=C_0^s=-\frac{\gamma b_2}{4ma}E_2^s (s=2 \text{ or } 1).$$

With this definition the equation

$$\xi_{i-2}^s C_{i-2}^s-L_i^s C_i^s+\eta_{i+2}^s C_{i+2}^s=0 (s=2 \text{ or } 1)$$

is applicable for $i=2$, 4, 6, &c.

It may be proved as in the case of the tides of long period that we may regard C_i^s/C_{i+2}^s as tending to zero. Then our equation may be written in the form

$$\xi_{i-2}^s\frac{C_{i-2}^s}{C_i^s}=L_i^s-\frac{\xi_i^s\eta_{i+2}^s}{\xi_i^s C_i^s/C_{i+2}^s},$$

and by successive applications the right-hand side may be expressed in the form of a continued fraction. Let us write

$$H_i^s=\frac{\xi_{i-2}^s\eta_i^s}{L_i^s-}\,\frac{\xi_i^s\eta_{i+2}^s}{L_{i+2}^s-}\,\frac{\xi_{i+2}^s\eta_{i+4}^s}{L_{i+4}^s-}\cdots$$

Hence our equation may be written

$$\xi_{i-2}^s\frac{C_{i-2}^s}{C_i^s}=\frac{\xi_{i-2}^s\eta_i^s}{H_i^s}$$

Whence

$$C_i^s=\frac{H_i^s}{\eta_i^s}C_{i-2}^s.$$

It follows that

$$C_2^s=\frac{H_2^s}{\eta_2^s}C_0^s, \quad C_4^s=\frac{H_2^s H_4^s}{\eta_2^s\eta_4^s}C_0^s, \quad C_6^s=\frac{H_2^s H_4^s H_6^s}{\eta_2^s\eta_4^s\eta_6^s}C_0^s, \text{ \&c.}$$

Then since we have defined

$$\eta_2^s=1 \text{ and } C_0^s=-\frac{\gamma b_2}{4ma}E_2,$$

all the C's are expressed in terms of known quantities. Hence the height of tide $\mathfrak{b}$ is given by

$$\mathfrak{b}=\Sigma h_i\cos(2nft+s\phi+a)$$
$$=-\frac{\gamma b_2}{4ma}E_2^s\cos(2nft+s\phi+a)\left[H_2^s P_2^s+\frac{H_2^s H_4^s}{\eta_4^s}P_4^s+\frac{H_2^s H_4^s H_6^s}{\eta_4^s\eta_6^s}P_6^s\ldots\right]$$

But the equilibrium tide $\mathfrak{e}$ is given by

$$\mathfrak{e}=E_2^s P_2^s\cos(2nft+s\phi+a).$$

Hence we may write our result in the following form, which shows the relationship between the true dynamical tide and the equilibrium tide:—

$$\mathfrak{b}=-\frac{\gamma b_2}{4ma}\frac{\mathfrak{e}}{P_2^s}\left\{H_2^s P_2^s+\frac{H_2^s H_4^s}{\eta_4^s}P_4^s+\frac{H_2^s H_4^s H_6^s}{\eta_4^s\eta_6^s}P_6^s+\ldots\right\}$$

From a formula equivalent to this Mr Hough finds for the lunar semi-diurnal tide $(s=2)$, for a sea of 1210 fathoms $\left(\frac{\gamma}{4ma}=\frac{1}{40}\right)$,

$$\mathfrak{b}=\frac{\mathfrak{e}}{P_2^2}\left\{\cdot 10396P_2^2+\cdot 57998P_4^2-\cdot 19273P_6^2+\cdot 03054P_8^2\ldots\right\}.$$

This formula shows us that at the equator the tide is "inverted," and has 2·4187 times as great a range as the equilibrium tide.

For this same ocean he finds that the solar semi-diurnal tide is "direct" at the equator, and has a range 7·9548 as great as the equilibrium tide.

Now the lunar equilibrium tide is 2·2 times as great as the solar equilibrium tide, and since 2·2×2·4187 is only 5·3, it follows that in such an ocean the solar tides would have a range half as great again as the lunar. Further, since the lunar tides are "inverted" and the solar "direct," spring tide would occur at quarter moon and neap tide at full and change.

We give one more example from amongst those computed by Mr Hough. In an ocean of 9680 fathoms $(\gamma/4ma=1/5)$, he finds

$$\mathfrak{b}=\frac{\mathfrak{e}}{P_2^2}\left\{1\cdot 7646P_2^2-\cdot 06057P_4^2+\cdot 001447P_6^2\ldots\right\}.$$

At the equator the tides are "direct" and have a range of 1·9225 as great as the equilibrium tide. In this case the tides approximate in type to those of the equilibrium theory, although at the equator, at least, they have nearly twice the range.

We do not give any numerical results for the diurnal tides, for reasons which will appear from the following section.

§ 19. *Diurnal Tide approximately evanescent.*—The equilibrium diurnal tide is given by

$$\mathfrak{e}=E_2^1 P_2^1\cos(2nft+\phi+a),$$

where f is approximately $\frac{1}{2}$ and the associated function for $i=2$, $s=1$ is

$$P_2^1=3\sin\theta\cos\theta.$$

Now the height of tide is given by

$$\mathfrak{b}=\Sigma C_i^s P_i^s\cos(2nft+\phi+a),$$

and the problem is to evaluate the constants C_i^s.

If possible suppose that $\mathfrak{b}$ is also expressed by a single term like that which represents $\mathfrak{e}$, so that

$$\mathfrak{b}=3C_2^1\sin\theta\cos\theta\cos(2nft+\phi+a).$$

Then the differential equation (22) to be satisfied becomes

$$\gamma(C_2^1-E_2^1)\left\{\frac{1}{\sin\theta}\frac{d}{d\theta}\left(\frac{\sin\theta\frac{du}{d\theta}+\frac{1}{f}u\cos\theta}{f^2-\cos^2\theta}\right)-\frac{\frac{\cos\theta}{f}\frac{du}{d\theta}+\frac{u}{\sin\theta}}{\sin\theta(f^2-\cos^2\theta)}\right\}+4ma\,C_2^1 u=0,$$

where u is written for brevity in place of $\sin\theta\cos\theta$.

Now when f is rigorously equal to $\frac{1}{2}$, it may be proved by actual differentiation that the expression inside the brackets { } vanishes identically, and the equation reduces to $C_2^1=0$.

We thus find that in this case the differential equation is satisfied by zero oscillation of water-level. In other words we reach Laplace's remarkable conclusion that there is no diurnal rise and fall of the tides. There are, it is true, diurnal tidal currents, but they are so arranged that the water level remains unchanged.

In reality f is not rigorously $\frac{1}{2}$ (except for the tide called K_2) and there will be a small diurnal tide. The lunar diurnal tide called O has been evaluated for various depths of ocean by Mr Hough and is found always to be small.

§ 20. *Free Oscillations of the Ocean.*—Mr Hough discusses the various types of free oscillations of the ocean. They are very complex, and consist of westward waves and eastward waves of very various periods. He finds, as was to be expected, that if, for an ocean of given depth, a free wave very nearly coincides in period with the forced lunar or solar wave, the actual tide is largely augmented. Thus, for example, for an ocean of 29,000 ft. in depth the solar semi-diurnal tide would have a height at the equator 235 times as great as the equilibrium height, and would be inverted so that low water would agree with the high water of the equilibrium theory.

The general outcome of the discussion is that it is impossible to foresee the height of any forced tide-wave by mere general inspection. If this is so in the simple case of an ocean of uniform depth, how much more must it be true of oceans of various depths interrupted by continents?

§ 21. *Stability of the Ocean.*—Imagine a globe of density δ, surrounded by a spherical layer of water of density σ. Then, still maintaining the spherical figure, and with water still covering the nucleus, let the layer be displaced sideways. The force on any part of the water distant r' from the centre of the water and r from the centre of the nucleus is $\frac{4}{3}\pi\sigma r'$ towards the centre of the fluid sphere and $\frac{4}{3}\pi(\delta-\sigma)r$ towards the centre of the nucleus. If δ be greater than σ there is a force tending to carry the water from places where it is deeper to places where it is shallower; and therefore the equilibrium, thus arbitrarily disturbed, is stable. If, however, δ is less than σ (or the nucleus lighter than water) the force is such that it tends to carry the water from where it is shallower to where it is deeper and therefore the equilibrium of a layer of fluid distributed over a nucleus lighter than itself is unstable. As Lord Kelvin remarks,[1] if the nucleus is lighter than the ocean, it will float in the ocean with part of its surface dry. Suppose, again, that the fluid layer be disturbed, so that its equation is $r=a(1+s_i)$, where s_i is a surface harmonic of degree i; then the potential due to this deformation is $\frac{4\pi\sigma}{2i+1}\frac{a^{i+3}}{r^{i+1}}s_i$, and the whole potential is

Stabilities of Various Orders.

$$\frac{4\pi\delta a^3}{3r}+\frac{4\pi\sigma}{2i+1}\frac{a^{i+3}}{r^{i+1}}s_i.$$

If, therefore, $\sigma/(2i+1)$ is greater than $\frac{1}{3}\delta$, the potential of the forces due to deformation is greater than that due to the nucleus. But we have seen that a deformation tends to increase itself by mutual attraction, and therefore the forces are such as to increase the deformation. If, therefore, $\sigma=\frac{1}{3}(2i+1)\delta$, all the deformations up to the ith are unstable, but the $(i+1)$th is stable.[2] If, however, σ be less than δ, then all the deformations of any order are such that there are positive forces of restitution. For our present purpose it suffices that the equilibrium is stable when the fluid is lighter than the nucleus.

§ 22. *Precession and Nutation.*—Suppose we have a planet covered with a shallow ocean, and that the ocean is set into oscillation. Then, if there are no external disturbing forces, so that the oscillations are "free," not "forced," the resultant moment of momentum of the planet and ocean remains constant. And, since each particle of the ocean executes periodic oscillations about a mean position, it follows that the oscillation of the ocean imparts to the solid earth oscillations such that the resultant moment of momentum of the whole system remains constant. But the mass of the ocean being very small compared with that of the planet, the component angular velocities of the planet necessary to counterbalance the moment of momentum of the oscillations of the sea are very small compared with the component angular velocities of the sea, and therefore the disturbance of planetary rotation due to oceanic reaction is negligible. If now an external disturbing force, such as that of the moon, acts on the system, the resultant moment of momentum of sea and earth is unaffected by the interaction between them, and the precessional and nutational couples are the same as if sea and earth were rigidly connected together. Therefore the additions to these couples on account of tidal oscillation are the couples due to the attraction of the moon on the excess or deficiency of water above or below mean sea-level. The tidal oscillations are very small in height compared with the equatorial protuberance of the earth, and the density of water is $\frac{4}{11}$ths of that of surface rock; hence the additional couples are very small compared with the couples due to the moon's action on the solid equatorial protuberance. Therefore precession and nutation take place sensibly as though the sea were congealed in its mean position. If the ocean be regarded as frictionless, the principles of energy show us that these insensible additional couples must be periodic in time, and thus the corrections to nutation must consist of semi-diurnal, diurnal and fortnightly nutations of absolutely insensible magnitude. We shall have much to say below on the results of the introduction of friction into the conception of tidal oscillations as a branch of speculative astronomy.

Corrections to Precession and Nutation Insensible.

§ 23. *Some Phenomena of Tides in Rivers.*—As a considerable part of our practical knowledge of tides is derived from observations in estuaries and rivers, we shall state the results of an investigation of waves which travel along a shallow canal, and we refer the reader to the article WAVES for the mathematical investigations on which they are based.

It must be premised that when the profile of a wave does not present the simple harmonic form, it is convenient to analyse its shape into a series of partial waves superposed on a fundamental wave; and generally the principle of harmonic analysis is adopted in which the actual wave is regarded as the sum of a number of simple waves.

Suppose that the water is contained in a straight and shallow canal of uniform depth h, and that at one end the canal debouches on to the open sea. Suppose further that in the open sea there is a forced oscillation of water level, given by this formula

$$\eta=H\sin nt$$

where η is the elevation of the water at time t above its mean level, $2\pi/n$ the period of the oscillation and H the amplitude of the oscillation.

Waves will clearly be transmitted along the canal, and the problem is to obtain a formula which shall represent the oscillations of level at any distance x measured from the mouth of the canal.

The mathematical investigation shows that, if g denotes gravity, the formula for the oscillation of water level at the point defined by x is

$$\eta=H\sin n\left(t-\frac{x}{\sqrt{gh}}\right)+\frac{3H^2n}{4h\sqrt{gh}}x\sin 2n\left(t-\frac{x}{\sqrt{gh}}\right).$$

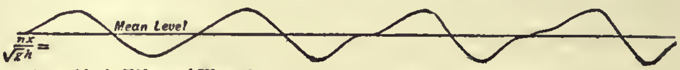
The second of these terms is proportional to x, and if the canal were infinitely long it would become infinite. The difficulty thus occasioned may be eluded by supposing the canal to debouch on a second sea in which a second appropriate oscillation is maintained. In actuality friction gradually annuls all motion, and no such difficulty arises.

The first term of the formula is called the fundamental tide, the second gives what is called the first over-tide; and further approximation would give second and third over-tides, &c. All the over-tides travel up the river at the same rate as the fundamental, but they have double, treble, quadruple frequencies or "speeds," and the ratio of the amplitude of the first over-tide to the fundamental is

$$\frac{3H}{4h}\frac{nx}{\sqrt{gh}}.$$

As a numerical example, let the range of tide at the river mouth be 20 ft., and the depth of the river 50 ft. The "speed" of the semi-diurnal tide, which is an angular velocity, is 28·98° per hour or 1/1·9 radians per hour; $\sqrt{gh}=27$ miles per hour; hence $\frac{3H}{4h}\frac{nx}{\sqrt{gh}}=\frac{1}{342}x.$ Therefore 34 miles up the river the over-tide is 1/10th of the fundamental and has a range of 2 ft. If the river shallows very gradually, the formula wiil still hold, and we see that the height of the over-tide varies as $(\text{depth})^{-\frac{3}{2}}$.

Fig. 6[3] read from left to right exhibits the progressive change of shape. The steepness of the advancing crest shows that a shorter



(From Airy's *Tides and Waves.*)

FIG. 6.—Tide Wave in Rivers.

time elapses between low to high water than inversely. The same investigation shows that the law of the ebb and flow of currents, mentioned in § 2, must hold good.

The second law of waves in rivers to which we draw attention relates to the effects produced by the simultaneous propagation into shallow water of two waves of different periods. It appears that the effect is not simply the summation of the two separate waves.

Suppose that at the mouth of the river the oscillation of the open sea is represented by

$$\eta=H_1\sin n_1t+H_2\sin(n_2t+\epsilon).$$

Then we find that at distance x from the river's mouth the wave is given by the formula

$$\begin{aligned}\eta = H_1\sin n_1\left(t-\frac{x}{\sqrt{gh}}\right)&+H_2\sin\left[n_2\left(t-\frac{x}{\sqrt{gh}}\right)+\epsilon\right]\\ &+\frac{3H_1H_2}{4h}\frac{n_1+n_2}{\sqrt{gh}}x\sin\left[(n_1+n_2)\left(t-\frac{x}{\sqrt{gh}}\right)+\epsilon\right]\\ &-\frac{3H_1H_2}{4h}\frac{n_1-n_2}{\sqrt{gh}}x\sin\left[(n_1+n_2)\left(t-\frac{x}{\sqrt{gh}}\right)+\epsilon\right].\end{aligned}$$

The first two terms give us the two waves just as if each existed by itself. The third and fourth terms give the results of their combination, and are called "compound" tides, the first being a summation tide and the second a difference tide.

As a numerical example, suppose at the mouth of a river 50 ft. deep that the solar semi-diurnal tide has a range $2H_1=4$ ft., and the lunar semi-diurnal tide has a range $2H_2=12$; then $n_1+n_2=59/57$ radians per hour, and $n_1-n_2=1/57$ radians per hour, and as before $\sqrt{gh}=27$ miles per hour.

With these figures

$$\frac{3H_1H_2}{4h}\frac{n_1+n_2}{\sqrt{gh}}x=\frac{1}{170}x.$$

[1] Thomson and Tait, *Nat. Phil.* § 816.

[2] Compare an important paper by H. Poincaré, in *Acta math.* (1885), 7; 3, 4.

[3] From Airy's *Tides and Waves*, with omission of part which was erroneous.

Thus 15 miles up the river the quater-diurnal tide (called MS in harmonic analysis) would have a range of 1/60 of an inch. Where the two interacting compound tides are nearly of the same "speed" the summational compound tide is much the larger of the two. As before, when the river shallows gradually this formula will still hold true.

It is interesting to note the kind of effect produced by these compound tides. When the primary tides are in the same phase (as at spring tide)

$$n_1 t = n_2 t + \epsilon,$$

and we may write the formula in the form

$$\eta = (H_1+H_2)\sin n_1\left(t-\frac{x}{\sqrt{gh}}\right) + \frac{3H_1H_2}{4h}\frac{n_1+n_2}{\sqrt{gh}}x\sin\left[2n_1t-\frac{(n_1+n_2)x}{\sqrt{gh}}\right] + \frac{3H_1H_2}{4h}\frac{n_1-n_2}{\sqrt{gh}}x\sin\frac{(n_1-n_2)x}{\sqrt{gh}}.$$

Hence the front slope of the tide-wave is steeper at springs than at neaps, and the compound tide shows itself at springs in the form of an augmentation of the first over-tide; the converse holds at neaps. Also mean water-mark is affected to a slight extent as we go up the river by an inequality represented by the last term.

IV.—Harmonic Analysis

§ 24. *Outline of the Method.*—We have seen in § 13 that the potential of the tide-generating force of the moon consists of three terms, one being approximately semi-diurnal, one approximately diurnal, and one varying slowly. In consequence of the irregular motion of the moon in right ascension and in declination and the variability of parallax, none of these three classes of terms is simply harmonic in time. The like is also true of the potential of the sun's tide-generating force. In the method of harmonic analysis we conceive the tidal forces or potential due to each disturbing body to be developed in a series of terms each consisting of a constant (determined by the elements of the planet's orbit and the obliquity of the ecliptic) multiplied by a simple harmonic function of the time. Thus in place of the three terms of the potential as developed in § 13 we have an indefinitely long series of terms for each of the three terms. The loss of simplicity in the expression for the forces is far more than counterbalanced by the gain of facility for the discussion of the oscillations of the water. This facility arises from the dynamical principle of forced oscillations, which we have explained in the historical sketch. Applying this principle, we see that each individual term of the harmonic development of the tide-generating forces corresponds to an oscillation of the sea of the same period, but the amplitude and phase of that oscillation must depend on a network of causes of almost inextricable complication. The analytic or harmonic method, then, represents the tide at any port by a series of simple harmonic terms whose periods are determined from theoretical considerations, but whose amplitudes and phases are found from observation. Fortunately the series representing the tidal forces converges with sufficient rapidity to permit us to consider only a moderate number of harmonic terms in the series.

Now it seems likely that the corrections which have been applied in the use of the older synthetic method might have been clothed in a more satisfactory and succinct mathematical form had investigators first carried out the harmonic development. In this article we shall therefore invert history and come back on the synthetic method from the analytic, and shall show how the formulae of correction stated in harmonic language may be made comparable with them in synthetic language. One explanation is expedient before proceeding with the harmonic development. There are certain terms in the tide-generating forces of the moon, depending on the longitude of the moon's nodes, which complete their revolution in 18·6 years. Now it has been found practically convenient, in the application of the harmonic method, to follow the synthetic plan to the extent of classifying together terms whose periods differ only in consequence of the movement of the moon's node, and at the same time to conceive that there is a small variability in the intensity of the generating forces.

Fusion of Terms affected by Motion of Moon's Node.

§ 25. *Development of Equilibrium Theory of Tides in Terms of the Elements of the Orbits.*—Within the limits at our disposal we cannot do more than indicate the processes to be followed in this development. We have already seen in (2) that the expression for the moon's tide-generating potential is

$$V = \frac{3m}{2r^3}\rho^2(\cos^2 z - \tfrac{1}{3}),$$

and in (12) that

$$\cos^2 z - \tfrac{1}{3} = 2\xi\eta M_1M_2 + 2\frac{\xi^2-\eta^2}{2}\cdot\frac{M_1^2-M_2^2}{2} + 2\eta\zeta M_2M_3 + 2\xi\zeta M_1M_3 + \frac{3}{2}\,\frac{\xi^2+\eta^2-2\zeta^2}{3}\cdot\frac{M_1^2+M_2^2-2M_3^2}{3},$$

where M_1, M_2, M_3 and ξ, η, ζ are respectively the direction cosines referred to axes fixed in the earth of the moon and of a place on the earth's surface at which the potential V is to be evaluated. At such a place the radius vector ρ is equal to a the earth's radius.

Let the axes fixed in the earth be taken as follows: the axis C the north polar axis; the axis A through the earth's centre and a point on the equator on the same meridian as the place of observation; the axis B at right angles to the other two and eastward of A. Then if λ be the latitude of the place of observation

$$\xi = \cos\lambda,\ \eta = 0,\ \zeta = \sin\lambda.$$

With these values we have

$$\cos^2 z - \tfrac{1}{3} = \tfrac{1}{2}\cos^2\lambda(M_1^2-M_2^2) + \sin 2\lambda\,.\,M_1M_2 + \tfrac{1}{2}(\tfrac{1}{3}-\sin^2\lambda)(M_1^2+M_2^2-2M_3^2).$$

In fig. 7 let ABC be the axes fixed in the earth; XYZ a second set of axes, XY being the plane of the moon's orbit; M the projection of the moon in her orbit; I=ZC, the obliquity of the lunar orbit to the equator; χ=AX=BCY; l=MX, the moon's longitude in her orbit measured from X, the descending node of the equator on the lunar orbit, hereafter called the "intersection."

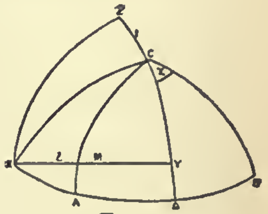


Fig. 7.

Then

$$M_1 = \cos l\cos\chi + \sin l\sin\chi\cos I = \cos^2\tfrac{1}{2}I\cos(\chi-l) + \sin^2\tfrac{1}{2}I\cos(\chi+l),$$

$$M_2 = -\cos l\sin\chi + \sin l\cos\chi\cos I = -\cos^2\tfrac{1}{2}I\sin(\chi-l) - \sin^2\tfrac{1}{2}I\sin(\chi+l),$$

$$M_3 = \sin l\sin I = 2\sin\tfrac{1}{2}I\cos\tfrac{1}{2}I\sin l.$$

When these expressions are substituted in $M_1^2-M_2^2$, M_1M_3, $M_1^2+M_2^2-2M_3^2$, it is clear that the first will have terms in the cosines of $2(\chi-l)$, 2χ, $2(\chi+l)$; the second in sines of $\chi-2l$, χ, $\chi+2l$; and the third in cos $2l$, together with a term depending only on I.

Now let c be the moon's mean distance, e the eccentricity of her orbit, and let

$$X = \left[\frac{c(1-e^2)}{r}\right]^{\frac{3}{2}}M_1,\ Y = \left[\frac{c(1-e^2)}{r}\right]^{\frac{3}{2}}M_2,\ Z = \left[\frac{c(1-e^2)}{r}\right]^{\frac{3}{2}}M_3,$$

and $\tau = \dfrac{3m}{2c^3}$.

Then we have for the lunar tide-generating potential at the place of observation

Tide-generating Potential.

$$V = \frac{\tau a^2}{(1-e^2)^3}[\tfrac{1}{2}\cos^2\lambda\,.\,(X^2-Y^2) + \sin 2\lambda\,.\,XZ + \tfrac{1}{2}(\tfrac{1}{3}-\sin^2\lambda)(X^2+Y^2-2Z^2) \tag{47}$$

The only parts of this expression which are variable in time are the functions of X, Y, Z.

To complete the development the formulae of elliptic motion are introduced in these functions, and terms which appear numerically negligible are omitted. Finally, the three X-Y-Z functions are obtained as a series of simple time-harmonics, the arguments of the sines and cosines being linear functions of the earth's rotation, the moon's mean motion, and the longitude of the moon's perigee. The next step is to pass, according to the principle of forced oscillations, from the potential to the height of tide generated by the forces corresponding to that potential. The X-Y-Z functions being simple time-harmonics, the principle of forced oscillations allows us to conclude that the forces corresponding to V in (47) will generate oscillations in the ocean of the same periods and types as the terms in V, but of unknown amplitudes and phases. Now let $\mathfrak{X}^2-\mathfrak{Y}^2$, $\mathfrak{X}\mathfrak{Z}$, $(\mathfrak{X}^2+\mathfrak{Y}^2-2\mathfrak{Z}^2)$ be three functions having respectively similar forms to those of

$$\frac{X^2-Y^2}{(1-e^2)^3},\ \frac{XZ}{(1-e^2)^3},\ \text{and}\ \frac{(X^2+Y^2-2Z^2)}{(1-e^2)^3},$$

but differing from them in that the argument of each of the simple time-harmonics has some angle subtracted from it, and that the term is multiplied by a numerical factor. Then, if g be gravity and h the height of tide at the place of observation, we must have

Height of Tide at any Port.

$$h = \frac{\tau a^2}{g}[\tfrac{1}{2}\cos^2\lambda(\mathfrak{X}^2-\mathfrak{Y}^2) + \sin 2\lambda\mathfrak{X}\mathfrak{Z} + \tfrac{3}{2}(\tfrac{1}{3}-\sin^2\lambda)\tfrac{1}{3}(\mathfrak{X}^2+\mathfrak{Y}^2-2\mathfrak{Z}^2)]. \tag{48}$$

The factor $\tau a^2/g$ may be more conveniently written $\dfrac{3m}{2M}\left(\dfrac{a}{c}\right)^3 a$, where M is the earth's mass. It has been so chosen that, if the equilibrium theory of tides were fulfilled, with water covering the whole earth, the numerical factors in the $\mathfrak{X}$-$\mathfrak{Y}$-$\mathfrak{Z}$ functions would be each unity and the alterations of phase would be zero. The terms in $(\mathfrak{X}^2+\mathfrak{Y}^2-2\mathfrak{Z}^2)$ require special consideration. The function of the latitude being $\tfrac{1}{3}-\sin^2\lambda$, it follows that, when in the northern hemisphere it is high-water north of a certain critical latitude, it is low-water on the opposite side of that parallel; and the same is true of the southern hemisphere. It is best to adopt a uniform system for the whole earth, and to regard high-tide and high-water as

Definition of High Tide of Tide of Long Period.

consentaneous in the equatorial belt, and of opposite meanings outside the critical latitudes. We here conceive the function always to be written $\frac{1}{3}-\sin^2\lambda$, so that outside the critical latitudes high-tide is low-water. We may in continuing the development write the $\mathfrak{X}$-$\mathfrak{Y}$-$\mathfrak{Z}$ functions in the form appropriate to the equilibrium theory with water covering the whole earth, for the actual case it is only then necessary to multiply by the reducing factor, and to subtract the phase alteration κ. As these are unknown constants for each place, they would only occur in the development as symbols of quantities to be deduced from observation. It will be understood, therefore, that in the following schedules the "argument" is that part of the argument which is derived from theory, the true complete argument being the "argument" $-\kappa$, where κ is derived from observation.

Up to this point we have supposed the moon's longitude and the earth's position to be measured from the "intersection"; but in order to pass to the ordinary astronomical formulae we must measure the longitude and the earth's position from the vernal equinox. Hence we determine the longitude and right ascension of the "intersection" in terms of the longitude of the moon's node and the inclination of the lunar orbit, and introduce them into our formulae for the $\mathfrak{X}$-$\mathfrak{Y}$-$\mathfrak{Z}$ functions. The expressions for the functions corresponding to solar tides may be written down by symmetry, and in this case the intersection is actually the vernal equinox.

Explanation of Schedules below.

The final result of the process sketched is to obtain a series of terms each of which is a function of the elements of the moon's or sun's orbit, and a function of the terrestrial latitude of the place of observation, multiplied by the cosine of an angle which increases uniformly with the time. We shall now write down the result in the form of a schedule; but we must first state the notation employed: e, $e_{,}$ = eccentricities of lunar and solar orbits; I, ω = obliquities of equator to lunar orbit and ecliptic; p, $p_{,}$ = longitudes of lunar and solar perigees, ϖ, $\varpi_{,}$ = hourly increments of p, $p_{,}$; s, h = moon's and sun's mean longitudes; σ, η = hourly increments of s, h; t = local mean solar time reduced to angle; $\gamma-\eta=15^\circ$ per hour; λ = latitude of place of observation; ξ, ν = longitude in lunar orbit, and R.A. of the intersection; N = longitude of moon's node; i = inclination of lunar orbit. The "speed" of any tide is defined as the rate of increase of its argument, and is expressible, therefore, as a linear function of γ, η, σ, ϖ; for we may neglect $\varpi_{,}$ as being very small.

Speed Defined.

The following schedules, then, give h the height of tide. The arrangement is as follows. First, there is a universal coefficient $\frac{3}{2}\frac{m}{M}\left(\frac{a}{c}\right)^3 a$, which multiplies every term of all the schedules. Secondly, there are general coefficients, one for each schedule, viz. $\cos^2\lambda$ for the semi-diurnal terms, $\sin 2\lambda$ for the diurnal, and $\frac{1}{2}-\frac{3}{2}\sin^2\lambda$ for the terms of long period. In each schedule the third column, headed "coefficient," gives the functions of I and e. In the fourth column is given the mean semi-range of the corresponding term in numbers, which is approximately the value of the coefficient in the first column when $I=\omega$; but we pass over the explanation of the mode of computing the values. The fifth column contains arguments, linear functions of t, h, s, p, ν, ξ. In [A, i.] $2t+2(h-\nu)$ and in [A, ii.] $t+(h-\nu)$ are common to all the arguments. The arguments are grouped in a manner convenient for subsequent computation. Lastly, the sixth is a column of speeds, being the hourly increases of the arguments in the preceding column, estimated in degrees per hour. It has been found practically convenient to denote each of these partial tides by an initial letter, arbitrarily chosen. In the first column we give a descriptive name for the tide, and in the second the arbitrarily chosen initial.

The schedule for the solar tides is drawn up in precisely the same manner, the only difference being that the coefficients are absolute constants. In order that the comparison of the importance of the solar tides with the lunar may be complete, the same universal coefficient $\frac{3}{2}\frac{m}{M}\left(\frac{a}{c}\right)^3 a$ is retained, and the special coefficient for each term is made to involve the factor $\frac{\tau_{,}}{\tau}$. Here $\tau_{,}=\frac{3}{2}\frac{m_{,}}{c_{,}^3}$, $m_{,}$ being the sun's mass. With

$$\frac{M}{m}=81{\cdot}5,\ \frac{\tau_{,}}{\tau}={\cdot}46035=\frac{1}{2{\cdot}17226}.$$

Mode of Reading Schedules Explained.

To write down any term, take the universal coefficient, the general coefficient for the class of tides, the special coefficient, and multiply by the cosine of the argument. The result, taken with the positive sign, is a term in the equilibrium tide, with water covering the whole earth. The transition to the actual case by the introduction of a factor and a delay of phase (to be derived from observation) has been already explained. The sum of all the terms is the complete expression for the height of tide h.

It must be remarked that the schedule of tides is here largely abridged, and that the reader who desires fuller information must refer to the *Brit. Assoc. Report* for 1883, or vol. i. of G. H. Darwin's *Scientific Papers*, or to Harris's *Manual of Tides*.

A.—*Schedule of Lunar Tides.*

$$\text{Universal Coefficient}=\frac{3}{2}\frac{m}{M}\left(\frac{a}{c}\right)^3 a.$$

i.—Semi-diurnal Tides; General Coefficient = $\cos^2\lambda$.					
Descriptive Name.	Initial.	Coefficient.	Mean Value of Coefficient.	Argument $2t+2(h-\nu.)$	Speed in Degrees per m. s. Hour.
Principal lunar.	M_2	$\frac{1}{2}(1-\frac{5}{2}e^2)\cos^4\frac{1}{2}I$	·45426	$-2(s-\xi)$	28·9841042°
Luni-solar (lunar portion)	K_2	$\frac{1}{2}(1+\frac{3}{2}e^2)\frac{1}{2}\sin^2 I$	·03929	—	30·0821372°
Larger elliptic	N	$\frac{1}{2}\cdot\frac{7}{2}e\cos^4\frac{1}{2}I$	·08706	$-2(s-\xi)-(s-p)$	28·4397296°

ii.—Diurnal Tides; General Coefficient = $\sin 2\lambda$.					
Descriptive Name.	Initial.	Coefficient.	Mean Value of Coefficient.	Argument $t+(h-\nu)$.	Speed in Degrees per m.s. Hour.
Lunar diurnal	O	$(1-\frac{5}{2}e^2)\frac{1}{2}\sin I\cos^2\frac{1}{2}I$	·18856	$-2(s-\xi)+\frac{1}{2}\pi$	13·9430356°
Luni-solar (lunar portion)	K_1	$(1+\frac{3}{2}e^2)\frac{1}{2}\sin I\cos I$	·18115	$-\frac{1}{2}\pi$	15·0410686°
Larger elliptic	Q	$\frac{7}{2}e\cdot\frac{1}{2}\sin I\cos^2\frac{1}{2}I$	·03651	$\left\{-2(s-\xi)-(s-p)+\frac{1}{2}\pi\right\}$	13·3986609°

iii.—Long Period Tides; General Coefficient $\frac{1}{2}-\frac{3}{2}\sin^2\lambda$.					
Descriptive Name.	Initial.	Coefficient.	Mean Value of Coefficient.	Argument.	Speed in Degrees per m.s. Hour.
Change of mean level.	—	$(1+\frac{3}{2}e^2)\frac{1}{2}(1-\frac{3}{2}\sin^2 I)$	·25224[1]	Of variable part is N, the long. of node	29·34° per annum
Fortnightly.	Mf	$(1-\frac{5}{2}e^2)\frac{1}{2}\sin^2 I$	·07827	$2(s-\xi)$	1·0980330°

B.—*Schedule of Solar Tides.*

$$\text{Universal Coefficient}=\frac{3}{2}\frac{M}{m}\left(\frac{a}{c}\right)^3 a.$$

Descriptive Name.	Initial.	Coefficient.	Value of Coefficient.	Argument.	Speed in Degrees per m.s. Hour.
i.—Semi-diurnal Tides; General Coefficient = $\cos^2\lambda$.					
Principal solar	S_2	$\frac{\tau_{,}}{\tau}(1-\frac{5}{2}e_{,}^2)\frac{1}{2}\cos^4\frac{1}{2}\omega$	·22137	$2t$	30·0000000°
Luni-solar (solar portion)	K_2	$\frac{\tau_{,}}{\tau}(1+\frac{3}{2}e_{,}^2)\frac{1}{4}\sin^2\omega$	·01823	$2t+2h$	30·0821372°
Larger elliptic	T	$\frac{\tau_{,}}{\tau}\frac{1}{2}\,\frac{7}{2}e_{,}\cos^4\frac{1}{2}\omega$	·01243	$2t-(h-p_{,})$	29·9589324°
ii.—Diurnal Tides; General Coefficient = $\sin 2\lambda$.					
Solar diurnal	P	$\frac{\tau_{,}}{\tau}(1-\frac{5}{2}e_{,}^2)\frac{1}{2}\sin\omega\cos^2\frac{1}{2}\omega$	·08775	$t-h+\frac{1}{2}\pi$	14·9589314°
Luni-solar (solar portion)	K_1	$\frac{\tau_{,}}{\tau}(1+\frac{3}{2}e_{,}^2)\frac{1}{2}\sin\omega\cos\omega$	·08407	$t+h-\frac{1}{2}\pi$	15·0410686°
iii.—Long Period Tides; General Coefficient = $\frac{1}{2}-\frac{3}{2}\sin^2\lambda$					
Semi-annual	Ssa	$\frac{\tau'}{\tau}(1-\frac{5}{2}e_{,}^2)\frac{1}{2}\sin^2\omega$	·03643	$2h$	0·0821372°

From the fourth columns we see that the coefficients in descending order of magnitude are M_2, K_1 (both combined), S_2, O, K_1 (lunar), N, P, K_1 (solar) K_2 (both combined), K_2 (lunar), Mf, Q, K_2 (solar), Ssa.

Scale of Importance of Tides.

The tides which we omit from the schedules are relatively unimportant, but nevertheless commonly evaluated in accurate tidal work, are all lunar tides, viz. the following semi-diurnal tides: the smaller elliptic tide L, the larger and smaller evectional tides ν, λ, the variational tide μ. Also the following diurnal tides, viz. the smaller elliptic tide M_1, a tide of speed $\gamma+\sigma-\varpi$ called J. Also amongst the tides of long period, the luni-solar fortnightly called MSf.

The tides depending on the fourth power of the moon's parallax

[1] The mean value of this coefficient is $\frac{1}{2}(1+\frac{3}{2}e^2)(1-\frac{3}{2}\sin^2 i)(1-\frac{3}{2}\sin^2\omega)$ $={\cdot}25$, and the variable part is approximately $-(1+\frac{3}{2}e^2)\sin i\cos i\sin\omega$ $\cos\omega\cos N=-\ {\cdot}0328\cos N$.

arise from the potential $V=\frac{m}{r^4}\rho^3(\frac{5}{2}\cos^3 z-\frac{3}{2}\cos z)$. They give rise to a small diurnal tide M_1, and to a small ter-diurnal tide M_3; but we shall not give the analytical development.

§ 26. *Over-Tides, Compound Tides and Meteorological Tides.*—We have in § 23 stated results derived from dynamical theory as to over-tides, which represent the change of profile of the wave as it advances in shallow water. The only tides in which it has hitherto been thought necessary to represent this change of form belong to the principal lunar and principal solar series. Thus, besides the fundamental astronomical tides M_2 and S_2, the over-tides M_4, M_6, M_8 and S_4, S_6 are usually deduced by harmonic analysis.

Over-Tides.

Compound tides have been also referred to in § 23; they represent a result of the combination of two waves of different speeds travelling through shallow water. On combining the speeds of the important tides, it will be found that there is in many cases a compound tide which has itself a speed identical with that of an astronomical or meteorological tide. We thus find that the tides O, K_1, P, M_2, Mf, Q, M_1, L are liable to perturbation in shallow water. We refer to the *Brit. Assoc. Report* for 1883 or to Harris's *Manual* for a schedule, with initials, of the compound tides which are usually evaluated.

Compound Tides.

All tides whose period is an exact multiple or submultiple of a mean solar day, or of a tropical year, are affected by meteorological conditions. Thus all the tides of the principal solar astronomical series S, with speeds $\gamma-\eta$, $2(\gamma-\eta)$, $3(\gamma-\eta)$, &c., are subject to more or less meteorological perturbation. An annual inequality in the diurnal meteorological tide S_1 will also give rise to a tide $\gamma-2\eta$, and this will be fused with and indistinguishable from the astronomical P; it will also give rise to a tide with speed γ, which will be indistinguishable from the astronomical part of K_1. Similarly the astronomical tide K_2 may be perturbed by a semi-annual inequality in the semi-diurnal astronomical tide of speed $2(\gamma-\eta)$. Although the diurnal tide S_1 or $\gamma-\eta$ and the semi-annual and annual tides of speeds 2η and η are all quite insensible as arising from astronomical causes, yet they have been found of sufficient importance to be considered. The annual and semi-annual tides are of enormous importance in some rivers, representing in fact the yearly flooding in the rainy season. In the reduction of these tides the arguments of the S series are t, $2t$, $3t$, &c., and of the annual, semi-annual, ter-annual tides h, $2h$, $3h$. As far as can be foreseen, the magnitudes of these tides are constant from year to year.

Meteorological Tides.

§ 27. *On the Form of Presentation of Results of Tidal Observations.*—Supposing n to be the speed of any tide in degrees per mean solar hour, and t to be mean solar time elapsing since 0^h of the first day of (say) a year of continuous observation, then the immediate result of harmonic analysis is to obtain a height R and an angle ζ such that the height of this tide at the time t is given by

Immediate Result of Harmonic Analysis.

$$R\cos(nt-\zeta).$$

R is the semi-range of the tide (say) in British feet, and ζ is an angle such that ζ/n is the time elapsing after 0^h of the first day until it is high water of this particular tide. It is obvious that ζ may have any value from 0° to 360°, and that the results of the analysis of successive years of observation will not be comparable with one another when presented in this form.

But let us suppose that the results of the analysis are presented in a number of terms of the form

$$fH\cos(V+u-\kappa),$$

where V is a linear function of the moon's and sun's mean longitudes, the mean longitude of the moon's and sun's perigees, and the local mean solar time at the place of observation, reduced to angle at 15° per hour. V increases uniformly with the time, and its rate of increase per mean solar hour is the n of the first method, and is called the speed of the tide. It is supposed that u stands for a certain function of the longitude of the node of the lunar orbit at an epoch half a year later than 0^h of the first day. Strictly speaking, u should be taken as the same function of the longitude of the moon's node, varying as the node moves; but, as the variation is but small in the course of a year, u may be treated as a constant and put equal to an average value for the year, which average value is taken as the true value of u at exactly mid year. Together $V+u$ constitute that function which has been tabulated as the "argument" in the schedules of § 25. Since $V+u$ are together the whole argument according to the equilibrium theory of tides, with sea covering the whole earth, it follows that κ/n is the lagging of the tide which arises from kinetic action, friction of the water, imperfect elasticity of the earth, and the distribution of land. It is supposed that H is the mean value in British feet of the semi-range of the particular tide in question; f is a numerical factor of augmentation or diminution, due to the variability of the obliquity of the lunar orbit. The value of f is the ratio of the "coefficient" in the third column of the preceding schedules to the mean value of the same term. It is obvious, then, that, if the tidal observations are consistent from year to year, H and κ should come out the same from each year's reductions. It is only when the results are presented in such a form as this that it will be possible to judge whether the harmonic analysis is yielding satisfactory results. This mode of giving the tidal results is also essential for the use of a tide-predicting machine (see § 8).

Final Form; Tidal Constants.

We must now show how to determine H and κ from R and ζ. It is clear that $H=R/f$, and the determination of f from the schedules depends on the evaluation of the mean value of each of the terms in the schedules, into which we shall not enter. If V_0 be the value of V at 0^h of the first day when t is zero, then clearly

$$-\zeta=V_0+u-\kappa,$$

so that

$$\kappa=\zeta+V_0+u.$$

Thus the rule for the determination of κ is: *Add to the value of ζ the value of the argument at 0^h of the first day.*

The results of harmonic analysis are usually tabulated by giving H, κ under the initial letter of each tide; the results are thus comparable from year to year.[1] For the purpose of using the tide-predicting machine the process of determining H and κ from R and ζ has simply to be reversed, with the difference that the instant of time to which to refer the argument is 0^h of the first day of the new year, and we must take note of the different values of u and f for the new year. Tables[2] have been computed for f and u for all longitudes of the moon's node and for each kind of tide, and the mean longitudes of moon, sun, and lunar perigee may be extracted from any ephemeris. Thus when the mean semi-range H and the retardation κ of any tide are known its height may be computed for any instant. The sum of the heights for all the principal tides of course gives the actual height of water.

Tidal Constants.

§ 28. *Numerical Harmonic Analysis.*—The tide-gauge furnishes us with a continuous graphical record of the height of the water above some known datum mark for every instant of time. The first operation performed on the tidal record is the measurement in feet and decimals of the height of water above the datum at every mean solar hour. The period chosen for analysis is about one year and the first measurement corresponds to noon.

Treatment of Tide Curves.

If T be the period of any one of the diurnal tides, or the double period of any one of the semi-diurnal tides, it approximates more or less nearly to 24 solar hours, and, if we divide it into 24 equal parts, we may speak of each as a T-hour.

The process of harmonic analysis consists of finding the average height of water at each of the 24 T-hours of the T-day, but we shall not go into the way in which this may be done.[3] It must suffice to say that it depends on the fact that in the long run any given T-hour will fall at all hours of any other special day.

The final outcome is that we obtain the height of water at each of the 24 T-hours of a T-day, freed from the influence of all the other tides. We may see that it is thus possible to isolate the T-tide. When this has been done let t denote T-time expressed in T-hours, and let n be 15°. Then we express the height h as given by the averaging process above indicated by the formula

$$h=A_0+A_1\cos nt+B_1\sin nt+A_2\cos 2nt+B_2\sin 2nt+\ldots,$$

where t is 0, 1, 2, . . . 23.

See the article Harmonic Analysis for the numerical processes by which A_0, A_1, B_1, A_2, B_2, &c., may be evaluated. It is obvious that such a formula as $A\cos nt+B\sin nt$ may easily be reduced to the form $R\cos(nt-\zeta)$. An actual numerical example of harmonic analysis of tidal observations is given in the *Admiralty Scientific Manual* (1886) in the article "Tides," or G. H. Darwin's *Scientific Papers*, vol. i.

V.—Synthetic Method

§ 29. *On the Method and Notation.*—The general nature of the synthetic method has been already explained; we now propose to show how the expressions for the tide may be developed from the result as expressed in the harmonic notation. If it should be desired to make a comparison of the results of tidal observation as expressed in the synthetic method with those of the harmonic method, or the converse, or to compute a tide-table from the harmonic constants by reference to the moon's transits and the declinations and parallaxes of sun and moon, analytical expressions founded on a procedure indicated in the following sections are necessary.

In chapter iv. the mean semi-range and angle of retardation of any one of the tides have been denoted by H and κ. We shall here, however, require to introduce several of the H's and κ's into the same expression, and they must therefore be distinguished from one another. This may in general be done conveniently by writing as a subscript letter the initial of the corresponding tide; for example H_m, κ_m will be taken to denote the H and κ of the lunar tide M_2. This notation does not suit the K_2 and K_1 tides,

[1] See, for example, a collection of results by Baird and Darwin, *Proc. Roy. Soc.* (1885), No. 239, and a more extensive one in Harris's *Manual*.

[2] *Report on Harmonic Analysis to Brit. Assoc.* (1883), and more extended table in Baird's *Manual of Tidal Observation* (London, 1887).

[3] See Darwin's *Tides* for an account without mathematics.

and we shall therefore write H'', κ'' for the semi-diurnal K_2, and H', κ' for the diurnal K_1 tide. These two tides proceed according to sidereal time and arise from the sun and moon jointly, and a synthesis of the two parts of each is effected in the harmonic method, although that synthesis is not explained in chapter iv. It is now necessary to reverse this partial synthesis, in order to obtain a more complete one. We must therefore note that the ratio of the solar to the lunar part of the total K_2 tide is 0·46407; so that 0·683 H'' is the lunar portion of the total K_2. There will be no occasion to separate the two portions of K_1, and we shall retain the synthesis which is effected in the harmonic method.

§ 30. *Semi-Diurnal Tides.*—The process adopted is to replace the mean longitudes and elements of the orbit in each term of the harmonic development of the schedules of § 25 by hour-angles, declinations, and parallaxes.

Mean Longitude and Elements Replaced by Hour-angle, Declination and Parallax.

At the time t (mean solar time of port reduced to angle) let α, δ, ψ be ☽'s R.A., declination, and hour-angle, and l ☽'s longitude measured from the "intersection." These and other symbols when written with a subscript accent are to apply to the sun. Then ν being the R.A. of the intersection, we have from the right-angled spherical triangle of which the sides are l, δ, $\alpha-\nu$ the relations

$$\tan(\alpha-\nu)=\cos I\tan l,\quad \sin\delta=\sin I\sin l. \tag{49}$$

Now $s-\xi$ is the ☽'s mean longitude measured from the intersection and $s-p$ is the mean anomaly; hence approximately

$$l=s-\xi+2e\sin(s-p). \tag{50}$$

From (49) and (50) we have approximately

$$\alpha=s+(\nu-\xi)+2e\sin(s-p)-\tan^2\tfrac{1}{2}I\sin 2(s-\xi).$$

Now, h being the ☉'s mean longitude, $t+h$ is the sidereal hour-angle, and $\psi=t+h-\alpha$.

Hence

$$t+h-s-(\nu-\xi)=\psi+2e\sin(s-p)-\tan^2\tfrac{1}{2}I\sin 2(s-\xi). \tag{51}$$

Again, if we put

$$\cos^2\Delta=1-\tfrac{1}{2}\sin^2 I \tag{52}$$

we have approximately from (49) and (50)

$$\left.\begin{aligned}\frac{\cos^2\delta-\cos^2\Delta}{\sin^2\Delta}&=\cos 2(s-\xi)\\ \text{whence}\quad \frac{\sin\delta\cos\delta}{\sigma\sin^2\Delta}\frac{d\delta}{dt}&=\sin 2(s-\xi)\end{aligned}\right\}. \tag{53}$$

Obviously Δ is such a declination that $\sin^2\Delta$ is the mean value of $\sin^2\delta$ during a lunar month. Again, if P be the ratio of the ☽'s parallax to her mean parallax, the equation to the ellipse described

$$\left.\begin{aligned}\text{gives}\quad \frac{1}{e}(P-1)&=\cos(s-p)\\ \text{whence}\quad -\frac{1}{e(\sigma-\varpi)}\frac{dP}{dt}&=\sin(s-p)\end{aligned}\right\}. \tag{54}$$

Now it appears in schedule A of § 25 that the arguments of all the lunar semi-diurnal tides are of the form $2(t+h-\nu)\pm 2(s-\xi)$ or $\pm(s-p)$. It is clear, therefore, that the cosines of such angles may by the relations (51), (53), (54) be expressed in terms of hour-angles, declinations and parallaxes. Also by means of (52) we may introduce Δ in place of I in the coefficients of each term. An approximate formula for Δ is $16·51°+3·44°\cos N-0·19°\cos 2N$. Details will be found in the *Brit. Assoc. Report* for 1885.

We shall not follow the analytical processes in detail, but the formulae given show the possibility of replacing the symbols used in the method of harmonic analysis by others involving R.A., declination and parallax.

Before giving the results of the processes indicated it must be remarked that greater succinctness is obtained by the introduction of the symbol δ' to denote the ☽'s declination at a time earlier than that of observation by an interval which may be called the "age of the declinational inequality," and is computed from the formula $\tan(\kappa''-\kappa_m)/2\sigma$ or $52·2^h\tan(\kappa''-\kappa_m)$. Similarly, it is convenient to introduce P' to denote the value of P at a time earlier than that of observation by the "age of the parallactic inequality," to be computed from $\tan(\kappa_m-\kappa_n)/(\sigma-\varpi)$ or $105·3^h\tan(\kappa_m-\kappa_n)$. These two "ages" probably do not differ in general much from a third period, computed from $(\kappa_s-\kappa_m)/2(\sigma-\eta)$, which is called the "age of the tide."

Age of Declinational Parallactic and Corrections.

The similar series of transformations when applied to the solar tides lead to simpler results, because $\Delta_{,}$ is a constant, being 16·33°, and the "ages" may be treated as zero; besides the terms depending on $d\delta_{,}/dt$ and $dP_{,}/dt$ are negligible. Formulae for the semi-diurnal tide of great exactness are obtainable by means of these transformations, but they lack the simplicity of those obtained in the harmonic method. On the other hand they are in some respects even more exact, since all lunar inequalities are represented. We shall not give the complex formulae which represent the complete substitution of R.A., declination and parallax in the earlier formulae, but shall content ourselves with rougher results, which are still fairly accurate.

Let us write them

$$\left.\begin{aligned}M&=P'^3\frac{\cos^2\nabla}{\cos^2\Delta_{,}}H_m+\frac{\cos^2\delta'-\cos^2\Delta}{\sin^2\Delta_{,}}0·683\,H''\cos(\kappa''-\kappa_m),\\ 2\mu&=\kappa_m+\frac{\cos^2\delta'-\cos^2\Delta}{\sin^2\Delta_{,}}0·683\frac{H''}{H_m}\sin(\kappa''-\kappa_m),\\ M_{,}&=P_{,}^3\frac{\cos^2\delta_{,}}{\cos^2\Delta_{,}}H_s,\\ 2\mu_{,}&=\kappa_s.\end{aligned}\right\} \tag{55}$$

Then we find that the height h_2 of the complete lunar and solar semi-diurnal tide is represented with a fair degree of approximation by

$$h_2=M\cos 2(\psi-\mu)+M_{,}\cos 2(\psi_{,}-\mu_{,}). \tag{56}$$

The first of these is the lunar tide, and it will be observed that the height M depends on the cube of the moon's parallax at a time earlier than that of observation by "the age of the parallactic inequality," and that it depends also on the moon's declination at a time earlier by "the age of the declinational inequality." The phase of the tide, represented by the angle 2μ, also has a declinational inequality.

Synthesis giving one Lunar and one Solar Tide.

The second term is the solar tide, and it also has parallactic and declinational inequalities.

The formulae (55), (56) have been used in an example of the computation of a tide-table given in the *Admiralty Scientific Manual* (1886).

§ 31. *Synthesis of Lunar and Solar Semi-Diurnal Tides.*—Let A be the excess of ☽'s over ☉'s R.A., so that

$$\left.\begin{aligned}A&=\alpha-\alpha_{,},\\ \psi_{,}&=\psi+A,\\ \text{and}\quad h_2&=M\cos 2(\psi-\mu)+M_{,}\cos 2(\psi+A-\mu_{,}).\end{aligned}\right\} \tag{57}$$

The synthesis is then completed by writing

$$\begin{aligned}H\cos 2(\mu-\phi)&=M+M_{,}\cos 2(A-\mu_{,}+\mu),\\ H\sin 2(\mu-\phi)&=\phantom{M+{}}M_{,}\sin 2(A-\mu_{,}+\mu),\\ \text{so that}\quad h_2&=H\cos 2(\psi-\phi).\end{aligned} \tag{58}$$

Then H is the height of the total semi-diurnal tide and $\phi/(\gamma-d\alpha/dt)$ or approximately $\phi/(\gamma-\sigma)$ or $\frac{2}{29}\phi$, when ϕ is given in degrees, is the "interval" from the moon's transit to high water.

Synthesis to obtain Single Term.

The formulae for H and ϕ may be written

$$\left.\begin{aligned}H&=\sqrt{\{M^2+M_{,}^2+2MM_{,}\cos 2(A-\mu_{,}+\mu)\}}\\ \tan 2(\mu-\phi)&=\frac{M_{,}\sin 2(A-\mu_{,}+\mu)}{M+M_{,}\cos 2(A-\mu_{,}+\mu)}.\end{aligned}\right\} \tag{59}$$

Since A goes through its period in a lunation, it follows that H and ϕ have inequalities with a period of half a lunation. These are called the "fortnightly inequalities in the height and interval.

Fortnightly Inequality.

Spring tide obviously occurs when $A=\mu_{,}-\mu$. Since the mean value of A is $s-h$ (the difference of the mean longitudes), and since the mean values of μ and $\mu_{,}$ are $\frac{1}{2}\kappa_m$, $\frac{1}{2}\kappa_s$, it follows that the mean value of the period elapsing after full moon and change of moon up to spring tide is $(\kappa_s-\kappa_m)/2(\sigma-\eta)$. The association of spring tide with full and change is obvious, and a fiction has been adopted by which it is held that spring tide is generated in those configurations of the moon and sun, but takes some time to reach the port of observation. Accordingly $(\kappa_s-\kappa_m)/2(\sigma-\eta)$ has been called the "age of the tide." The average age is about 36 hours as far as observations have yet been made. The age of the tide appears not in general to differ very much from the ages of the declinational and parallactic inequalities.

Age of Tide.

In computing a tide-table it is found practically convenient not to use A, which is the difference of R.A.'s at the unknown time of high-water, but to refer the tide to A_0, the difference of R.A.'s at the time of the moon's transit. It is clear that A_0 is the apparent time of the moon's transit reduced to angle at 15° per hour. We have already remarked that $\phi/(\gamma-d\alpha/dt)$ is the interval from transit to high-water, and hence at high-water

$$A=A_0+\frac{d\alpha/dt-d\alpha_{,}/dt}{\gamma-d\alpha_{,}/dt}\phi. \tag{60}$$

As an approximation we may attribute to all the quantities in the second term their mean values, and we then have

Reference to Moon's Transit.

$$A=A_0+\frac{\sigma-\eta}{\gamma-\sigma}\mu$$

$$\text{and}\quad A-\mu_{,}+\mu=A_0-\mu_{,}+\frac{\gamma-\eta}{\gamma-\sigma}\mu=A_0-\mu_{,}+\tfrac{30}{29}\mu. \tag{61}$$

This approximate formula (61) may be used in computing from (59) the fortnightly inequality in the "height" and "interval."

In this investigation we have supposed that the declinational and parallactic corrections are applied to the lunar and solar tides before their synthesis; but it is obvious that the process may be reversed, and that we may form a table of the fortnightly inequality based on mean values H_m and H_s and afterwards apply corrections. This is the process usually adopted, but it is less exact. The labour of computing the fortnightly inequality, especially by graphical methods, is not great, and the plan here suggested seems preferable.

§ 32. *Diurnal Tides.*—These tides have not been usually treated with much completeness in the synthetic method. In the tide-tables of the British Admiralty we find that the tides at some ports are "affected by diurnal inequality"; such a statement may be interpreted as meaning that the tides are not to be predicted by the information given in the so-called tide-table. The diurnal tides are indeed complex, and do not lend themselves easily to a complete synthesis. In the harmonic notation the three important tides are K_1, O, P, and the lunar portion of K_1 is nearly equal to O in height, whilst the solar portion is nearly equal to P. A complete synthesis may be carried out on the lines adopted in treating the semi-diurnal tides, but the advantage of the plan is lost in consequence of large oscillations of the amplitude through the value zero, so that the tide is often represented by a negative quantity multiplied by a circular function. It is best, then, only to attempt a partial synthesis, and to admit the existence of two diurnal tides. One of these will be a tide consisting of K_1 and P united, and the other will be O.

We shall not give the requisite formulae, but refer the reader to the *Brit. Assoc. Report* for 1885. A numerical example is given in the *Admiralty Manual* for 1886.

§ 33. *On the Reduction of Observations of High- and Low-Water.*[1]—A continuous register of the tide or observation at fixed intervals of time, such as each hour, is certainly the best; but for the adequate use of such a record some plan analogous to harmonic analysis is necessary. Observations of high- and low-water only have, at least until recently, been more usual. In the reduction the immediate object is to connect the times and heights of high- and low-water with the moon's transits by means of the establishment, age and fortnightly inequality in the interval and height. The reference of the tide to the establishment is not, however, scientifically desirable, and it is better to determine the mean establishment, which is the mean interval from the moon's transit to high-water at spring tide, and the age of the tide, which is the mean period from full moon and change of moon to spring tide.

Graphical Determination of Establishment, &c.

For these purposes the observations may be conveniently treated graphically.[2] An equally divided horizontal scale is taken to represent the twelve hours of the clock of civil time, regulated to the time of the port, or—more accurately—arranged always to show apparent time by being fast or slow by the equation of time; this time-scale represents the time-of-clock of the moon's transit, either upper or lower. The scale is perhaps most conveniently arranged in the order V, VI,...XII, I...IIII. Then each interval of time from transit to high-water is set off as an ordinate above the corresponding time-of-clock of the moon's transit. A sweeping curve is drawn nearly through the tops of the ordinates, so as to cut off minor irregularities. Next along the same ordinates are set off lengths corresponding to the height of water at each high-water. A second similar figure may be made for the interval and height at low-water. In the curve of high-water intervals the ordinate corresponding to XII. is the establishment, since it gives the time of high-water at full moon and change of moon. That ordinate of high-water intervals which is coincident with the greatest ordinate of high-water heights gives the mean establishment. Since the moon's transit falls about fifty minutes later on each day, in setting off a fortnight's observations there will be about five days for each four times-of-clock of the upper transit. Hence in these figures we may regard each division of the time-scale I to II, II to III, &c., as representing twenty-five hours instead of one hour. Then the distance from the greatest ordinate of high-water heights to XII is called the age of the tide. From these two figures the times and heights of high- and low-water may in general be predicted with fair approximation. We find the time-of-clock of the moon's upper or lower transit on the day, correct by the equation of time, read off the corresponding heights of high- and low-water from the figures, and the intervals being also read off are added to the time of the moon's transit and give the times of high- and low-water. At all ports there is, however, an irregularity of heights and intervals between successive tides, and in consequence of this the curves present more or less of a zigzag appearance. Where the zigzag is perceptible to the eye, the curves must be smoothed by drawing them so as to bisect the zigzags, because these diurnal inequalities will not present themselves similarly in the future. When, as in some equatorial ports, the diurnal tides are large, this method of tidal prediction fails in the simple form explained above. It may however be rendered applicable by greater elaboration.[3]

This method of working out observations of high- and low-water was not the earliest. In the *Mécanique Céleste*, bks. i. and v., Laplace treats a large mass of tidal observations by dividing them into classes depending on the configurations of the tide-generating bodies. Thus he separates the two syzygial tides at full moon and change of moon and divides them into equinoctial and solstitial tides. He takes into consideration the tides of several days embracing these configurations. He goes through the tides at quadratures on the same general plan. The effects of declination and parallax and the diurnal inequalities are similarly treated. Lubbock (*Phil. Trans.*, 1831, seq.) improved the method of Laplace by taking into account all the observed tides, and not merely those appertaining to certain configurations. He divided the observations into a number of classes. First, the tides are separated into parcels, one for each month; then each parcel is sorted according to the hour of the moon's transit. Another classification is made according to declination; another according to parallax; and a last for the diurnal inequalities. This plan was followed in treating the tides of London, Brest, St Helena, Plymouth, Portsmouth and Sheerness. Whewell (*Phil. Trans.*, 1834, seq.) did much to reduce Lubbock's results to a mathematical form, and made a highly important advance by the introduction of graphical methods by means of curves. The method explained above is due to him. Airy remarks of Whewell's papers that they appear to be "the best specimens of reduction of new observations that we have ever seen."

Methods of Laplace, Lubbock, Whewell.

VI.—Tidal Deformation of the Solid Earth

§ 34. *Elastic Tides.*—The tide-generating potential varies as the square of the distance from the earth's centre, and the corresponding forces act at every point throughout its mass. No solid matter possesses the property of absolute rigidity, and we must therefore admit the probable existence of tidal elastic deformation of the solid earth. The problem of finding the state of strain of an elastic sphere under given stresses was first solved by G. Lamé;[4] he made, however, but few physical deductions from his solution. An independent solution was found by Lord Kelvin,[5] who drew some interesting conclusions concerning the earth.

Elastic Tides.

His problem, in as far as it is now material, is as follows. Let a sphere of radius a and density w be made of elastic material whose bulk and rigidity moduli are k and n, and let it be subjected to forces due to a potential per unit volume, equal to $\tau w r^2(\sin^2\lambda - \frac{1}{3})$, where λ is latitude. Then it is required to find the strain of the sphere. We refer the reader to the original sources for the methods of solution applicable to spherical shells and to solid spheres. The investigation applies either to tidal or to rotational stresses. In the case of tides $\tau = \frac{3}{2}m/c^3$, m and c being the moon's mass and distance, and in the case of rotation $\tau = -\frac{1}{2}\omega^2$, ω being the angular velocity about the polar axis. The equation to the surface is found to be

$$r = a\left\{1 + \frac{15wa^2}{19n}\left[1 + \frac{\frac{6}{95}\,n/k}{1+\frac{4}{57}n/k}\right]\tau(\sin^2\lambda - \tfrac{1}{3})\right\}.$$

In most solids the bulk modulus is considerably larger than the rididity modulus, and in this discussion it is sufficient to neglect n compared with k. With this approximation, the ellipticity e of the surface becomes

$$e = \frac{5wa^2}{19n}\tau.$$

Now suppose the sphere to be endued with the power of gravitation, and write

$$\mathfrak{r} = \frac{19n}{5wa^2}, \qquad \mathfrak{g} = \frac{2}{5}\frac{g}{a},$$

where g is gravity at the surface of the globe. Then, if there were no elasticity, the ellipticity would be given by $e = \tau/\mathfrak{g}$, and without gravitation by $e = \tau/\mathfrak{r}$. And it may be proved in several ways that, gravity and elasticity co-operating,

$$e = \frac{\tau}{\mathfrak{r} + \mathfrak{g}} = \frac{\tau}{\mathfrak{g}} \cdot \frac{1}{1 + \mathfrak{r}/\mathfrak{g}}.$$

If n be the rigidity of steel, and if the globe have the size and mean density of the earth, $\mathfrak{r}/\mathfrak{g} = 2$, and with the rigidity of glass $\mathfrak{r}/\mathfrak{g} = \frac{2}{3}$. Hence the ellipticity of an earth of steel under tide-generating force would be $\frac{1}{3}$ of that of a fluid earth, and the fraction for glass would be $\frac{3}{5}$. If an ocean be superposed on the globe, the visible tide will be the excess of the fluid tide above the solid tide. Hence for steel the oceanic tides would be reduced to $\frac{2}{3}$, and for glass to $\frac{2}{5}$ of the tides on a rigid earth.

It is not possible in general to compute the tides of an ocean lying on an unyielding nucleus. But Laplace argued that friction would cause the tides of long period (§ 17) to conform to the equilibrium law, and thus be amenable to calculation. Acting on this belief, G. H. Darwin discussed the tides of long period as observed during 33 years at various ports, and found them to be $\frac{2}{3}$ as great as on an unyielding globe, indicating an elasticity equal to that of steel.[6] Subsequently W. Schweydar repeated the calculation from 194 years of observation with nearly the same result.[7] But as Laplace's argument appears to be unsound (§ 17), the conclusion seems to become of doubtful validity. Yet subsequently Lord Rayleigh showed

that the existence in the ocean of continental barriers would have the same effect as that attributed by Laplace to friction, and thus he re-established the soundness of the result.[1]

A wholly independent estimate derived from what is called the variation of latitude also leads to the same conclusion, namely that the earth is about as stiff as steel.[2]

The theory of the tides of an elastic planet gives, *mutatis mutandis*, that of the tides of a viscous spheroid. The reader who desires to know more of this subject and to obtain references to original memoirs may refer to G. H. Darwin's *Tides*.

VII.—Tidal Friction

§ 35. *Investigation of the Secular Effects of Tidal Friction.*—We have indicated in general terms in § 9 that the theory of tidal friction leads to an interesting speculation as to the origin of the moon. We shall therefore investigate the theory mathematically in the case where a planet is attended by a single satellite moving in a circular orbit, and rotates about an axis perpendicular to that orbit. In order, however, to abridge the investigation we shall only consider the case where the planetary rotation is more rapid than the satellite's orbital motion.

Suppose an attractive particle or satellite of mass m to be moving in a circular orbit, with an angular velocity ω, round a planet of mass M and suppose the planet to be rotating about an axis perpendicular to the plane of the orbit, with an angular velocity n; suppose, also, the mass of the planet to be partially or wholly imperfectly elastic or viscous, or that there are oceans on the surface of the planet; then the attraction of the satellite must produce a relative motion in the parts of the planet, and that motion must be subject to friction, or, in other words, there must be frictional tides of some sort or other. The system must accordingly be losing energy by friction, and its configuration must change in such a way that its whole energy diminishes. Such a system does not differ much from those of actual planets and satellites, and, therefore, the results deduced in this hypothetical case must agree pretty closely with the actual course of evolution, provided that time enough has been and will be given for such changes. Let C be the moment of inertia of the planet about its axis of rotation, r the distance of the satellite from the centre of the planet, h the resultant moment of momentum of the whole system, e the whole energy, both kinetic and potential, of the system. It is assumed that the figure of the planet and the distribution of its internal density are such that the attraction of the satellite causes no couple about any axis perpendicular to that of rotation. A special system of units of mass, length and time will now be adopted such that the analytical results may be reduced to their simplest forms. Let the unit of mass be $Mm/(M+m)$. Let the unit of length γ be such a distance that the moment of inertia of the planet about its axis of rotation may be equal to the moment of inertia of the planet and satellite, treated as particles, about their centre of inertia, when distant γ apart from one another. This condition gives

Energy Diminished by Friction.

$$M\left(\frac{m\gamma}{M+m}\right)^2 + m\left(\frac{M\gamma}{M+m}\right)^2 = C;$$

Let the unit of time τ be the time in which the satellite revolves through 57·3° about the planet, when the satellite's radius vector is equal to γ. This system of units will be found to make the three following functions each equal to unity, viz. $\mu^{\frac{1}{2}}Mm(M+m)^{-\frac{1}{2}}$, μMm, and C, where μ is the attractional constant. The units are in fact derived from the consideration that these functions shall each be unity. In the case of the earth and moon, if we take the moon's mass as $\frac{1}{82}$ of the earth's and the earth's moment of inertia as $\frac{1}{3}Ma^2$ (as is very nearly the case), it may easily be shown that the unit of mass is $\frac{1}{83}$ of the earth's mass, the unit of length 5·26 earth's radii or 33,506 kilometres (20,807 miles), and the unit of time 2 hrs. 41 mins. In these units the present angular velocity of the earth's diurnal rotation is expressed by 0·7044, and the moon's present radius vector by 11·454. The two bodies being supposed to revolve in circles about their common centre of inertia with an angular velocity ω, the moment of momentum of orbital motion is

Special Units.

Moment of Momentum.

$$M\left(\frac{mr}{M+m}\right)^2\omega + M\left(\frac{Mr}{M+m}\right)^2\omega = \frac{Mm}{M+m}r^2\omega.$$

Then, by the law of periodic times in a circular orbit,

$$\omega^2 r^3 = \mu(M+m);$$

whence $$\omega r^2 = \mu^{\frac{1}{2}}(M+m)^{\frac{1}{2}}r^{\frac{1}{2}}.$$

Thus the moment of momentum of orbital motion

$$=\mu^{\frac{1}{2}}Mm(M+m)^{-\frac{1}{2}}r^{\frac{1}{2}},$$

and in the special units this is equal to $r^{\frac{1}{2}}$. The moment of momentum of the planet's rotation is Cn, and $C=1$ in the special units. Therefore

$$h = n + r^{\frac{1}{2}}. \qquad (62)$$

Since the moon's present radius vector is 11·454, it follows that the orbital momentum of the moon is 3·384. Adding to this the rotational momentum of the earth, which is 0·704, we obtain 4·088 for the total moment of momentum of the moon and earth. The ratio of the orbital to the rotational momentum is 4·80, so that the total moment of momentum of the system would, but for the obliquity of the ecliptic, be 5·80 times that of the earth's rotation. Again, the kinetic energy of orbital motion is

$$\tfrac{1}{2}M\left(\frac{mr}{M+m}\right)^2\omega^2 + \tfrac{1}{2}m\left(\frac{Mr}{M+m}\right)^2\omega^2 = \tfrac{1}{2}\frac{Mm}{M+m}r^2\omega^2 = \tfrac{1}{2}\frac{\mu Mm}{r}.$$

The kinetic energy of the planet's rotation is $\frac{1}{2}Cn^2$. The potential energy of the system is $-\mu Mm/r$. Adding the three energies together, and transforming into the special units, we have

$$2e = n^2 - 1/r. \qquad (63)$$

Now let $\quad x = r^{\frac{1}{2}}, \quad y = n, \quad Y = 2e.$

It will be noticed that x, the moment of momentum of orbital motion is equal to the square root of the satellite's distance from the planet. Then equations (62) and (63) become

$$h = y + x \qquad (64)$$

$$Y = y^2 - 1/x^2 = (h-x)^2 - 1/x^2 \qquad (65)$$

(64) is the equation of conservation of moment of momentum, or, shortly, the equation of momentum; (65) is the equation of energy.

Now consider a system started with given positive moment of momentum h; and we have all sorts of ways in which it may be started. If the two rotations be of opposite kinds, it is clear that we may start the system with any amount of energy, however great, but the true maxima and minima of energy compatible with the given moment of momentum are supplied by $dY/dx=0$,

Maximum and Minimum Energy.

or $\quad x - h + 1/x^3 = 0,$

that is to say, $$x^4 - hx^3 + 1 = 0. \qquad (66)$$

We shall presently see that this quartic has either two real roots and two imaginary, or all imaginary roots. The quartic may be derived from quite a different consideration, viz. by finding the condition under which the satellite may move round the planet so that the planet shall always show the same face to the satellite—in fact, so that they move as parts of one rigid body. The condition is simply that the satellite's orbital angular velocity $\omega = n$, the planet's angular velocity of rotation, or $y = 1/x^3$, since $n = y$ and $r^{\frac{1}{2}} = \omega^{-\frac{1}{3}} = x$. By substituting this value of y in the equation of momentum (64), we get as before

No Relative Motion between Satellite and Planet when Energy Maximum or Minimum.

$$x^4 - hx^3 + 1 = 0.$$

At present we have only obtained one result, viz. that, if with given moment of momentum it is possible to set the satellite and planet moving as a rigid body, it is possible to do so in two ways, and one of these ways requires a maximum amount of energy and the other a minimum; from this it is clear that one must be a rapid rotation with the satellite near the planet and the other a slow one with the satellite remote from the planet. Of the three equations

$$h = y + x, \qquad (67)$$

$$Y = (h-x)^2 - 1/x^2, \qquad (68)$$

$$x^3 y = 1, \qquad (69)$$

(67) is the equation of momentum, (68) that of energy, and (69) may be called the equation of rigidity, since it indicates that the two bodies move as though parts of one rigid body.

Equations of Momentum, Energy, and no Relative Motion.

To illustrate these equations geometrically, we may take as abscissa x, which is the moment of momentum of orbital motion, so that the axis of x may be called the axis of orbital momentum. Also, for equations (67) and (69) we may take as ordinate y, which is the moment of momentum of the planet's rotation, so that the axis of y may be called the axis of rotational momentum. For (68) we may take as ordinate Y, which is twice the energy of the system, so that the axis of Y may be called the axis of energy. Then, as it will be convenient to exhibit all three curves in the same figure, with a parallel axis of x, we must have the axis of energy identical with that of rotational momentum. It will not be necessary to consider the case where the resultant moment of momentum h is negative, because this would only be equivalent to reversing all the rotations; h is therefore to be taken as essentially positive. The line of momentum whose equation is (67) is a straight line inclined at 45° to either axis, having positive intercepts on both axes. The curve of rigidity whose equation is (69) is clearly of the same nature as a rectangular hyperbola, but it has a much more rapid rate of approach to the axis of orbital momentum than to that of rotational momentum. The intersections (if any) of the curve of rigidity with the line of momentum have abscissae which are the two roots of the quartic $x^4 - hx^3 + 1 = 0$. The quartic has, therefore, two real roots or all imaginary roots. Then, since $x = r^{\frac{1}{2}}$, the intersection which is more remote from the origin indicates a configuration where the satellite is remote from the planet; the other gives the configuration where the satellite is closer to the planet. We have already learnt that these two correspond respectively to minimum and maximum energy. When x is very large the equation to the curve of energy is $Y = (h-x)^2$, which is the equation to a parabola with a vertical axis parallel to Y and distant h from the origin, so that the axis of the parabola passes through the intersection of the line of momentum

[1] *Phil. Mag.* (1903), v. 136.
[2] Hough, *Phil. Trans.* (1897), 187 A, p. 319.

with the axis of orbital momentum. When x is very small, the equation becomes $Y=-1/x^2$. Hence the axis of Y is asymptotic on both sides to the curve of energy. If the line of momentum intersects the curve of rigidity, the curve of energy has a maximum vertically underneath the point of intersection nearer the origin and a minimum underneath the point more remote. But if there are no intersections, it has no maximum or minimum.

Fig. 8 shows these curves when drawn to scale for the case of the earth and moon, that is to say, with $h=4$. The points a and b, which are the maximum and minimum of the curve of energy, are supposed to be on the same ordinates as A and B, the intersections of the curve of rigidity with the line of momentum. The intersection of the line of momentum with the axis of orbital momentum is

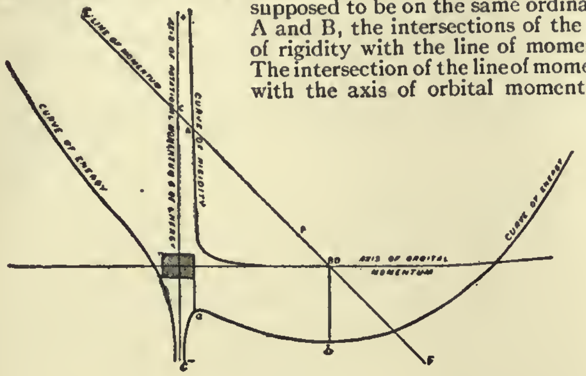

FIG. 8.

denoted by D, but in a figure of this size it necessarily remains indistinguishable from B. As the zero of energy is quite arbitrary the origin for the energy curve is displaced downwards, and this prevents the two curves from crossing one another in a confusing manner. On account of the limitation imposed we neglect the case where the quartic has no real roots. Every point of the line of momentum gives by its abscissa and ordinate the square root of the satellite's distance and the rotation of the planet, and the ordinate of the energy curve gives the energy corresponding to each distance of the satellite. Part of the figure has no physical meaning, for it is impossible for the satellite to move round the planet at a distance less than the sum of the radii of the planet and satellite. For example, the moon's diameter being about 2200 m. and the earth's about 8000, the moon's distance cannot be less than 5100 miles. Accordingly a strip is marked off and shaded on each side of the vertical axis within which the figure has no physical meaning. The point P indicates the present configuration of the earth and moon. The curve of rigidity $x^3y=1$ is the same for all values of h, and by moving the line of momentum parallel to itself nearer to or further from the origin, we may represent all possible moments of momentum of the whole system. The smallest amount of moment of momentum with which it is possible to set the system moving as a rigid body, with centrifugal force enough to balance the mutual attraction, is when the line of momentum touches the curve of rigidity. The condition for this is clearly that the equation $x^4-hx^3+1=0$ should have equal roots. If it has equal roots, each root must be $\frac{3}{4}h$, and therefore

Least Momentum for which no Relative Motion Possible.

$$(\tfrac{3}{4}h)^3-h(\tfrac{3}{4}h)^3+1=0,$$

whence $h^4=4^4/3^3$, or $h=4/3^{\frac{3}{4}}=1\cdot75$. The actual value of h for the moon and earth is about 4; hence, if the moon-earth system were started with less than $\frac{7}{16}$ of its actual moment of momentum, it would not be possible for the two bodies to move so that the earth should always show the same face to the moon. Again, if we travel along the line of momentum, there must be some point for which yx^3 is a maximum, and since $yx^3=n/\omega$ there must be some point for which the number of planetary rotations is greatest during one revolution of the satellite; or, shortly, there must be some configuration for which there is a maximum number of days in the month. Now yx^3 is equal to x^3 $(h-x)$, and this is a maximum when $x=\frac{3}{4}h$ and the maximum number of days in the month is $(\frac{3}{4}h)^3(h-\frac{3}{4}h)$ or $3^3h^4/4^4$; if h is equal to 4, as is nearly the case for the earth and moon, this becomes 27. Hence it follows that we now have very nearly the maximum number of days in the month. A more accurate investigation in a paper on the "Precession of a Viscous Spheroid" in *Phil. Trans.* (1879), pt. i., showed that, taking account of solar tidal friction and of the obliquity to the ecliptic, the maximum number of days is about 29, and that we have already passed through the phase of maximum.

Maximum Number of Days in Month.

We will now consider the physical meaning of the figure. It is assumed that the resultant moment of momentum of the whole system corresponds to a positive rotation. Now imagine two points with the same abscissa, one on the momentum line and the other on the energy curve, and suppose the one on the energy curve to guide that on the momentum line. Since we are supposing frictional tides to be raised on the planet, the energy must degrade, and however the two points are set initially the point on the energy curve must always slide down a slope, carrying with it the other point. Looking at the figure, we see that there are four slopes in the energy curve, two running down to the planet and two down to the minimum. There are therefore four ways in which the system may degrade, according to the way it was started; but we shall only consider one, that corresponding to the portion AB*ba* of the figure. For the part of the line of momentum AB the month is longer than the day, and this is the case with all known satellites except the nearer one of Mars. Now, if a satellite be placed in the condition A—that is to say, moving rapidly round a planet which always shows the same face to the satellite—the condition is clearly dynamically unstable, for the least disturbance will determine whether the system shall degrade down the slopes *ac* or *ab*—that is to say, whether it falls into or recedes from the planet. If the equilibrium breaks down by the satellite receding, the recession will go on until the system has reached the state corresponding to B. It is clear that, if the intersection of the edge of the shaded strip with the line of momentum be identical with the point A, which indicates that the satellite is just touching the planet, then the two bodies are in effect parts of a single body in an unstable configuration. If, therefore, the moon was originally part of the earth, we should expect to find this identity. Now in fig. 9, drawn to scale to represent the earth and moon, there is so close an approach between the edge of the shaded band and the intersection of the line of momentum and curve of rigidity that it would be scarcely possible to distinguish them. Hence, there seems a probability that the two bodies once formed parts of a single one, which broke up in consequence of some kind of instability. This view is confirmed by the more detailed consideration of the case in the paper on the "Precession of a Viscous Spheroid," already referred to, and subsequent papers, in the *Phil. Trans.*[1]

Discussion of Figure.

History of Satellite as Energy Degrades.

§ 36. *Effects of Tidal Friction on the Elements of the Moon's Orbit and on the Earth's Rotation.*—It would be impossible within the limits of the present article to discuss completely the effects of tidal friction; we therefore confine ourselves to certain general considerations which throw light on the nature of those effects. We have in the preceding section supposed that the planet's axis is perpendicular to the orbit of the satellite, and that the latter is circular; we shall now suppose the orbit to be oblique to the equator and eccentric. For the sake of brevity the planet will be called the earth, and the satellite the moon. The complete investigation was carried out on the hypothesis that the planet was a viscous spheroid, because this was the only theory of frictionally resisted tides which had been worked out. Although the results would be practically the same for any system of frictionally resisted tides, we shall speak below of the planet or earth as a viscous body.[2]

We shall show that if the tidal retardation be small the obliquity of the ecliptic increases, the earth's rotation is retarded, and the moon's distance and periodic time are increased. Fig. 9 represents the earth as seen from above the south pole, so that S is the pole and the outer circle the equator. The earth's rotation is in the direction of the curved arrow at S. The half of the inner circle which is drawn with a full line is a semi-small-circle of south latitude, and the dotted semicircle is a semi-small-circle in the same north latitude. Generally dotted lines indicate parts of the figure which are below the plane of the paper. If the moon were cut in two and one half retained at the place of the moon and the other half transported to a point diametrically opposite to the first half with reference to the earth, there would be no material change in the tide-generating forces. It is easy to verify this statement by reference to § 11. These two halves may be described as moon and anti-moon, and such a substitution will facilitate the explanation. Let M and M′ be the projections of the moon and anti-moon on to the terrestrial sphere. If the fluid in which the tides are raised were perfectly frictionless,[3] or if the earth were a perfect fluid or perfectly elastic, the apices of the tidal spheroid would be at M and M′. If, however, there is internal friction, due to any sort of viscosity, the tides will lag, and we may suppose the tidal apices to be at T and T′. Now suppose the tidal protuberances to be replaced by two equal heavy particles at T and T′, which are instantaneously rigidly connected with the earth. Then the attraction of the moon on T is greater

Obliquity of the Ecliptic Increases.

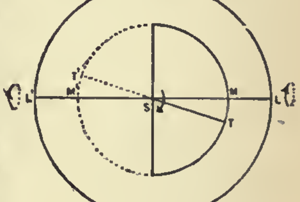

FIG. 9.

[1] For further consideration of this subject see a series of papers by G. H. Darwin in *Proceed.* and *Trans.* of the Royal Society from 1878 to 1881, and app. G. (*b*) t. pt. ii. vol. i. of Thomson and Tait's *Nat. Phil.* (1883); or *Scientific Papers*, vol. ii.

[2] These explanations, together with other remarks, are to be found in the abstracts of G. H. Darwin's memoirs in *Proc. Roy. Soc.*, 1878 to 1881.

[3] We here suppose the tides not to be inverted. If they are inverted the conclusion is precisely the same.

than on T′, and that of the anti-moon on T′ is greater than on T. The resultant of these forces is clearly a pair of forces acting on the earth in the direction TM, T′M′. These forces cause a couple about the axis in the equator, which lies in the same meridian as the moon and anti-moon. The direction of the couple is shown by the curved arrows at L,L′. If the effects of this couple be compounded with the existing rotation of the earth according to the principle of the gyroscope, the south pole S will tend to approach M and the north pole to approach M′. Hence, supposing the moon to move in the ecliptic, the inclination of the earth's axis to the ecliptic diminishes, or the obliquity increases. Next the forces TM, T′M′ clearly produce, as in the simpler case considered in § 9, a couple about the earth's polar axis, which tends to retard the diurnal rotation.

This general explanation remains a fair representation of the state of the case so long as the different harmonic constituents of the aggregate tide-wave do not suffer very different amounts of retardation; and this is the case so long as the viscosity is not great. The rigorous result for a viscous planet shows that in general the obliquity will increase, and it appears that, with small viscosity of the planet, if the period of the satellite be longer than two periods of rotation of the planet, the obliquity increases, and vice versâ. Hence, zero obliquity is only dynamically stable when the period of the satellite is less than two periods of the planet's rotation.

Inclination of Plane of Orbit Generally Decreases.

It is possible, by similar considerations, to obtain some insight into the effect which tidal friction must have on the plane of the lunar orbit, but as the subject is somewhat complex we shall not proceed to a detailed examination of the question. It must suffice to say that in general the inclination of the lunar orbit must diminish. Now let us consider a satellite revolving about a planet in an elliptic orbit, with a periodic time which is long compared with the period of rotation of the planet; and suppose that frictional tides are raised in the planet. The major axis of the tidal spheroid always points in advance of the satellite, and exercises on it a force which tends to accelerate its linear velocity. When the satellite is in perigee the tides are higher, and this disturbing force is greater than when the satellite is in apogee. The disturbing force may therefore be represented as a constant force, always tending to accelerate the motion of the satellite, to which is added a periodic force accelerating in perigee and retarding in apogee. The constant force causes a secular increase of the satellite's mean distance and a retardation of its mean motion. The accelerating force in perigee causes the satellite to swing out farther than it would otherwise have done, so that when it comes round to apogee it is more remote from the planet. The retarding force in apogee acts exactly inversely, and diminishes the perigean distance. Thus, the apogean distance increases and the perigean distance diminishes, or in other words, the eccentricity of the orbit increases. Now consider another case, and suppose the satellite's periodic time to be identical with that of the planet's rotation. Then, when the satellite is in perigee, its angular motion is faster than that of the planet's rotation, and when in apogee it is slower; hence at apogee the tides lag, and at perigee they are accelerated. Now the lagging apogean tides give rise to an accelerating force on the satellite, and increase the perigean distance, whilst the accelerated perigean tides give rise to a retarding force, and decrease the apogean distance. Hence in this case the eccentricity of the orbit will diminish. It follows from these two results that there must be some intermediate periodic time of the satellite for which the eccentricity does not tend to vary.

Eccentricity of Orbit Generally Increases.

But it May Decrease.

But the preceding general explanation is in reality somewhat less satisfactory than it seems, because it does not make clear the existence of certain antagonistic influences, to which, however, we shall not refer. The full investigation for a viscous planet shows that in general the eccentricity of the orbit will increase. When the viscosity is small the law of variation of eccentricity is very simple: if eleven periods of the satellite occupy a longer time than eighteen rotations of the planet, the eccentricity increases, and vice versâ. Hence in the case of small viscosity a circular orbit is only dynamically stable if the eleven periods are shorter than the eighteen rotations.

VIII.—Cosmogonic Speculations Founded on Tidal Friction

§ 37. *History of the Earth and Moon.*—We shall not attempt to discuss the mathematical methods by which the complete history of a planet, attended by one or more satellites, is to be traced. The laws indicated in the preceding sections show that there is such a problem, and that it may be solved, and we refer to G. H. Darwin's papers for details (*Phil. Trans.*, 1879–1881). It may be interesting, however, to give the various results of the investigation in the form of a sketch of the possible evolution of the earth and moon, followed by remarks on the other planetary systems and on the solar system as a whole.

We begin with a planet not very much more than 8000 m. in diameter, and probably partly solid, partly fluid, and partly gaseous. It is rotating about an axis inclined at about 11° or 12° to the normal to the ecliptic, with a period of from two to four hours, and is revolving about the sun with a period not much shorter than our present year. The rapidity of the planet's rotation causes so great a compression of its figure that it cannot continue to exist in an ellipsoidal form with stability; or else it is so nearly unstable that complete instability is induced by the solar tides. The planet then separates into two masses, the larger being the earth and the smaller the moon. It is not attempted to define the mode of separation, or to say whether the moon was initially a chain of meteorites. At any rate it must be assumed that the smaller mass became more or less conglomerated and finally fused into a spheroid, perhaps in consequence of impacts between its constituent meteorites, which were once part of the primeval planet. Up to this point the history is largely speculative, for the investigation of the conditions of instability in such a case surpasses the powers of the mathematician. We have now the earth and moon nearly in contact with one another, and rotating nearly as though they were parts of one rigid body. This is the system which was the subject of dynamical investigation. As the two masses are not rigid, the attraction of each distorts the other; and, if they do not move rigorously with the same periodic time, each raises a tide in the other. Also the sun raises tides in both. In consequence of the frictional resistance to these tidal motions, such a system is dynamically unstable. If the moon had moved orbitally a little faster than the earth rotated, she must have fallen back into the earth; thus the existence of the moon compels us to believe that the equilibrium broke down by the moon revolving orbitally a little slower than the earth rotates. In consequence of the tidal friction the periodic times both of the moon (or the month) and of the earth's rotation (or the day) increase; but the month increases in length at a much greater rate than the day. At some early stage in the history of the system the moon was conglomerated into a spheroidal form, and acquired a rotation about an axis nearly parallel to that of the earth.

Conjectural Genesis of Moon from Earth.

Earth and Moon Subject of Investigation.

The Moon.

The axial rotation of the moon is retarded by the attraction of the earth on the tides raised in the moon, and this retardation takes place at a far greater rate than the similar retardation of the earth's rotation. As soon as the moon rotates round her axis with twice the angular velocity with which she revolves in her orbit, the position of her axis of rotation (parallel with the earth's axis) becomes dynamically unstable. The obliquity of the lunar equator to the plane of the orbit increases, attains a maximum, and then diminishes. Meanwhile the lunar axial rotation is being reduced towards identity with the orbital motion. Finally, her equator is nearly coincident with the plane of the orbit, and the attraction of the earth on a tide, which degenerates into a permanent ellipticity of the lunar equator, causes her always to show the same face to the earth.

The Earth and Lunar Orbit.

All this must have taken place early in the history of the earth, to which we now return. At first the month is identical with the day, and as both these increase in length the lunar orbit will retain its circular form until the month is equal to $1\frac{7}{11}$ days. From that time the orbit begins to be eccentric, and the eccentricity increases thereafter up to its present magnitude. The plane of the lunar orbit is at first practically identical with the earth's equator, but as the moon recedes from the earth the sun's attraction begins to make itself felt. We shall not attempt to trace the complex changes by which the plane of the lunar orbit is affected. It must suffice to say that the present small inclination of the lunar orbit to the ecliptic accords with the theory.

As soon as the earth rotates with twice the angular velocity with which the moon revolves in her orbit, a new instability sets in. The month is then about twelve of our present hours, and the day about six such hours in length. The inclination of the equator to the ecliptic now begins to increase and continues to do so until finally it reached its present value of $23\frac{1}{2}°$. All these changes continue and no new phase now supervenes, and at length we have the system in its present configuration. The minimum time in which the changes from first to last can have taken place is 54,000,000 years.

Distortion of Plastic Planet.

There are other collateral results which must arise from a supposed primitive viscosity or plasticity of the earth's mass. For during this course of evolution the earth's mass must have suffered a screwing motion, so that the polar regions have travelled a little from west to east relatively to the equator. This affords a possible explanation of the north and south trend of our great continents. The whole of this argument reposes on the imperfect rigidity of solids and on the internal friction of semi-solids and fluids; these are *verae causae.* Thus changes of the kind here discussed must be going on, and must have gone on in the past. And for this history of the earth and moon to be true throughout, it is only necessary to postulate a sufficient lapse of time, and that there is not enough matter diffused through space materially to resist the motions of the moon and earth in perhaps 200,000,000 years. It seems hardly too much to say that, granting these two postulates, and the existence of a

The Theory Postulates Sufficient Lapse of Time.

---

[1] See criticism, by Nolan, *Genesis of Moon* (Melbourne, 1885); also *Nature* (Feb. 18, 1886).

primeval planet such as that above described, a system would necessarily be developed which would bear a strong resemblance to our own. A theory, reposing on *verae causae* which brings into quantitative correlation the lengths of the present day and month, the obliquity of the ecliptic, and the inclination and eccentricity of the lunar orbit should have claims to acceptance.

§ 38. *The Influence of Tidal Friction on the Evolution of the Solar System and of the Planetary Sub-systems.*[1]—According to the nebular hypothesis of Kant and Laplace the planets and satellites are portions detached from contracting nebulous masses, and other theories have been advanced subsequently in explanation of the present configuration of the solar system. We shall here only examine what changes are called for by the present theory of tidal friction. It may be shown that the reaction of the tides raised in the sun by the planets must have had a very small influence in changing the dimensions of the planetary orbits round the sun, and it appears improbable that the planetary orbits have been sensibly enlarged by tidal friction since the origin of the several planets.

Planetary Sub-systems.

Similarly it appears unlikely that the satellites of Mars, Jupiter and Saturn originated very much nearer the present surfaces of the planets that we now observe them. But, the data being insufficient, we cannot feel sure that the alteration in the dimensions of the orbits of these satellites has not been considerable. It remains, however, nearly certain that they cannot have first originated almost in contact with the present surfaces of the planets, in the same way as in the preceding sketch has been shown to be probable with regard to the moon and earth. Numerical data concerning the distribution of moment of momentum in the several planetary sub-systems exhibit so striking a difference between the terrestrial system and those of the other planets that we should from this alone have grounds for believing that the modes of evolution have been considerably different. The difference appears to lie in the genesis of the moon close to the present surface of the planet, and we shall see below that solar tidal friction may be assigned as a reason to explain how it has happened that the terrestrial planet had contracted to nearly its present dimensions before the genesis of a satellite, but that this was not the case with the exterior planets. The efficiency of solar tidal friction is very much greater in its action on the nearer planets than on the farther ones. The time, however, during which solar tidal friction has been operating on the external planets is probably much longer than the period of its efficiency for the interior ones, and a series of numbers proportional to the total amount of rotation destroyed in the several planets would present a far less rapid decrease as we recede from the sun than numbers simply expressive of the efficiency of tidal friction at the several planets. Nevertheless it must be admitted that the effect produced by solar tidal friction on Jupiter and Saturn has not been nearly so great as on the interior planets. And, as already stated, it is very improbable that so large an amount of momentum should have been destroyed as materially to affect the orbits of the planets round the sun.

Distribution of Satellites Amongst the Planets.

We will now examine how the difference of distances from the sun may have affected the histories of the several planets. According to the nebula hypothesis, as a planetary nebula contracts, the increasing rapidity of the rotation causes it to become unstable, and an equatorial portion of matter detaches itself. The separation of that part of the mass which before the change had the greatest angular momentum permits the central portion to resume a planetary shape. The contraction and the increase of rotation proceed continually until another portion is detached, and so on. There thus recur at intervals epochs of instability, and something of the same kind must have occurred according to other rival theories. Now tidal friction must diminish the rate of increase of rotation due to contraction, and therefore if tidal friction and contraction are at work together the epochs of instability must recur more rarely than if contraction alone acted. If the tidal retardation is sufficiently great, the increase of rotation due to contraction will be so far counteracted as never to permit an epoch of instability to occur. Since the rate of retardation due to solar tidal friction decreases rapidly as we recede from the sun, these considerations accord with what we observe in the solar system. For Mercury and Venus have no satellites, and there is progressive increase in the number of satellites as we recede from the sun. Whether this be the true cause of the observed distribution of satellites amongst the planets or not, it is remarkable that the same cause also affords an explanation, as we shall now show, of that difference between the earth with the moon and the other planets with their satellites which has caused tidal friction to be the principal agent of change with the former, but not with the latter.

Case of Earth and Moon Different from others.

In the case of the contracting terrestrial mass we may suppose that there was for a long time nearly a balance between the retardation due to solar tidal friction and the acceleration due to contraction, and that it was not until the planetary mass had contracted to nearly its present dimensions that an epoch of instability could occur. It may also be noted that if there be two equal planetary masses which generate satellites, but under very different conditions as to the degree of condensation of the masses, the two satellites will be likely to differ in mass; we cannot, of course, tell which of the two planets would generate the larger satellite. Thus, if the genesis of the moon was deferred until a late epoch in the history of the terrestrial mass, the mass of the moon relatively to the earth would be likely to differ from the mass of other satellites relatively to their planets. If the contraction of the planetary mass be almost completed before the genesis of the satellite, tidal friction will thereafter be the great cause of change in the system; and thus the hypothesis that it is the sole cause of change will give an approximately accurate explanation of the motion of the planet and satellite at any subsequent time. We have already seen that the theory that tidal friction has been the ruling power in the evolution of the earth and moon co-ordinates the present motions of the two bodies and carries us back to an initial state when the moon first had a separate existence as a satellite; and the initial configuration of the two bodies is such that we are led to believe that the moon is a portion of the primitive earth detached by rapid rotation or by other causes.

Let us now turn to the other planetary sub-systems. The satellites of the larger planets revolve with short periodic times; for the smallness of their masses would have prevented tidal friction from being a very efficient cause of change in the dimensions of their orbits, and the largeness of the planet's masses would have caused them to proceed slowly in their evolution. The satellites of Mars present one of the most remarkable features in the solar system, for, whereas Mars rotates in 24h. 37m., Deimos has a period of 30h. 18m. and Phobos of only 7h. 39m. The minuteness of these satellites precludes us from supposing that they have had much influence on the rotation of the planet, or that the dimensions of their own orbits have been much changed.

Satellites of Mars.

The theory of tidal friction would explain the shortness of the periodic time of Phobos by the solar retardation of the planet's rotation, which would operate without directly affecting the satellites' orbital motion. We may see that, given sufficient time, this must be the ultimate fate of all satellites. Numerical comparison shows that the efficiency of solar tidal friction in retarding the terrestrial and martian rotations is of about the same degree of importance, notwithstanding the much greater distance of the planet Mars. In the above discussion it will have been apparent that the earth and moon do actually differ from the other planets to such an extent as to permit tidal friction to have been the most important factor in their history.

Summary.

By an examination of the probable effects of solar tidal friction on a contracting planetary mass, we have been led to assign a cause for the observed distribution of satellites in the solar system, and this again has itself afforded an explanation of how it happened that the moon so originated that the tidal friction of the lunar tides in the earth should have been able to exercise so large an influence. We have endeavoured not only to set forth the influence which tidal friction may have, and probably has had in the history of the system, if sufficient time be granted, but also to point out what effects it cannot have produced. These investigations afford no grounds for the rejection of theories more or less akin to the nebular hypothesis; but they introduce modifications of considerable importance. Tidal friction is a cause of change of which Laplace's theory took no account; and, although the activity of that cause may be regarded as mainly belonging to a later period than the events described in the nebular hypothesis, yet it seems that its influence has been of great, and in one instance of even paramount, importance in determining the present condition of the planets and their satellites.

Limitation of Time.

Throughout the whole of this discussion it has been supposed that sufficient time is at our disposal. Yet arguments have been adduced which seemed to show that this supposition is not justifiable, for Helmholtz, Lord Kelvin and others have attempted to prove that the history of the solar system must be comprised within a period considerably less than a hundred million years.[2] But the discovery of radio-activity and the consequent remarkable advances in physics throw grave doubt on all such arguments, and we believe that it is still beyond our powers to assign definite numerical limits to the age of the solar system.

Dr T. J. J. See (*Researches on the Evolution of Stellar Systems;* vol. ii. (1910) *Capture Theory*) rejects the applicability of tidal friction to the cosmogony of the solar system, and argues that the satellites were primitively wandering bodies and were captured by the gravitational attraction of the planets. Such captures are considered by Dr See to be a necessary result of the presence in space of a resisting medium; but the present writer does not feel convinced by the arguments adduced. (G. H. D.)

TIDORE or TIDOR, an island of the Malay Archipelago, off the W. coast of Halmahera, S. of Ternate. It is nearly circular and has an area of about 30 sq. m. Several quiescent volcanic peaks, reaching 5700 ft., occupy most of the island, and are covered with forests. The capital, Tidore, on the east coast, is a walled town and the seat of a sultan tributary to the Dutch

[1] A review of this and of cognate subjects is contained in G. H. Darwin's presidential address to the Brit. Assoc. in 1905.

[2] Thomson and Tait's *Nat. Phil.*, app. E; *Nature* (Jan. 27, 1887); Wolf, *Théories cosmogoniques* (1886).

and of a Dutch *controleur* (commissioner or agent). By an agreement of 1879 the sultan exercises authority over some parts of Halmahera, the Papuan Islands, the western half of New Guinea and the islands in Geelvink Gulf. The sultanate is included in the residency of Ternate (*q.v.*). The population, of Malay race and Mahommedans in religion, is about 8000. They live by agriculture (cotton, tobacco, nutmegs, &c.) and fishing.

TIECK, JOHANN LUDWIG (1773–1853), German poet, novelist and critic, was born in Berlin on the 31st of May 1773, his father being a rope-maker. He was educated at the Friedrich-Werdersche Gymnasium, and at the universities of Halle, Göttingen and Erlangen. At Göttingen Shakespeare and the Elizabethan drama were the chief subjects of his study. In 1794 he returned to Berlin, resolved to make a living by his pen. He contributed a number of short stories (1795–1798) to the series of *Straussfedern*, published by the bookseller C. F. Nicolai and originally edited by J. K. A. Musäus, and wrote *Abdallah* (1796) and a novel in letters, *William Lovell* (3 vols. 1795–1796). These works are, however, immature and sensational in tone. Tieck's transition to romanticism is to be seen in the series of plays and stories published under the title *Volksmärchen von Peter Lebrecht* (3 vols., 1797), a collection which contains the admirable fairy-tale *Der blonde Eckbert*, and the witty dramatic satire on Berlin literary taste, *Der gestiefelte Kater*. With his school and college friend W. H. Wackenroder (1773–1798), he planned the novel *Franz Sternbalds Wanderungen* (vols. i–ii. 1798), which, with Wackenroder's *Herzensergiessungen* (1798), was the first expression of the romantic enthusiasm for old German art. In 1798 Tieck married and in the following year settled in Jena, where he, the two brothers Schlegel and Novalis were the leaders of the new Romantic school. His writings between 1798 and 1804 include the satirical drama, *Prinz Zerbino* (1799), and *Romantische Dichtungen* (2 vols., 1799–1800). The latter contains Tieck's most ambitious dramatic poems, *Leben und Tod der heiligen Genoveva*, *Leben und Tod des kleinen Rotkäppchens*, which were followed in 1804 by the remarkable "comedy" in two parts, *Kaiser Oktavianus*. These dramas, in which Tieck's poetic powers are to be seen at their best, are typical plays of the first Romantic school; although formless, and destitute of dramatic qualities, they show the influence of both Calderon and Shakespeare. *Kaiser Oktavianus* is a poetic glorification of the middle ages.

In 1801 Tieck went to Dresden, then lived for a time near Frankfort-on-the-Oder, and spent many months in Italy. In 1803 he published a translation of *Minnelieder aus der schwäbischen Vorzeit*, between 1799 and 1804 an excellent version of *Don Quixote*, and in 1811 two volumes of Elizabethan dramas, *Altenglisches Theater*. In 1812–1817 he collected in three volumes a number of his earlier stories and dramas, under the title *Phantasus*. In this collection appeared the stories *Der Runenberg*, *Die Elfen*, *Der Pokal*, and the dramatic fairy tale, *Fortunat*. In 1817 Tieck visited England in order to collect materials for a work on Shakespeare (unfortunately never finished) and in 1819 he settled permanently in Dresden; from 1825 on he was literary adviser to the Court Theatre, and his semi-public readings from the dramatic poets gave him a reputation which extended far beyond the Saxon capital. The new series of short stories which he began to publish in 1822 also won him a wide popularity. Notable among these are *Die Gemälde*, *Die Reisenden*, *Die Verlobung*, *Des Lebens Überfluss*. More ambitious and on a wider canvas are the historical or semi-historical novels, *Dichterleben* (1826), *Der Aufruhr in den Cevennen* (1826, unfinished), *Der Tod des Dichters* (1834); *Der junge Tischlermeister* (1836; but begun in 1811) is an excellent story written under the influence of Goethe's *Wilhelm Meister; Vittoria Accorombona* (1840), in the style of the French Romanticists, shows a falling-off. In later years Tieck carried on a varied literary activity as critic (*Dramaturgische Blätter*, 2 vols., 1825–1826; *Kritische Schriften*, 2 vols., 1848); he also edited the translation of Shakespeare by A. W. Schlegel, who was assisted by Tieck's daughter Dorothea (1799–1841) and by Graf Wolf Heinrich Baudissin (1789–1878); *Shakespeares Vorschule* (2 vols., 1823–1829); the works of H. von Kleist (1826) and of J. M. R. Lenz (1828). In 1841 Friedrich Wilhelm IV. of Prussia invited him to Berlin where he enjoyed a pension for his remaining years. He died on the 28th of April 1853.

Tieck's importance lay rather in the readiness with which he adapted himself to the new ideas which arose at the close of the 18th century, than in any conspicuous originality or genius. His importance as an immediate force in German poetry is restricted to his early period. In later years it was as the helpful friend and adviser of others, or as the well-read critic of wide sympathies, that Tieck distinguished himself.

Tieck's *Schriften* appeared in 20 vols. (1828–1846), and his *Gesammelte Novellen* in 12 (1852–1854). *Nachgelassene Schriften* were published in 2 vols. in 1855. There are several modern editions of *Ausgewählte Werke* by H. Welti (8 vols., 1886–1888); by J. Minor (in Kürschner's *Deutsche Nationalliteratur*, 144, 2 vols., 1885); by G. Klee (with an excellent biography, 3 vols., 1892), and G. Witkowski (4 vols., 1903). *The Elves* and *The Goblet* were translated by Carlyle in *German Romance* (1827), *The Pictures* and *The Betrothal* by Bishop Thirlwall (1825). A translation of *Vittoria Accorombona* was published in 1845. Tieck's Letters have not yet been collected, but *Briefe an Tieck* were published in 4 vols. by K. von Holtei in 1864. See for Tieck's earlier life R. Köpke, *Ludwig Tieck* (2 vols., 1855); for the Dresden period, H. von Friesen, *Ludwig Tieck: Erinnerungen* (2 vols., 1871); also A. Stern, *Ludwig Tieck in Dresden* (*Zur Literatur der Gegenwart*, 1879); J. Minor, *Tieck als Novellendichter* (1884); B. Steiner, *L. Tieck und die Volksbücher* (1893); H. Bischof, *Tieck als Dramaturg* (1897); W. Miessner, *Tiecks Lyrik* (1902).

TIEDEMANN, FRIEDRICH (1781–1861), German anatomist and physiologist, eldest son of Dietrich Tiedemann (1748–1803), a philosopher and psychologist of considerable repute, was born at Cassel on the 23rd of August 1781. He graduated in medicine at Marburg in 1804, but soon abandoned practice. He devoted himself to the study of natural science, and, betaking himself to Paris, became an ardent follower of Baron Cuvier. On his return to Germany he maintained the claims of patient and sober anatomical research against the prevalent speculations of the school of Lorenz Oken, whose foremost antagonist he was long reckoned. His remarkable studies of the development of the human brain, as correlated with his father's studies on the development of intelligence, deserve mention. He spent most of his life as professor of anatomy and physiology at Heidelberg, a position to which he was appointed in 1816, after having filled the chair of anatomy and zoology for ten years at Landshut, and died at Munich on the 22nd of January 1861.

TIEL, a town in the province of Gelderland, Holland, on the right bank of the Waal (here crossed by a pontoon bridge), 25 m. by rail west of Nijmwegen. Pop. (1900), 10,788. It possesses fine streets and open places, but of its fortifications the Kleiberg Gate (1647) alone remains. The principal buildings are St Martin's church (15th century), the town hall, court-house and the historical castle of the family of van Arkel. In 1892 a harbour was built, but the shipping of Tiel is now chiefly confined to craft for inland navigation. It carries on a flourishing trade, especially in fruit, and is an important market for horses and cattle. It also manufactures agricultural implements, furniture, paper, tobacco, &c.

Five miles W.N.W. of Tiel is the small town of Buren, which contains some interesting old houses and is an important market for horses. Buren was the seat of an independent lordship which is mentioned as early as 1152. In later times it was held in fief, first from the dukes of Brabant, then from the dukes of Gelderland. In 1492 the emperor Charles V. raised it to a countship, and in 1551 it passed by marriage to Prince William of Orange Nassau. The title is now sometimes used by the royal family of the Netherlands when travelling incognito. The castle was destroyed in the beginning of the 19th century, and the site of it is now marked by the park on the west side of the town. It contained not less than 170 apartments and was memorable for the imprisonment within its walls of Arnoud duke of Gelderland (d. 1473), and as the birthplace of Philip William of Orange in 1554.

TIELE, CORNELIS PETRUS (1830–1902), Dutch theologian and scholar, was born at Leiden on the 16th of December 1830. He was educated at Amsterdam, first studying at the Athenaeum Illustre, as the communal high school of the capital was then named, and afterwards at the seminary of the Remonstrant Brotherhood. He was destined for the pastorate in his own brotherhood. After steadily declining for a considerable period, this had increased its influence in the second half of the 19th century by widening the inelastic tenets of the Dutch Methodists, which had caused many of the liberal clergy among the Lutherans and Calvinists to go over to the Remonstrants. Tiele certainly had liberal religious views himself, which he early enunciated from the pulpit, as Remonstrant pastor of Moordrecht (1853) and at Rotterdam (1856). Upon the removal of the seminary of the brotherhood from Amsterdam to Leiden in 1873, Tiele was appointed one of its leading professors. In 1877 followed his appointment at the university of Leiden as professor of the history of religions, a chair specially created for him. Of his many learned works, the *Vergelijkende geschiedenis van de egyptische en mesopotamische Godsdiensten* (1872), and the *Geschiedenis van den Godsdienst* (1876; new ed. 1891), have been translated into English, the former by James Ballingall (1878–1882), the latter by J. Estlin Carpenter (1877) under the title "Outlines of the History of Religion" (French translation, 1885; German translation, 1895). A French translation of the *Comparative History* was published in 1882. Other works by Tiele are: *De Godsdienst van Zarathustra, van het Ontstaan in Baktrië, tot den Val van het Oud-Perzische Rijk* (1864) a work now embodied, but much enlarged and improved by the latest researches of the author, in the *History of Religions* (vol. ii. part ii., Amsterdam, 1901), a part which appeared only a short time before the author's death; *De Vrucht der Assyriologie voor de vergelijkende geschiedenis der Godsdiensten* (1877; German ed., 1878); *Babylonisch-assyrische Geschichte* (two parts, Leipzig, 1886–1888); *Western Asia, according to the most Recent Discoveries* (London, 1894). He was also the writer of the article "Religions" in the 9th edition of the *Ency. Brit.* A volume of Tiele's sermons appeared in 1865, and a collection of his poems in 1863. He also edited (1868) the poems of Petrus Augustus de Génestet. Tiele was best known to English students by his *Outlines* and the Gifford Lectures "On the Elements of the Science of Religion," delivered in 1896–1898 at Edinburgh University. They appeared simultaneously in Dutch at Amsterdam, in English in London and Edinburgh (1897–1899, 2 vols.). Edinburgh University in 1900 conferred upon Tiele the degree of D.D. *honoris causâ*, an honour bestowed upon him previously by the universities of Dublin and Bologna. He was also a fellow of at least fifteen learned societies in Holland, Belgium, France, Germany, Italy, Great Britain and the United States. He died on the 11th of January 1902. In 1901 he had resigned his professorship at Leiden University. Tiele's zeal and power for work were as extraordinary as his vast knowledge of ancient languages, peoples and religions, upon which his researches, according to F. Max Müller, have shed a new and vivid light. With Abraham Kuenen and J. H. Scholten, amongst others, he founded the "Leiden School" of modern theology. From 1867 he assisted A. Kuenen, A. D. Loman and L. W. Rauwenhoff editing the *Theologisch Tijdschrift*.

His brother Pieter Anton Tiele (1834–1888) acted for many years as the librarian of Utrecht University, and distinguished himself by his bibliographical studies, more especially by his several works on the history of colonization in Asia. Among these the most noteworthy are: *De Opkomst van het nederlandsch Gezag in Oost-Indie* (1886); *De Vestiging der Portugeezen, in Indie* (1873), and other books on the early Portuguese colonization in the Malay Archipelago.

TIENTSIN, the largest commercial city in Chih-li, the metropolitan province of China. Pop. (1907), about 750,000. It is situated at the junction of the Peiho and the Hun-ho, which is connected by the grand Canal with the Yangtsze-kiang. It is a prefectural city, and has, since the conclusion of the foreign treaties, become the residence of the viceroy of the province during a great portion of the year. The town is built on a vast alluvial plain, which extends from the mountains beyond Peking to the sea, and through which the Peiho runs a circuitous course, making the distance by water from Tientsin to the coast about 70 m. as against 30 m. by railway.

The appearance of the city has greatly changed since the Boxer rising in 1900. After that event the city walls, which measured about three quarters of a mile each way, were razed, wide streets were made, the course of the river straightened, electric lighting and tramways introduced and a good water service supplied. Among the public buildings are a university (in which instruction is given in western learning) and an arsenal. There are several cotton mills and important rice and salt markets. The city has always been a great commercial depot; a wharf nearly two miles long affords ample facilities for vessels able to cross the bar of the Peiho, over which there is a depth of water varying from 9 to 12 ft.

In 1907 the imports amounted to 79,500,000 taels (a tael in 1907 averaged 3s. 3d.); viz. foreign imports 61,200,000, native imports 18,317,000 taels; the exports in the same year amounted to 17,253,000. Valuable cargoes of tea are landed here for carriage overland, via Kalgan and Kiakhta, to Siberia. During the winter the river is frozen. The principal articles of import are shirtings, drills, jeans and twills, opium, woollens, steel, lead, needles, Japanese sea-weed and sugar; and of export, wool, skins, beans and pease, straw braid, coal, dates, tobacco and rhubarb. The coal exported is brought from the Kaiping colliery to the east of Tientsin; its output in 1885 was 181,039 tons and in 1904 28,956 tons.

The importance of Tientsin has been enhanced by the railways connecting it with Peking on the one hand and with Shanhai-kwan and Manchuria on the other. The British concession, in which the trade centres, is situated on the right bank of the river Peiho below the native city, and occupies some 200 acres. It is held on a lease in perpetuity granted by the Chinese government to the British Crown, which sublets plots to private owners in the same way as is done at Hankow. The local management is entrusted to a municipal council organized on lines similar to those which obtain at Shanghai. Besides the British concession the French, Germans, Russians, Japanese, Austrians, Italians and Belgians have separate settlements, five miles in all, the river front being governed by foreign powers.

In 1853 Tientsin was besieged by an army of T'aip'ing rebels, which had been detached from the main force at Nanking for the capture of Peking. The defences of Tientsin, however, saved the capital, and the rebels were forced to retreat. Five years later Lord Elgin, accompanied by the representative of France, steamed up the Peiho, after having forced the barriers at Taku, and took peaceable possession of the town. Here the treaty of 1858 was signed. But in 1860, in consequence of the treacherous attack made on the British plenipotentiary the preceding year at Taku, the city and suburbs were occupied by an allied British and French force, and were held for two years. The city was constituted an open port. On the establishment of Roman Catholic orphanages some years later the pretensions of the priests so irritated the people that on the occurrence of an epidemic in the schools in the year 1870 they attacked the French and Russian establishments and murdered twenty-one of the foreign inmates, besides numbers of their native followers. The Chinese government suppressed the riot, paid £80,000 in compensation and sent a representative to Europe to apologize for the outbreak.

During the period 1874–1894, when Li Hung-Chang was viceroy of Chih-li and *ex officio* superintendent of trade, he made Tientsin his headquarters and the centre of his experiments in military and naval education. As a consequence the city became the chief focus of enterprise and foreign progress. Having arrogated to himself the practical control of the foreign policy of the nation, Li's yamen became the scene of many important negotiations, and attracted distinguished visitors from all parts of the globe. The loss of prestige consequent on the Japanese War brought about the retirement of Li, and with it the political importance of Tientsin ceased. Both the foreign concessions and the native city suffered severely during the hostilities resulting from the Boxer movement in June–July, 1900. (See China: *History* § D.)

TIEPOLO, GIOVANNI BATTISTA (1692–1769), Italian painter, was born at Venice, and acquired the rudiments of his art from Gregorio Lazzarini, and probably from Piazzetta, though the decisive influence on the formation of his style was the study of Paolo Veronese's sumptuous paintings. When hardly out of his teens he developed an extraordinary facility of brushwork, and proved himself, as a fresco-painter, a colourist of the first order, though this early mastery of technique made him frequently neglect form and composition. The more solid qualities of Paolo Veronese—depth of thought and balance of design—are frequently wanting in his work, but he approaches the earlier master in richness of colour and in the management of difficult effects of lighting. He decorated many Venetian churches and palaces with ceilings and frescoes full of turbulent movement and rich colour, extending his operations to the near cities of the mainland and to Bergamo (Colleoni Chapel) and Milan (ceiling at Palazzo Chierici). In 1750 he proceeded to Würzburg to paint the magnificent ceilings and frescoes at the archbishop's palace. From 1753 to about 1763 he worked again at Venice and in the cities of north-east Italy, until he was summoned to Madrid by Charles III. to paint some frescoes for the royal palace. He died at Madrid in 1769. He was the last important figure in Venetian art, and at the same time the initiator of the baroque period.

Tiepolo's altarpieces and easel pictures show more clearly even than his frescoes how deeply he was imbued with the spirit of Paolo Veronese, for in these smaller works he paid more attention to the balance of composition, whilst retaining the luminosity of his colour harmonies. The majority of his works, both in fresco and in oils, are to be found in Venice in the churches of S. Aloise, SS. Apostoli, Gesuati, SS. Giovanni e Paolo, in the Scalzi, and the Scuola del Carmine, the Academy, and the Palazzi Labia, Rezzonico, and Quirini-Stampalia, and the Doge's Palace. Besides the cities already mentioned, Padua, Udine, Parma and Vicenza boast of fine examples of his work. At the National Gallery are two designs for altarpieces, a "Deposition from the Cross," "Esther at the Throne of Ahasuerus," and "The Marriage of Marie de Médicis." Two versions of "Christ and the Adulteress" are in the collection of Dr L. Richter. Other easel pictures by Tiepolo are at the Louvre, and at the Berlin and Munich galleries. His paintings in Madrid belong to the closing years of his life and show signs of waning power. Tiepolo also executed some notable work with the etching-needle, the list comprising some fifty plates. His two sons, Giovanni Domenico (about 1726–1804) and Lorenzo, did not attain to his excellence.

See *Les Tiepolo*, by Henry de Chennevières (Paris, 1898); and Pompeo Molmenti, *G. B. Tiepolo* (Milan, 1910).

TIERNEY, GEORGE (1761–1830), English Whig politician, was born at Gibraltar on the 20th of March 1761, being the son of a wealthy Irish merchant of London, who was living there as prize agent. He was sent to Eton and Peterhouse, Cambridge, where he took the degree of LL.B. in 1784, and was called to the bar; but he abandoned law and plunged into politics. He contested Colchester in 1788, when both candidates received the same number of votes, but Tierney was declared elected. He was, however, defeated in 1790. He sat for Southwark from 1796 to 1806, and then represented in turn Athlone (1806–1807), Bandon (1807–1812), Appleby (1812–1818), and Knaresborough (1818–1830). When Fox seceded from the House of Commons, Tierney became a prominent opponent of Pitt's policy. In 1797 Wilberforce noted in his diary that Tierney's conduct was "truly Jacobinical"; and in May 1798 Pitt accused him of want of patriotism. A duel ensued at Putney Heath on Sunday, the 27th of May 1798; but neither combatant was injured. In 1803 Tierney, partly because peace had been ratified with France and partly because Pitt was out of office, joined the ministry of Addington as treasurer of the navy, and was created a privy councillor; but this alienated many of his supporters among the middle classes, and offended most of the influential Whigs. On the death of Fox he joined (1806) the Grenville ministry as president of the board of control, with a seat in the cabinet, and thus brought himself once more into line with the Whigs. After the death of George Ponsonby in 1817 Tierney became the recognized leader of the opposition in the House of Commons. In Canning's ministry he was master of the mint, and when Lord Goderich succeeded to the lead Tierney was admitted to the cabinet; but he was already suffering from ill-health and died suddenly at Savile Row, London, on the 25th of January 1830.

Tierney was a shrewd man of the world, with a natural aptitude for business. His powers of sarcasm were a cause of terror to his adversaries, and his presence in debate was much dreaded. His arguments were felicitous, and his choice of language was the theme of constant admiration. Lord Lytton, in his poem of St Stephen's, alludes to "Tierney's airy tread," and praises his "light and yet vigorous" attack, in which he inflicted, "with a placid smile," a fatal wound on his opponent.

TIERRA DEL FUEGO, an archipelago at the southern extremity of South America, from which it is separated by Magellan Strait, at the First Narrows and other points scarcely a mile wide. The group lies between 52° 40′ and 55° 59′ S. and 63° 30′ and 74° 30′ W. stretching nearly in a line with the Patagonian Andes for over 400 m. N.W. and S.E., between Capes Pillar (Desolation Island) and Horn, and for about 270 m. W. and E. from Cape Pillar to Catherine Point at the north of the main island of Tierra del Fuego. Southwards it tapers to 120 m. between Capes Horn and San Diego, east of which extends Staten Island, which terminates in Cape St John. The boundary between Argentina and Chile has been settled in such a manner that Argentina holds that part of the main island of Tierra del Fuego which is situated east of the meridian of Cape Espiritu Santo, the frontier striking the north shore of Beagle Channel about its centre; and Chile holds all the western part of the main island and the other numerous islands to the west and to the south of Beagle Channel. The Argentine side is known as the Territory of Tierra del Fuego (including Staten Island), and the Chilean forms part of the Territory of Magallanes. Although on ordinary maps this region presents to the eye a hopelessly confused aggregate of islands, channels and fjord-like inlets, it is nevertheless clearly disposed in three main sections: (1) the main island; (2) the islands to the south, from which it is separated by Beagle Channel; (3) the islands to the west, marked off from those to the south by the Brecknock Peninsula.

Knowledge of these lands increased considerably during the later years of the 19th century, and their reputation for dreariness has been favourably modified. The climate in the eastern and southern regions is not so rigorous as was believed, there are no barren lands, the soil is fertile and can support fruitful industries, and the aborigines are far from being so dangerous as they were once considered to be. The greater part of the main island of Tierra del Fuego is formed by the continuation of the Tertiary beds of the Patagonian tableland cut by the transversal depression of Magellan Strait and by the low land extending from Useless Bay on the west to San Sebastian Bay on the east, of so recent origin that there exist still some salt lakes, this depression being represented in the old charts as an inter-oceanic passage for small boats. Although in 1880 numerous prospectors discovered extensive deposits of alluvial gold, its exploitation was not generally successful, and farms took the place of mines. By the end of the 19th century 120 square miles had been occupied by cattle and sheep on the Argentine side, and about the same extent on the Chilean; and the cattle industry proved very profitable.

The undulating tableland has an average height of 300 ft. above the sea, and its climate, however cold in winter—in 1892 and 1893 the temperature reached 12·6° F.—allows of the cultivation of barley, oats and occasionally potatoes, which, however, grow better along Beagle Channel. To the south the tableland is higher and more broken, being drained by the Silva and Grande, among smaller rivers, the Grande being navigable in some parts by small craft. To the west and south-west the general character of the land changes; the ends of the Tertiary beds are raised in small hills and Mesozoic rocks appear, forming broken ridges of the Pre-Cordillera, a name given on the continent to the ridges which precede, to the east, the Andes. In this region appears the Antarctic forest in which predominates the *Fagus antarctica* and *F. betuloides*, *Drymis Winteri*, *Berberis licifolia*, *Pernettia*, *Desfonteinia* and *Philesia buxifolia*. Lake Solier and Lake Fagnano receive the waters of these mountains and hills. Lake Fagnano is only 180 ft. above the sea, and its depth reaches 700 ft. To the south of the lake rises the south-eastern prolongation of the Cordillera of the Andes, with ridges of a uniform height of 3500 ft., in which predominate crystalline schists which do not seem to be very old. Some peaks of Tertiary granite break the uniformity, such as Mt Sarmiento (7200 ft.), Mt Darwin, of which two peaks have been measured (6201 and 7054 ft.), and Mt Olivaia (4324 ft.). Sarmiento, the culminating point of the archipelago, was generally supposed to be volcanic, but it presents such extremely precipitous flanks that John Ball considered it more probably "a portion of the original rock skeleton that formed the axis of the Andean chain during the long ages that preceded the great volcanic outbursts that have covered the framework of the western side of South America."[1] Sir Martin Conway, who ascended it, ascertained that it is not a volcano. This is altogether an alpine region with numerous snow-clad summits and glaciers descending down to the sea. Deep valleys, which seem to be only the prolongation of fjords, penetrate into the chain in the southern slope where exist several harbours on which settlements have been founded. Yendegaia, Lapatia and Ushuaia Bays are among the larger. Ushuaia is the site of the capital of the Argentine Territory, and has shown considerable development, having regular communication by monthly steamers with Buenos Aires, while smaller steamers serve the different settlements along the coast. Cattle farms prosper along Beagle Channel, the timber industry is growing, lignite seams have been discovered, and alluvial gold is washed principally at Slogget Bay. These regions, as they become more known, may even invite the attention of tourists by their sublime scenery. Staten Island to the east of Tierra del Fuego has been settled by the Argentine government; there are a prison and lighthouse at St John Harbour, and a first-class permanent meteorological and magnetic station.

The division of the archipelago to the south of Beagle Channel includes the islands of Hoste, Navarin, Gordon, Londonderry, Stewart, Wollaston and numerous islets, disposed in triangular form with the base on Beagle Channel and the apex at the rocky headland of Cape Horn. At its west end Beagle Channel takes the name of Darwin Sound, which leads to the Pacific at the Londonderry and Stewart Islands. Partial exploration in this region was conducted by the French Mission du Cap Horn in 1882–1883, and the geological foundations are granite and basic volcanic rocks. The western group of islands, demarcated by Brecknock Peninsula, includes Clarence Island and Captain Cook's Desolation Land, with Dawson Island and numerous rocks and islets. Desolation Land was supposed by Cook to form a continuous mass stretching from the western entrance of Magellan Strait to Cockburn Channel, but it actually consists of several islands, separated from each other by very narrow channels flowing between the Pacific and the western branch of Magellan Strait. The name Desolation is given to the northern member of the group terminating at Cape Pillar; the southernmost and largest island nearer to Clarence Island, is Santa Iñes. In other cases small surveys among these fjords have shown that several of the larger islands are cut by channels which separate them into smaller ones, while elsewhere the low valleys which unite the mountains and hills are the result of post-Glacial deposits that have filled part of the former channels, these islands being the summits of an old continuous half-submerged mountain chain. At Dawson Island the Chilean government has established settlements, and a Roman Catholic mission has carried on work among the Alakaluf Indians.

Climate.—At Ushuaia ten years' meteorological observations[2] have shown a mean annual temperature of 42·84° F., with a winter mean of 34·7° and a summer mean of 50·18°. These figures show that tolerably mild winters (as a whole, apart from the extremes of cold already indicated) are followed by cool summers, both seasons being accompanied by overcast skies, constant and sudden changes from fair to foul weather; while fogs, mists, rains, snows and high winds (prevailing throughout the year) endanger the navigation of the intricate inland channels. The precipitation during ten years at Ushuaia has been observed to average 24·8 in. But on the southern seaward islands, under the influence of the prevalent westerly or south-westerly winds, it is very much heavier, and reaches 59 in. at Staten Island.

Fauna.—In the main island of Tierra del Fuego, the low-lying plains with their rich growth of tall herbage are frequented by the rhea, guanaco and other animals common to the adjoining mainland. In the southern and western islands the fauna is restricted mainly to foxes, bats, rats, mice, the sea otter, the penguin and other aquatic birds, and various cetaceans in the surrounding waters.

Inhabitants.—To the three geographical divisions correspond three well-marked ethnical groups—the Onas of the main island, the Yagans (Yahgans) of the south and the Alakalufs of the west. With the settlement of the main island, which is now sometimes called Onisia, leaving the name of Tierra del Fuego to the archipelago, the Onas tribe has become fairly known. Their origin, like that of the other groups, is obscure. Undoubtedly among these Indians are many that recall some Patagonian types; it seems that they are not the same as the Tehuelche type, but that they pertain to one of the races that in earlier times existed in Patagonia. Their language is closely allied to that called Old Tehuelche; it is a hard, slow-spoken speech, not at all resembling the soft, rapidly-spoken language of the Yagans, which has many points of similarity with that of the Alakalufs. The isolation of the Onas is peculiarly marked, inasmuch as they are an insular people who do not use boats. Their life is nomadic, and they are hunters, living upon the flesh of the guanaco, and using only tussock-roots and wild celery for vegetable food. Their skill in and necessary devotion to the chase influence their whole mode of life; "their moral code is based upon a standard of physical culture and health."[3] They live in small groups, every member of which is connected by family ties; between these groups, as in the case of the Yagans and Alakalufs, the vendetta is common. They have no gods, though certain legends are preserved. They have maintained their stock untainted, and have withstood the influence of the white man to a remarkable degree (for example, they use no spirituous or fermented drink), though they have suffered a serious decrease in numbers at his hands. The men average about 5 ft. 10 in. in height; the women 5 ft. 6 in. They are of a light copper colour, with black straight hair, and remarkably muscular. The Yagans live under conditions of extraordinary rigour. In order to obtain food, they venture naked in small canoes into the treacherous seas; their life is a constant battle with starvation and a rude climate, and their character has become rude and low in consequence. They have no higher social unit than the family. On the authority of Charles Darwin they have been held by many to be cannibals, but they are not, although those suffering from incurable ailments are often put to death. Although taller than the Negritoes of the eastern hemisphere (4 ft. 10 in. to 5 ft. 4 in.), the Yagans present in some respects a more debased type characterized by low brows, prominent zygomatic arches, large tumid lips, flat nose, loose wrinkled skin, black restless eyes very wide apart, coarse black unkempt hair, and head and chest disproportionately large compared with the extremely slender and outwardly curved legs. The missionaries, who have reduced the language to writing (Gospel of St Luke, London, 1881), assert that it contains no fewer than 30,000 words, although the numerals stop at *five*, already a compound form, and although the same word expresses both *hand* and *finger*; but it appears that a large number of the words included in this total are compounds. Comparatively little is known about the Alakalufs. They have a reputation for treachery, and for assaults on shipwrecked crews. They are hunters both on land and on the water, using the bow and arrow like the Onas, and building canoes often of large size.

The aborigines are decreasing rapidly in the whole archipelago, and although the Rev. Thomas Bridges, who, as missionary first and then as farmer, resided thirty years there, calculated the population to be 10,000 when he arrived, towards the close of the 19th century it was estimated to be little more than 1000.

Tierra del Fuego was discovered by Fernando de Magellan in 1520, when he sailed through the strait named after him, and called this region the "Land of Fire," either from now extinct volcanic flames, or from the fires kindled by the natives along parts of his course. In 1578 Sir Francis Drake first sighted the point which in 1616 was named Cape Hoorn (anglicized Horn) by the Dutch navigators Jacob Lemaire and Willem Cornelis Schouten (1615–1617). In 1619 the brothers Garcia and Gonçalo de Nodal first circumnavigated the archipelago, which was afterwards visited at intervals by Captain Sir John Narborough (1670), M. de Gennes and the Sieur Froger (1696), Commodore John Byron (1764), Samuel Wallis and Philip Carteret (1767), James Cook (1768) and James Weddell (1822). But no systematic exploration was attempted until the British Admiralty undertook a thorough survey of the whole group by Philip Parker King (1826–1828) and Robert Fitzroy (1831–1836). The latter expedition (*Voyage of the "Beagle"*) was accompanied by Charles Darwin, then a young man. To these admirable surveys is due most of the present geographical terminology of the archipelago. Subsequently the work of exploration was continued by Dumont d'Urville (1837), Charles Wilkes (1839), Parker Snow (1855), various later travellers, a selection of whose works are quoted below, and British, American and Roman Catholic missionaries.

TIETJENS, THÉRÈSE JOHANNE ALEXANDRA (1831–1877), Hungarian soprano vocalist, was born at Hamburg on the 17th of July 1831. Her voice was trained at Hamburg, where she made a successful début in 1849 as Lucrezia Borgia in Donizetti's opera. Thence she proceeded to Frankfort and Vienna. She sang for the first time in London in 1858, appearing as Valentine in *Les Huguenots*. Her success was so great that for the rest of her life she made England her home, and soon gained as brilliant a reputation in concert and oratorio work as she had already won upon the stage. Her voice was a dramatic soprano of magnificent quality, and her powers as an actress were supreme. Her most famous parts were Fidelio, Medea (in Cherubini's opera) and Donna Anna (in Don Giovanni). She died in London on the 3rd of October 1877, having endeared herself to the English people as much by her private virtues as by her artistic gifts.

TIFFANY, CHARLES LEWIS (1812–1902), American jeweler, was born at Killingly, Connecticut, on the 15th of February 1812. At fifteen he became a clerk in his father's store, but removed to New York City in 1837, and with John B. Young opened a fancy goods store. In 1847 the firm began to manufacture gold jewelry, and in 1848, when the political unrest in Europe caused great depreciation in the price of precious stones, Tiffany invested heavily in diamonds, which were sold at a great profit a few years later. The firm became Tiffany, Young & Ellis in 1841 and was reorganized as Tiffany & Company (Mr Young and Mr Ellis retiring) in 1853. In 1851 the firm had established the sterling silver standard of ·925 fine, subsequently adopted by other jewelers; and in the same year had founded a branch house in Paris. In 1858 Tiffany bought the unused portion of the Atlantic telegraph cable which he made into cane handles or sold in sections. At the beginning of the Civil War, foreseeing that the jewelry business would suffer, he turned most of his capital to the manufacture of swords, medals and similar war material. In 1868 the company was incorporated, and branches were established at London and at Geneva. Tiffany made a speciality of importing historic gems, jewelry and art works, and in 1887 bought some of the crown jewels of France, paying for them about half a million dollars. He was made a chevalier of the Legion of Honour in 1878. He died in New York on the 18th of February 1902.

TIFFANY, LOUIS COMFORT (1848–), American artist, son of Charles L. Tiffany, was born in New York City, on the 18th of February 1848. He was a pupil of George Inness and of Samuel Coleman, New York, and of Léon Bailly, Paris. He became a member of the Society of American Artists (1877), of the National Academy of Design (1880), of the American Water Color Society, and of the Société Nationale des Beaux Arts, Paris. He travelled extensively in Europe, and painted in oil and water-colour, but subsequently devoted himself to decorative glass work. He became president and art director of the Tiffany Glass and Decorating Co., and produced a "Favrile" glass, of unusual beauty of colour.

TIFFIN, a city and the county-seat of Seneca county, Ohio, U.S.A., on the Sandusky river, about 40 m. S.S.E. of Toledo. Pop. (1900), 10,989, of whom 1168 were foreign-born; (1910 census), 11,894. Tiffin is served by the Baltimore & Ohio, the Cleveland. Cincinnati, Chicago & St Louis and the Pennsylvania railways, and by an electric line to Fostoria, about 12 m. west. It is the seat of an Ursuline College for girls, founded in 1863 and incorporated with power to confer degrees in 1878; and of Heidelberg University (Reformed Church), founded in 1850, incorporated as Heidelberg College in 1851 and reincorporated under its present name in 1890. The Heidelberg Theological Seminary was conducted here from 1850 to 1907, when it was combined with the "School of Theology" of Ursinus College, Collegeville, Pennsylvania, to form the Central Theological Seminary of the Reformed Church in the United States, which in 1908 was removed to Dayton, Ohio. In Tiffin are the St Francis Home (1869), and the National Orphans' Home (1897). The city had 87 factories in 1905, of which 54·2% were owned by individuals, and the value of the factory products was $2,434,502. Tiffin was settled in 1817, incorporated as a town in 1835, and chartered as a city in 1850, when the village of Ft. Ball, on the opposite side of the Sandusky, was consolidated with it. It was named in honour of Edward Tiffin (1766–1829), a native of Carlisle, England, who emigrated to the United States. He graduated at the University of Pennsylvania in 1789, removed in 1796 to Chillicothe, Ohio. where he practised medicine and was a local Methodist preacher. He was speaker of the House of Representatives of the North-west Territory in 1799, president (1802) of the convention which framed the first constitution of Ohio, the first governor of the state (1803–1807), a Democratic member of the United States Senate in 1807–1809, first commissioner of the United States General Land Office in 1812–1814, and surveyor-general of public lands north-west of the Ohio River in 1814–1829.

TIFLIS, a government of Russian Transcaucasia, occupying the eastern portion of the great valley which stretches between the main Caucasus range and the Armenian highlands, from the Meskes Mountains eastward, and extending up into the higher regions on both north and south. The district of Akhaltsikh lies actually on the Armenian highlands. The government is rich in minerals, but only copper is extracted, at Alaverdi and Akhtal; petroleum and other mineral springs are abundant. The government is drained by the Kura and its tributaries (Lyakhva, Aragva, Yora and Alazan), all of whose waters are largely used for irrigation; but in the lower parts of the valley there are extensive waterless steppes, Shirak and Karayaz, on the left bank of the Kura, which are chiefly inhabited by nomad Tatars. The area of the government is 15,601 sq. m. (17,140 with the Zakataly district), and the estimated population in 1906 was 1,081,900. The government is divided into nine districts, the chief towns of which are Tiflis, Akhalkalaki, Akhaltsikh, Dushet, Gori, Signakh and Telav. Agriculture is the principal occupation. Good silk is produced, especially in the region of Kakhetia. Livestock breeding is extensively carried on on the steppes. About one-fourth of the area is under forest. The natives exhibit remarkable skill in the manufacture of leather and metallic goods, felt, woollen stuffs (*e.g.* carpets and shawls) and gold embroidery.

TIFLIS, a town of Russian Caucasia, capital of the government of the same name and of the governor-generalship of Caucasia, picturesquely situated (44° 48′ E., 41° 42′ N.) at the foot of bare high mountains, on both banks of the river Kura, 300 ft. above the Black Sea. It is connected by rail with Poti and Batum (217 m.) on the Black Sea, with Baku on the Caspian Sea (342 m.), with Kars (185 m.), and, via Baku and Petrovsk, with the railway system of European Russia, which it joins at Beslan, near Vladikavkaz. Omnibuses also run regularly across the main range to Vladikavkaz, which by this route is only 133 m. distant. The heat in summer is excessive (mean, 73·4° F.), owing to the confined position; but the surrounding hills (1500 to 2400 ft.) shelter the town effectively from the cold winds of winter (mean, 34·7°). A large square, cathedrals, handsome streets, gardens, bridges, many fine buildings—among them the grand-ducal palace, the opera-house and the museum—European shops, the club or "circle," hotels and public offices, are evidence of western civilization. Among the modern public buildings are the Hall of Fame (1885), the Caucasian Museum, a cathedral of the Catholic Greek Church, and a sericultural museum. The chief of the older edifices is the (Sion) cathedral, which traces back its origin to the 5th century. Other churches date from the 14th and 15th centuries, the Armenian cathedral of Van from 1480, and the Catholic church from the 14th century. At Tiflis are the Caucasian branch of the Russian Geographical Society, an astronomical and a physical observatory, a botanical garden and museum, and a public library. There are cotton and silk factories, tanneries, soap-works and brick-works. The artisans of Tiflis are renowned as silversmiths, gunsmiths and sword-makers. Tiflis is the chief centre for the import of raw silk and silken goods, raw cotton, cottons, woollens, boots, tobacco, wine, carpets, and dried fruits from Persia and Transcaucasia, while manufactured wares are imported from Russia. The city has considerably developed, and had, in 1897, 160,645 inhabitants, as compared with 104,024 in 1883. They include Georgians, Russians, Germans, Persians and Tatars.

In the old division of Tiflis three distinct towns were included—Tiflis, Kal'a (the fort) and Isni; subsequently Tiflis seems to have been known as Sāidābād, Kal'a as Tiflis, and Isni as Aulabār. Kal'a and Isni possessed citadels; that of the former contained the church of St Nicholas and a royal palace; that of the latter the church of the Holy Virgin and the residence of the archimandrite. The town is now divided into quarters: the Russian (the finest of all), the German, the Armenian, and that in which are congregated Jews, Mahommedans and the mass of Orientals.

The Georgian annals put the foundation of Tiflis back to A.D. 379. In the later half of the 5th century the chieftain of Georgia, Wakhtang, Gurgaslan, transferred his capital from Mtskhet to the warm springs of Tphilis, where he erected several churches and a fort. In 570 the Persians took the place and made it the residence of their rulers, but retained it only for ten years. Tiflis suffered successive plunderings and devastations at the hands of the Greeks in 626, of one of the commanders of the Caliph Omar in 731, of the Khazars in 828, and of the Arabs in 851. The Georgians, however, always managed to return to it and to keep it in their permanent possession. In the course of the succeeding centuries Tiflis fell repeatedly into Persian hands; and it was plundered by the Mongol conqueror Tamerlane towards the end of the 14th century. Afterwards the Turks seized it several times, and towards the end of the 17th century the Lesghians attacked it. In 1795, when the shah of Persia plundered Tiflis, Russia sent troops to its protection, and the Russian occupation became permanent in 1799.

Perhaps one of the fullest accounts of Tiflis is contained in Brosset's edition of the *Description géographique de la Géorgie* (St Petersburg, 1842), by the illegitimate son of Wakhtang VI., king of Karthli (*i.e.* Georgia), who became a pensioner of Peter the Great. (P. A. K.; J. T. Be.)

TIGELLINUS, SOPHONIUS, minister and favourite of the emperor Nero, was a native of Agrigentum, of humble origin and possibly of Greek descent. During the reign of Caligula he was banished (A.D. 39) for adultery with the emperor's sisters, but recalled by Claudius (41). Having inherited a fortune, he bought land in Apulia and Calabria and devoted himself to breeding race-horses. In this manner he gained the favour of Nero, whom he aided and abetted in his vices and cruelties. In 62 he was promoted to the prefecture of the praetorian guards. In 64 he made himself notorious for the orgies arranged by him in the Basin of Agrippa, and was suspected of incendiarism in connexion with the great fire, which, after having subsided, broke out afresh in his Aemilian gardens. In 65, during the investigation into the abortive conspiracy of Piso, he and Poppaea formed a kind of imperial privy council. In 67 he accompanied Nero on his tour in Greece. When the emperor's downfall appeared imminent, Tigellinus deserted him, and with Nymphidius Sabinus brought about the defection of the praetorians. Under Galba he was obliged to give up his command, but managed to save his life by lavishing presents upon Vinius, the favourite of Galba, and his daughter. Otho on his accession (69) determined to remove one so universally detested by the people. While in the baths at Sinuessa, Tigellinus received the news that he must die, and, having vainly endeavoured to gain a respite, cut his throat.

See Tacitus, *Annals*, xiv., xv., xvi.; *Hist.* i. 72; Dio Cassius lix. 23, lxii. 13, 15, 27, lxiii. 12, 21, lxiv. 3; Suetonius, *Galba*, 15; Plutarch, *Galba*, *Otho*; ancient authorities quoted by Mayor on Juvenal, i. 155; B. W. Henderson, *Life and Principate of the Emperor Nero* (1903).

TIGER (*Felis tigris*), an animal only rivalled by the lion in size, strength and ferocity among the cat-like beasts of prey (see CARNIVORA). Almost everything that is stated in the article LION concerning the structure of the skeleton, teeth and claws of that animal will apply equally well to the tiger, the difference between the two lying mainly in the skin and its coverings. A tiger's skull may, however, always be distinguished from that

The Tiger (*Felis tigris*).

of a lion by the circumstance that the nasal bones extend higher on the forehead than the maxillae, instead of stopping on nearly the same line. Although examples of both species present considerable variations in size, it is ascertained that the length of the largest-sized Bengal tiger may exceed that of any lion. Much larger specimens are recorded, but 10 feet from the tip of the nose to the end of the tail is no unusual length for a large male tiger. The female is somewhat smaller and has a lighter and narrower head. The tiger has no mane, but in old males the hair on the cheeks is rather long and spreading. The ground-colour of the upper and outer parts of the head, body, limbs and tail is bright rufous fawn; and these parts are beautifully marked with transverse stripes of a dark, almost black colour. The markings vary much in different individuals, and even on the two sides of the same individual. The under-parts of the body, the inside of the limbs, the cheeks and a large spot over each eye are nearly white. The tigers which inhabit hotter regions, as Bengal and the south Asiatic islands, have shorter and smoother hair, and are more richly coloured and distinctly striped than those of northern China and Siberia, in which the fur is longer, softer and lighter-coloured. The Siberian tiger is *F. tigris mongolica*, and the Persian *F. tigris virgata*. Black and white phases have been recorded, but they are rare. The tiger is exclusively Asiatic, but has a very wide range in that continent, having been found in almost all suitable localities south of a line drawn from the river Euphrates, passing along the southern shores of the Caspian and Sea of Aral by Lake Baikal to the Sea of Okhotsk. Its most northern range is the territory of the Amur, its most southern the islands of Sumatra, Java and Bali. Westward it reaches to Turkish Georgia and eastward to the island of Saghalin. It is absent, however, from the great elevated plateau of Central Asia, nor does it inhabit Ceylon, Borneo or the other islands of the Indo-Malay Archipelago, except those named.

The principal food of the tiger in India is cattle, deer, wild hog and pea-fowl, and occasionally human beings. The regular "man-eater" is generally an old tiger whose vigour is past, and whose teeth are worn and defective; it takes up its abode in the neighbourhood of a village, the population of which it finds an easier prey than wild animals. Though chiefly affecting grassy plains or swamps, tigers are also found in forests, and seem to be fond of haunting the neighbourhood of old ruins. As a rule, they do not climb trees; but when pressed by fear, as during an inundation, they have been known to do so. They take to the water readily and are good swimmers. The tigers of the Sundarbans (Ganges delta) continually swim from one island to the other to change their hunting-grounds for deer. The following extract from Sir J. Fayrer's *Royal Tiger of Bengal* (1875) may complete this notice of the tiger's habits.

The tigress gives birth to from two to five, even six cubs; but three is a frequent number. She is a most affectionate and attached mother, and generally guards and trains her young with the most watchful solicitude. They remain with her until nearly full-grown, or about the second year, when they are able to kill for themselves and begin life on their own account. Whilst they remain with her she is peculiarly vicious and aggressive, defending them with the greatest courage and energy, and when robbed of them is terrible in her rage; but she has been known to desert them when pressed, and even to eat them when starved. As soon as they begin to require other food than her milk, she kills for them, teaching them to do so for themselves by practising on small animals, such as deer and young calves or pigs. At these times she is wanton and extravagant in her cruelty, killing apparently for the gratification of her ferocious and bloodthirsty nature, and perhaps to excite and instruct the young ones, and it is not until they are thoroughly capable of killing their own food that she separates from them. The young tigers are far more destructive than the old. They will kill three or four cows at a time, while the older and more experienced rarely kill more than one, and this at intervals of from three or four days to a week. For this purpose the tiger will leave its retreat in the dense jungle, proceed to the neighbourhood of a village or gowrie, where cattle feed, and during the night steal on and strike down a bullock, drag it into a secluded place, and then remain near the "murrie" or "kill," for several days, until it has eaten it, when it will proceed in search of a further supply, and, having found good hunting ground in the vicinity of a village or gowrie, continue its ravages, destroying one or two cows or buffaloes a week. It is very fond of the ordinary domestic cattle, which in the plains of India are generally weak, half-starved, undersized creatures. One of these is easily struck down and carried or dragged off. The smaller buffaloes are also easily disposed of; but the buffalo bulls, and especially the wild ones, are formidable antagonists, and have often been known to beat the tiger off, and even to wound him seriously. (W. H. F.; R. L.*)

TIGER-CAT, typically *Felis tigrina*, an American wild cat ranging from Mexico, on the east of the Andes to Paraguay and the central forest region of Argentina. Together the head and body measure something over 30 in., of which the tail counts for a third. The fur is grizzly grey, with black spots that do not form chains. The name is also applied to the Ocelot (*q.v.*), and often used of any small striped or spotted wild cat, either from the western or eastern hemisphere.

TIGER-FLOWER, known botanically as *Tigridia*, a genus of bulbous plants (natural order Iridaceae), natives of Mexico, Central America, Peru and Chile. They have long narrow plicately-veined leaves springing from the bulb and a stem bearing two or three scattered smaller leaves and above a few flowers emerging from a spathe. The flowers are spotted (whence the name tiger-flower or tiger-iris) and have free segments springing from a tube; the three large broad outer segments are concavely spreading, the three inner are much smaller and more erect. *T. pavonia* (Flower of Tigris) has large flowers with a golden orange, white or yellow ground colour.

TIGHE, MARY (1772–1810), Irish poet, daughter of the Rev. William Blachford, was born on the 9th of October 1772. In 1793 she contracted what proved to be an unhappy marriage with her cousin, Henry Tighe, of Woodstock, Co. Wicklow. She died on the 24th of March 1810, at Woodstock, Co. Kilkenny, and was buried at Inistioge. Mrs Tighe was the author of a poem of unusual merit, *Psyche or the Legend of Love*, printed privately in 1805 and published posthumously in 1811 with some other poems. It is founded on the story as told by Apuleius, and is written in the Spenserian stanza. The poem had many admirers, and high praise is awarded it in a contemporary notice in the *Quarterly Review* (May 1811).

TIGLATH-PILESER (Ass. *Tukulti-pal-E-sarra*, "my confidence is the son of E-sarra," *i.e.* the god In-Aristi), the name of several Assyrian kings. The numbering of these kings is not certain.

TIGLATH-PILESER I., the son of Assur-ris-isi, ascended the throne *c.* 1120 B.C., and was one of the greatest of Assyrian conquerors. His first campaign was against the Moschi who had occupied certain Assyrian districts on the Upper Euphrates; then he overran Commagene and eastern Cappadocia, and drove the Hittites from the Assyrian province of Subarti north-east of Malatia. In a subsequent campaign the Assyrian forces penetrated into the Kurdish mountains south of Lake Van and then turned westward, Malatia submitting to the invader. In his fifth year Tiglath-Pileser attacked Comana in Cappadocia, and placed a record of his victories engraved on copper plates in a fortress he built to secure his Cilician conquests. The Aramaeans of north Syria were the next to be attacked, and he thrice made his way as far as the sources of the Tigris. The command of the high road to the Mediterranean was secured by the possession of the Hittite town of Pethor at the junction of the Euphrates and Sajur, and at Arvad he received presents, including a crocodile, from the Egyptian king, and, embarking in a ship, killed a dolphin in the sea. He was passionately fond of the chase and was also a great builder, the restoration of the temple of Assur and Hadad at Assur (*q.v.*) being one of his works.

TIGLATH-PILESER II. or III., son of Hadad-nirari II., appears to have reigned from about 950 to 930 B.C., but nothing is known about him.

TIGLATH-PILESER III. or IV., was a successful general who usurped the Assyrian throne on the 13th of Iyyar 745 B.C., after the fall of the older dynasty, and changed his name of Pulu (Pul) to that of the famous conqueror of earlier times. In Babylonia, however, he continued to be known as Pulu. He was a man of great ability, both military and administrative, and initiated a new system of policy in Assyria which he aimed at making the head of a centralized empire, bound together by a bureaucracy who derived their power from the king. The empire was supported by a standing army and an elaborate system of finance. The first task of Tiglath-Pileser was to reduce the Aramaean tribes to order, and so win the gratitude of the Babylonian priests. Then he struck terror into the wild tribes on the eastern frontiers of the kingdom by a campaign which extended into the remotest parts of Media. Next came the defeat of a northern coalition headed by Sar-duris of Ararat, no fewer than 72,950 of the enemy being captured along with the city of Arpad, where the Assyrian king received the homage of various Syrian princes. Arpad revolted soon afterwards, but after a siege was taken in 740 B.C. The following year Azariah of Judah appears among the enemies of Tiglath-Pileser, who had overthrown his Hamathite allies and annexed the nineteen districts of Hamath. The conquered populations were now transported to distant parts of the empire. In 737 B.C. Tiglath-Pileser again marched into Media, and in 735 he invaded Ararat and wasted the country round the capital Van to a distance of 450 miles. In 734 B.C. he was called to the help of Yahu-khazi (Ahaz) of Judah, who had been attacked by Pekah of Israel and Rezon (Rasun) of Damascus. Rezon, defeated in battle, fled to his capital which was at once invested by the Assyrians, while with another portion of his army Tiglath-Pileser ravaged Syria and overran the kingdom of Samaria. Ammon, Moab, Edom and the queen of Sheba sent tribute, and Teima in northern Arabia was captured by the Assyrian troops. In 732 B.C. Damascus fell; Rezon was put to death, and an Assyrian satrap appointed in his stead. Tyre also was made tributary. The next year Tiglath-Pileser entered Babylonia, but it was not until 729 B.C. that the Chaldaean prince Ukin-zer (Chinzirus) was driven from Babylon and Tiglath-Pileser acknowledged as its legitimate ruler. In the early part of Tebet 727 B.C. he died, after having built two palaces, one at Nineveh, the other at Calah.

See P. Rost, *Die Keilschrifttexte Tiglat-Pilesers III.* (1893); also BABYLONIA AND ASSYRIA, § v. *History* ("Second Assyrian Empire"); and authorities quoted in § viii. *Chronology.*

TIGRANES, or DIKRAN, king of Armenia (*c.* 95–55 B.C.). Armenia had by the conquests of Alexander the Great become a province of the Macedonian Empire; but it was never thoroughly subjected to the foreign rule. A Persian family, that of Hydarnes, one of the associates of Darius Hystaspis, which possessed large domains in Armenia and had been invested with the satrapy for several generations, was dominant in the country, and assumed the royal title in defiance of the Seleucid. Antiochus III. the Great put an end to this dynasty about 211 and divided Armenia into two satrapies, which he gave to two generals of Persian origin, the district of Sophene in the west (on the Euphrates and the sources of the Tigris) to Zariadres, the eastern part, called Armenia Major (round the lake of Van) to Artaxias (see ARMENIA). After the battle of Magnesia (190) both made themselves independent; Artaxias conquered the valley of the Araxes, where he founded his new capital Artaxata (" town of Artaxias," said to be built by the advice of Hannibal, Strabo xi. 528; Plut. *Luc.* 31). He was defeated and taken prisoner by Antiochus IV. *Epiphanes* in 165 (Appian, *Syr.* 45, 66), but soon became independent again in the troubles which followed his death (cf. Diod. xxxi. 22, 27a); and his successors extended their power even farther against Media and the districts on the Kur. But from 140 the Parthians became the dominant power east of the Euphrates. King Artavasdes of Armenia was attacked by Mithradates II. the Great about 105 B.C. (Justin xlii. 2). He had to give his son Tigranes (b. 140 B.C. according to Lucian, *Macrob.* 15; by Appian, *Syr.* 48, he is called " son of Tigranes "; if that is correct, he probably was the nephew of Artavasdes) as hostage to the Parthians, and he obtained his freedom only by ceding seventy valleys bordering on Media (Strabo xi. 532; cf. xvi. 745; Justin xxxviii. 3). This sketch of the earlier history of Armenia is principally based upon the data given by Strabo xi. 528, 531 seq. The traditions preserved by the Armenian historians (who fancy that an Arsacid dynasty ruled over Armenia since the time of Alexander) have no historical value whatever.

Tigranes, who ascended the throne in 95 or 94 B.C. (Plut. *Luc.* 21), immediately began to enlarge his kingdom. He deposed Artanes, the last king of Sophene from the race of Zariadres (Strabo xi. 532), and entered into close alliance with Mithradates VI. Eupator of Pontus, whose daughter Cleopatra he married. In 93 he invaded Cappadocia in the interest of Mithradates, but was driven back by Sulla in 92 (Plut. *Sulla*, 5, Justin xxxviii. 3). During his first war with Rome, Mithradates was supported by Tigranes, although he abstained from interfering openly. But he meanwhile began war with the Parthians, whose empire was weakened after the death of Mithradates II. (about 88) by internal dissensions and invasions of the Scythians. Tigranes reconquered the valleys which he had ceded, and laid waste a great part of Media, down to Ecbatana (Isidor. Charac. 6), and the districts of Nineveh and Arbela; the kings of Atropatene, Gordyene (the country of the Carduchi, now Bohtan), Adiabene (the former Assyria) and Osroene (Edessa) became his vassals, who attended him like slaves wherever he went; northern Mesopotamia also was torn from the Parthian Empire (Strabo xi. 532, 747; Plut. *Luc.* 32). In 83 he invaded Syria, defeated the last successors of Seleucus and occupied Cilicia, of which the eastern parts still belonged to the Seleucids (Justin xl. 1; Appian, *Syr.* 48; Plut. *Luc.* 14, 21). In the war between Mithradates and Sulla he did not interfere, but after the death of Sulla (78) he occupied Cappadocia again and expelled King Ariobarzanes I., the vassal of the Romans (Appian, *Mithr.* 67; Strabo xii. 539). During the next years wars are mentioned in Syria, where the princess Cleopatra Selene attempted in vain to restore the Seleucid rule, but was besieged in Acco and afterwards killed (Joseph. *Ant.* xiii. 16, 4; Strabo xvi. 749), and in Cilicia, where he destroyed the Greek town of Soli (Plut. *Pomp.* 28; Dio Cass. xxxvi. 37). Tigranes now had become "king of kings" and the mightiest monarch of Asia. So he built a new royal city, Tigranocerta, on the borders of Armenia and Mesopotamia, between Mt Masius and the Tigris, where he accumulated all his wealth and to which he transplanted the inhabitants of twelve Greek towns of Cappadocia, Cilicia and Syria (Plut. *Luc.* 21, 26; Appian, *Mithr.* 67; Strabo xi. 522, 532, 539; Plin. vi. 26 seq.; for the situation, which is much disputed, cf. Tac. *Ann.* xiv. 24, xv. 5, ed. Furneaux). He also transplanted many Arabic tribes into Mesopotamia (Plut. *Luc.* 21; Plin. vi. 142). But the Romans could not tolerate encroachment upon their sphere of power, and in 69 Lucullus invaded Armenia. Tigranes was beaten at Tigranocerta on the 6th of October 69, and again near Artaxata in September 68. The recall of Lucullus gave some respite to the two kings, who even invaded Asia Minor again. But meanwhile a son of Tigranes and Cleopatra, called Tigranes, like his father, rebelled against him (as the old man had already killed two of his sons, he had reason enough to be afraid for his life) and found refuge with the Parthian king Phraates III., whose daughter he married and who sent him back with an army (Appian, *Mithr.* 104; Plut. *Pomp.* 33; Dio Cass. xxxvi. 51). The old king now gave up all hope of resistance; he put a price on the head of Mithradates, and when Pompey advanced into Armenia and united with the younger Tigranes, he surrendered himself to the Roman general (66 B.C.). Pompey now changed his policy; he received the old Tigranes graciously and gave him back his diadem, while he treated the son very coolly and soon made him prisoner. The younger Tigranes was led in triumph into Rome, where he found his death when he tried to escape from his confinement by the intrigues of P. Clodius in 58 (Dio Cass. 38, 30). The father after his defeat ruled about ten years longer over Armenia, as vassal of the Romans. He died about 56, and was succeeded by his son Artavasdes. (See also MITHRADATES.) (ED. M.)

TIGRÉ, a northern province of Abyssinia; one of the three principal divisions of the country, the others being Amhara or Gondar in the centre and Shoa in the south. The *ras* (or prince) of Tigré has been often a more powerful potentate than the nominal emperor. Tigré contains the town of Axum (*q.v.*), capital of the ancient Ethiopic Empire. Adua (Adowa, *q.v.*) is the capital of the province. (See ABYSSINIA.)

Tigrina, the dialect spoken in Tigré and Lasta, is nearer the ancient Geez than is Amharic, the official and more widely diffused language of Abyssinia. See J. Schreiber, *Manuel de la langue tigrai* (Vienna, 1887–1893); and L. de Vito, *Grammatica della lingua tigrigna* (Rome, 1895).

TIGRIS (Old Persian *Tigrā*, *Diklat* of the cuneiform inscriptions, *Hiddekel* of the Old Testament, *Diglath* of the Targum, *Digla* of the Arabs), a great river of western Asia, rising from two principal sources. The more western of these is about 10 m. S. of Lake Geuljik (Colchis of the ancients), at an altitude of 5050 ft., some 2 or 3 m. only from the channel of the Euphrates, which here forms a peninsula by a great bend (38° 10′ N., approximately 39° 20′ E.). The eastern source, which joins the main stream at Til (37° 45′ N., 41° 46′ E.), is itself divided into two branches, or rather it may be said to consist of a network of small streams, the most northerly of which has its origin in about 38° 40′ N. to the west of Lake Van, and close to the headwaters of the Murad Su, the eastern branch of the Euphrates, while the most easterly point is situated in a region about 42° 50′ E., southward of the same lake. The two sources together drain the region south as the Euphrates drains the region north of the Taurus mountains. After the junction of the two branches the river pursues a winding course, generally south-east, for about 800 m. to the point of union with the Euphrates at Garmat Ali, whence it is known as the Shatt-el-Arab until it empties into the Persian Gulf some 70 m. lower down. For some five or six centuries before 1908–1909 the junction with the Euphrates was at Korna, some 30 m. above Garmat Ali. On the western side there are no tributaries at the present day. As late as A.D. 1200, however, the Arabian geographers mention a tributary, the Tharthar, navigable in flood time, which flowed from the Jaghigagh branch of the Khabur, a tributary of the Euphrates, to the Tigris. Ormsby, in 1832, also reported a river, the Asās Amir, as coming down from the Sinjar hills and joining the Tigris near Kal-'at Shergat, about 35° 30′ N.; but this seems now to be a dry bed. On the eastern side of the river, on the other hand, there are several important tributaries descending from the Persian mountains: the Khabur, a little north of 37° N., navigable for rafts; the Great Zab, at 36° N., just below Nimrud, the ancient Calah; the Little Zab, about 35° 15′ N.; the 'Adhem at 34° N. and the very large and important Diyala, a little below Bagdad, at 33° 15′ N.

The course of the Tigris is much shorter than that of the Euphrates, about 1150 m. as compared with 1800 m., but its volume of water is greater, at least in its lower course. At Bagdad it has an average breadth of about 200 yards and a current in flood time of about 4½ m. per hour. It is navigable for steamers to a point a little above the mouth of the Great Zab, about 30 m. south of Mosul, at which point navigation is blocked by two ancient dams, erected, apparently, to control the river for the Assyrian city of Calah, the ruins of which are called Nimrud by the natives after these dams, which they conceive to be the work of that mythical hero. Were it not for these dams steamers might reach Mosul itself, at an elevation of 353 ft. above the Persian Gulf. Two lines of steamers, an English and a Turkish, furnish an inadequate service between Basra and Bagdad, but there is no steam navigation on the river above the latter city. Small sailing craft navigate upwards as far as Samārra; above this all navigation is downward, and by raft. For rafts the river is navigable from Diarbekr and is termed by the natives "the cheap cameleer." The rafts used are the so-called *kelleks*, of wood supported on inflated skins, which are broken up at Bagdad, the wood sold and the skins carried back by caravan.

Near the source of the Tigris, at Arghana-Ma'den, are copper mines. In the neighbourhood of Diarbekr is iron. Below Mosul, for some distance, occur sulphurous and bituminous springs. There are also in that neighbourhood famous marble quarries. This part of the river's course, the ancient Assyria, is also a rich agricultural region.

From a little above the confluence of the Great Zab downward, the banks of the river are absolutely uninhabited, and the river flows through a desert until Tekrit is reached. Beginning shortly below Tekrit there are indications of considerable canalization, both for the purpose of irrigating country remote from the river, and also of shortening the course of the river for navigation. In ancient times the country on both sides of the river was well irrigated below this point, the waters of the Tigris were under thorough control, and it and its lower tributaries, the 'Adhem and the Diyala, were made, by means of huge canals, to furnish great water-ways for the country between it and the Persian hills eastward. Of these canals the best known, and probably the greatest, was the Nahrawan, which, leaving the Tigris, on its eastern side, above Samārra, over 100 m. north of Bagdad, rejoined it below Kut-el-Amara, an equal distance to the south. None of these canals is serviceable at the present time, and few carry water in any part of their course, even in flood time.

A little south of Samārra the stony plateau of Mesopotamia ends, and the alluvial plain of Irak, ancient Babylonia, begins. Here the palm groves begin also, and from this point to a little beyond Bagdad the shores of the river are well cultivated. At the point of entering the alluvial plain the bed of the Tigris seems to be lower than that of the Euphrates, so that the canals run from the latter to the former stream. At Bagdad the Tigris and Euphrates are less than 35 m. apart, then they recede again, the Tigris bending eastward, until, below the Shatt-el-Haī, they are separated by almost 100 m. From Bagdad downward, the course of the Tigris is peculiarly serpentine and shifting. The mud brought down by it, calculated at 7150 lb an hour at Bagdad, is not deposited in marshes to form alluvium, as in the case of the Euphrates, but although in flood time the river becomes at places an inland sea, rendering navigation extremely difficult and uncertain, the bulk of the mud is deposited in banks, shoals and islands in the bed of the river, and is finally carried out into the Persian Gulf. At Kut-el-Amara, approximately half way from Bagdad to Korna, the bed of the Tigris is higher than that of the Euphrates, and accordingly from this point downward, its waters flow into the Euphrates and not vice versa.

Shortly below Kut-el-Amara all traces of ancient canalization on the east side vanish, and it would appear as though much of that region, now largely under water at flood time, constituted an inland sea. On the west side, however, there are the remains of several canals or channels, some still carrying water, one of which, the Shatt-el-Haī, leaving the Tigris at Kut-el-Amara, and emptying into the Euphrates at Nasrieh, is still navigable. Indeed, in the time of the caliphate this was the channel of the Tigris, and on its banks stood the important city of Wasit. At a much more remote period also the great city of Lagash stood by or on its banks. In the time of the Sassanian kings, however, as at the present time, the Tigris occupied a more easterly course. Indeed, the lower course of the Tigris, even more than that of the Euphrates, has always been subject to change. Below the Shatt-el-Haī the country on both sides of the river is practically a swamp, except where the palm groves have formed land.

The Tigris begins to rise about the middle of November and is highest in May and June, and lowest in September and October. The principal towns on its banks are Diarbekr (anc. *Amida*), on the western branch; Bitlis, on the eastern branch; Mosul; Tekrit, a town dating from Persian days, said to have been founded by Shapur I. son of Ardashir I., formerly important, but now relatively insignificant; Samārra, also called Samira, the capital of the caliphate from A.D. 836 to 892, a place of pilgrimage of the Shia Moslems, containing magnificent tombs of two of their *Imams* the tenth and eleventh, with another much venerated shrine of the twelfth, as well as some interesting ruins; and Bagdad. While the Tigris never played the same rôle historically as the Euphrates, numerous remains of antiquity are to be seen along its course. Cuneiform inscriptions and bas-reliefs have been found at the sources of both the western and eastern Tigris, as well as at various points on the cliffs along the upper course of both branches. Opposite Mosul are the ruins of ancient Nineveh, the last capital of Assyria, and 20 m. below that the ruins of Calah, the second capital; while 35 m. farther south, on the opposite bank, lies Kal'at-Shergat, the ancient Assur, the original name-place and capital of the Assyrian Empire. A little south of Samārra are found remains of the Median Wall, which stretched south-west towards the Euphrates near Sahlawych, marking the edge of the Babylonian alluvial plain. In this neighbourhood also stood the ancient Opis. At Bagdad, besides the memorials of the caliphate, may be seen a few remains of the old Babylonian city of Bagdadu, and a dozen miles southward, on the east bank of the river, stands Takhti-Khesra, the royal palace at Ctesiphon, the most conspicuous and picturesque ruin in all Babylonia, opposite which, on the other side of the river, are the low ruin mounds of ancient Seleucia.

TILBURG, a town in the province of north Brabant, Holland, and a junction station 13½ m. by rail E. by S. of Breda. A steam tramway connects it northwards with Waalwijk. Pop. (1905), 46,517. Tilburg has risen into importance since the separation of Belgium from Holland as one of the chief industrial centres of the south. It has Roman Catholic and Protestant churches, a synagogue, a cloth hall, a higher-burgher school, an art and music school, and a Roman Catholic seminary. The woollen manufacture is the chief industry, besides which there are leather, soap, oil and tobacco factories, as well as breweries, tanneries and iron foundries.

TILBURY DOCKS, on the north shore of the Thames, in the county of Essex, England. They lie opposite Gravesend 25 m. below London Bridge and about the same distance from the Nore, being thus within the port of London. They were constructed in 1886 by the East & West India Docks Company, and were later owned by the London & India Docks Company. The docks are four in number, having, with tidal basin and entrance locks, a total area of 74 acres. The depth of water in the tidal basin is 25 ft. at low tide and 44 ft. at high tide. The length of quayage is about 2½ m., and there is extensive warehousing as well as accommodation for passengers, as the largest passenger steamers trading with the Port of London lie here. Railway communication is provided by the London, Tilbury & Southend line, and there is direct connexion for goods traffic with all the northern lines.

TILDEN, SAMUEL JONES (1814–1886), American statesman, was born at New Lebanon, New York, on the 9th of February 1814. In 1834 he entered Yale University, but soon withdrew on account of ill health, and later studied in the University of the City of New York. He was admitted to the bar in 1841, and rose rapidly to the front rank. In the financial troubles between 1850 and 1860 it is said that more than half the railways north of the Ohio river and between the Hudson and the Missouri rivers were at some time his clients. In spite of his activity at the bar, Tilden maintained an interest in politics, serving in the State Assembly in 1846 and in the state constitutional conventions of 1846 and 1867. In 1848, largely on account of his personal attachment to Martin Van Buren, he participated in the revolt of the "Barnburner" or free-soil faction of the New York Democrats, and in 1855 was the candidate of the "softshell," or anti-slavery, faction for attorney-general of the state. During the Civil War, although he opposed several of the war measures of President Lincoln's administration, he gave the Union cause his heartiest support. In 1866 Tilden became chairman of the Democratic state committee, and soon came into conflict with the notorious "Tweed ring" of New York City. As the "ring" could be destroyed only by removing the corrupt judges who were its tools, Tilden, after entering the Assembly in 1872 to promote the cause of reform, took a leading part in their impeachment. By analysing the bank accounts of certain members of the "ring," he obtained legal proof of the principle on which the spoils had been divided. His fame as a reformer brought him to the governor's chair in 1874, and he at once gave his attention to a second set of plunderers—the "canal ring," made up of members of both parties who had been systematically robbing the state through the maladministration of its canals—and succeeded in breaking them up. In 1876 the Democrats nominated him for the presidency, the Republicans nominating Rutherford B. Hayes of Ohio. The result was the disputed election of 1876, when two sets of returns were sent to Washington from the states of Florida, Louisiana, South Carolina and Oregon. As the Federal Constitution contained no provision for settling a dispute of this kind the two houses of Congress agreed to the appointment of an extra-constitutional body, the "Electoral Commission" (*q.v.*) which decided all the contests in favour of the Republican candidates. Tilden counselled his followers to abide quietly by the result. In 1878 the New York *Tribune* (Republican) published a series of telegraphic despatches in cipher, accompanied by translations, by which it attempted to prove that during the crisis following the election Tilden had been negotiating for the purchase of the electoral votes of South Carolina and Florida. Tilden denied emphatically all knowledge of such despatches, and appeared voluntarily before a Congressional sub-committee in New York City to clear himself of the charge. The attempts to implicate him in corrupt transactions were not successful; but his political opponents endeavoured to make capital in subsequent campaigns, out of the "Cipher Dispatches." The remainder of his life was spent in retirement at his country home, Greystone, near Yonkers, New York, where he died on the 4th of August 1886. Of his fortune (estimated at $5,000,000) approximately $4,000,000 was bequeathed for the establishment and maintenance of "a free public library and reading-room in the City of New York"; but, as the will was successfully contested by relatives, only about $2,000,000 of the bequest was applied to its original purpose; in 1895 the Tilden Trust was combined with the Astor and Lenox libraries to form the New York Public Library.

Tilden* (2 vols., New York, 1908), both edited by John Bigelow; also Bigelow's *Life of Samuel J. Tilden* (2 vols., New York, 1895); and P. L. Haworth's *The Hayes-Tilden Disputed Presidential Election of 1876* (Cleveland, 1906).

TILE (O. Eng. *tigel*, Fr. *tuile*, connected with Lat. *tegula*), the name given to flat slabs of baked clay or other material used for a great variety of architectural purposes, such as covering roofs, floors and walls.

1. *Roofing Tiles.*[1]—In the most important temples of ancient Greece the roof was covered with tiles of white marble, fitted together in the most perfect way so as to exclude the rain. In most cases as in the Athenian Parthenon and the existing temple of Aegina the tiles were large slabs of marble, with a flange along each side over which joint tiles (ἁρμοί) were accurately fitted (see A. in fig. 1). In the temple of Apollo at Bassae, though the main building was of limestone, the roof was covered with very beautiful tiles of Parian marble, which are specially mentioned by Pausanias as being one of the chief beauties of the temple. Some of these were found by Mr Cockerell during his excavations at Bassae early in the 19th century.[2] In design they resemble the other examples mentioned above, but are peculiar in having a joint piece worked out of the same slab of marble as the adjacent tiles (see B in fig. 1) at great additional cost of material and labour, in order to secure a more perfect fit. Fig. 2 shows the way in which they were set on the roof. Great splendour of effect must have been gained by continuing the gleaming white of the columns and walls on to the roof. All along the eaves each end of a row of joint tiles was usually covered by an antefixa, an oval topped piece of marble with honeysuckle or some other conventional pattern carved in relief.[3] In most cases the Greeks used terra-cotta roofing tiles, shaped like the marble ones of fig. 1, A. Others were without a flange, being formed by a concave upper surface to prevent the rain getting underneath the joint tiles. The lower edge of the tile, whether of marble or of clay, was usually half-lapped and fitted into a corresponding rebate in the upper edge of the next tile (see D in fig. 1). The ἁρμοί also were half-lapped at the joints (see E in fig. 1). All these were usually fastened with bronze nails to the rafters of the roof. In some cases each joint-tile had a projecting peg to fix it to the next ἁρμός, as shown at F. In the temples of Imperial Rome marble roofing tiles were used like those shown at fig. 1. These were copied from Greek work along with other salient architectural features. For domestic and other less important work clay tiles (*tegulae*) were employed, of the form shown in A, fig. 3. These are narrower at the lower edge, so as to fit into the upper

[1] In Egypt and Assyria temples and palaces were mostly roofed with stone, while inferior buildings had flat roofs covered with beaten clay (see also TERRA COTTA).

[2] See Cockerell, *Temples of Aegina and Bassae* (London, 1860).

[3] Marble tiles are said to have been first made by Byzes of Naxos about 620 B.C.; see Pausanias v. 10, 2.

edge of the next tile and the joints were covered with a semicircular joint tile (imbrex). Rows of terra-cotta antefixae were set along the eaves of the roof, and were often moulded with very beautiful reliefs. In localities which supply laminated stone, such as Gloucestershire and Hampshire in Britain, the Romans often roofed their buildings with stone tiles fastened

with iron nails. Fig. 3, B, shows an example from a Roman villa at Fifehead Neville, in Dorset, England. Each slab had a lap of about 2″ over the row of tiles below it; many large iron nails were found with these stone tiles.

In a few cases, in the most magnificent temples of ancient Rome, as in those of Capitoline Jupiter and of Venus and Rome, and also the small circular temple of Vesta[1] tiles of thickly gilded bronze were used, which must have had a most magnificent effect. Those of the last named building are specially mentioned by Pliny (*H.N.* xxxiv. 7) as having been made of Syracusan bronze[2]—an alloy in great repute among the Romans. The bronze tiles from the temples of Jupiter Capitolinus and of Venus and Rome were taken by Pope Honorius I. (625–638) to cover the basilica of St Peter, whence they were stolen by the Saracens during their invasion of the Leonine city in 846.[3]

In medieval times lead or copper[4] in large sheets was used for the chief churches and palaces of Europe; but in more ordinary work clay tiles of very simple form were employed. One variety, still very common in Italy, is shown in C, fig. 3. In this form of so-called "pan-tile" each tile has a double curve, forming a *tegula* and *imbrex* both in one. Stone tiles were also very common throughout the middle ages. Another kind of roofing tile, largely used in pre-Norman times, and for some centuries later for certain purposes, was made of thin pieces of split wood, generally oak; these are called "shingles." They stand the weather fairly well, and many old examples still exist, especially on the wooden towers and spires of East Anglia.

At the present day, when slate is not used, tiles of burnt clay are the ordinary roofing material, and many complicated forms have been invented to exclude rain. Most of these are, however, costly and do not answer better than the rectangular tile about 9 by 6 in., fastened with two copper or even stout zinc nails, and well bedded on mortar mixed with hair. For additional security clay tiles are usually made with two small projections at the upper edge, which hook on to the battens to which they are nailed. The district round Broseley (Shropshire) is one of the chief centres in England for the manufacture of roofing tiles of the better sort. The common kinds are made wherever good brick-clay exists. In some places pan-tiles are still used and have a very picturesque effect; but they are liable to let in the rain, as they cannot be securely nailed or well bedded in mortar. In Gloucestershire, Yorkshire, north-east Lancashire and other counties of England, stone tiles are still employed, but are rapidly going out of use, as they require very strong roof timbers to support them, and the great extension of railways has made the common purple slates cheap in nearly every district. The green slates of the Lake District are now extensively used for this purpose, often with excellent effect.

Some of the mosques and palaces of Persia are roofed with the most magnificent, enamelled, lustred tiles, decorated with elaborate painting, so that they shine like gold in the sun. They were specially used from the 13th century to the 15th. In style and manufacture the finest of them resemble the frieze shown in fig. 5.

2. *Wall Tiles.*—These are partly described under MURAL DECORATION (*q.v.*).[5] In most oriental countries tiles were used in the most magnificent way throughout the middle ages especially in Constantinople, Broussa, Damascus, Cairo, Moorish Spain, and in the chief towns of Persia. Fig. 4 shows a fine example from a mosque in Damascus. From the 12th to the 16th century a special kind of lustred tiles was largely employed for dadoes, friezes and other wall surfaces, being frequently made in large slabs, modelled boldly in relief with sentences from sacred books or the names and dates of reigning caliphs. The whole was picked out in colour, usually dark or turquoise blue, on a ground of cream-white enamel, and in the last firing minute ornaments in copper lustre were added over the whole design, giving the utmost splendour of effect (see fig. 5). Great skill and taste are shown by the way in which the delicate painted enrichments are made to contrast with the bold decoration in relief. These lustred tiles sometimes line the prayer-niche in houses and mosques; in such cases the slabs usually have a conventional representation of the kaaba at Mecca, with a lamp hanging in front of it and a border of sentences from the Koran.[6] The mosques of Persia are specially rich in this method of decoration,

FIG. 4.—Wall Tiles from Damascus, of the 16th century.

FIG. 5.—Persian Lustred Tiles of the 13th century, forming part of a frieze.

[1] The dome of the Pantheon was covered with tiles or plates of bronze thickly gilt, as were also the roofs of the forum of Trajan.

[2] Bronze tiles for small buildings such as this were usually of a pointed oval form, something like the feathers of a bird. This kind of tiling is called *pavonaceum* by Pliny, *H.N.*, xxxvi. 22.

[3] Part of the bronze tiles had been stripped from the temple of Jupiter by the Vandals in 455; see Procopius, *Bell. Van.* i. 5.

[4] The gilt domes of Moscow are examples of this use of copper. See also the domed churches at Rotterdam, Amsterdam, Hamburg and Lübeck.

[5] For the enamelled wall tiles of ancient Egypt, see CERAMICS.

[6] The Victoria and Albert Museum, London, contains many fine examples of the early as well as of the later sorts, like those shown in fig. 4.

magnificent examples existing at Natenz, Seljuk, Tabriz, Isfahan and other places.[1] Indian tile-work is specially described in the article KASHI.

Stamped Spanish tile decoration in its earliest form was an imitation of mosaic, pieces of enamelled tile of various colours being arranged in geometrical patterns, or combined with glass or stone for the purpose. In the 14th and 15th centuries this process was supplanted by one in which the variously shaped and coloured sections of tile were separated by means of narrow bands of the same material, enamelled in white and disposed in various combinations of geometrical interlacing. Of this kind are the bulk of the Alhambra tiles. But the tediousness of the process gave rise, about 1450, to what is known as the *cuerda seca* (or "dry cord") method, in which narrow fillets at the edges of the separating interlacings were first stamped upon the tile itself and filled with clay and manganese; these being fired (thus forming a "dry cord" or line) formed shallow compartments which were in turn filled with coloured enamel, white being used for the interlacings themselves. The process was much in vogue in Andalusia and Castile until about 1550, when there arose the method *de cuenca* in which the parts of the design to receive different coloured enamels were stamped, slightly concave (*cuenca*—a bowl or socket), their edges alone being left in relief. This process lasted until about the commencement of the 18th century.

At Manises, Paterna and elsewhere in Valencia, soon after the middle of the 14th century there commenced an extensive production of white enamelled tiles painted with designs in blue (more rarely in lustre and manganese) for wall and pavement decoration. This manufacture continued throughout the 15th century and produced some of the finest freehand tile designs that are known to-day. The motives included figure compositions, animals, plants, coats of arms, &c., drawn with great skill and facility. Most of these tiles are to be found in old houses in the city and province of Valencia.

In Catalonia, in the 16th century, blue and white painted tiles were produced in imitation of those of Valencia. For the most highly finished of these stencils were employed to block out the designs.

Polychrome painting upon tiles in the Italian manner was introduced into Spain by Niculose Francisco of Pisa, who settled at Seville (1503–1508) and executed altar-pieces and architectural details in tile work. This imported Italian style was much affected for armorial decoration.

In the 16th and 17th centuries tiles of a coarse kind of majolica were used for wall decoration in southern Spain; some rich examples still exist in Seville. These were the work of Italian potters who had settled in Spain.

3. *Floor Tiles.*—After the development of painted and lustred tiles in Spain and Italy for the decoration of wall surfaces, they were also introduced, during the latter part of the 15th and the first part of the 16th centuries, as pavements, especially in the chapels of the famous cathedrals of those countries. Comparatively few examples of these pavements now exist, as the majolica enamel was too soft to stand the wear of the feet of worshippers. The earliest known pavement of this type is that in the church of San Giovannia Carbonara in Naples, which is dated, approximately, 1440. The tiles, square and hexagonal in shape, are coated with white enamel and are painted chiefly in dark blue, with touches of green and purple. The British Museum, the Louvre and other museums have secured odd examples of these tiles. It seems probable from the technical methods of the work that it was produced by a Spanish or even a Moorish hand. It is well known that Moorish tile-makers did travel both into Italy and into France to embellish the palaces of great nobles or the chapels they founded. There is the well-known instance of the Moorish potter, Jean de Valence, who, in 1384, was brought to France by Jean de Berry to make tiles for the adornment of his ducal palace at Poitiers. One of the most important of these early majolica pavements is that made for the Convent of San Paulo at Parma, now in the museum of that town, which was probably laid down in 1482. One of the south chapels in the church of S. Maria del Popolo in Rome has a very fine pavement of painted tiles, executed probably at Forli, about 1480, for Cardinal della Rovere (Julius II.), whose arms—an oak tree—are repeated over and over again among the rich decorations. A still more magnificent tile floor, in the uppermost of Raphael's Vatican *loggie*, is mentioned in the article DELLA ROBBIA, where also are described the exquisite, enamelled tiles which Luca della Robbia made as a border for the tomb of Bishop Federighi at Fiesole near Florence. Fine examples of tile pavements of 1486 exist in the basilica of S. Petronio at Bologna. The chapel of St Catherine at Siena and the church of S. Sebastiano at Venice have majolica pavements of about 1510. Fig. 6 shows an example of about this date from

(Victoria and Albert Museum.)
FIG. 6.—Majolica Paving Tiles from Siena, made in 1509.

the Petrucci Palace in Siena, now in the Victoria and Albert Museum. In the early part of the 16th century majolica tiles from Spain were occasionally imported into England. At the south-east of the mayor's chapel at Bristol there exists, though much worn, a fine pavement of Spanish tiles dating from about 1520. Others have been found in London, at Newington Butts, and in other places.

Long before the southern nations of Europe were introducing their painted majolica tile pavements, a much more practical type of flooring tile was in use in Germany, France and England; of these the English encaustic tile pavements, dating from the early years of the 13th century to the end of the 16th century, are particularly important and beautiful. These Northern peoples had no knowledge of enamels and colours such as was possessed by the contemporary tile-makers of Moorish Spain or of Italy, and they were confined to the native red-brick earths and white pipeclays for their materials. The method of decoration was as simple and homely as the materials. Slabs of ordinary red-brick clay freed from pebbles, but not from grit or sand, were shaped by pressing cakes of clay into a mould of wood or baked clay, carved in such fashion that when the clay was just hard and dry enough to be removed from the mould the important elements of the design were formed as sunk cells divided by broad raised outlines. While this red tile was still soft and plastic, a thickish paste of pipeclay or other light burning clay was poured into the cells and allowed to stiffen.

[1] See Coste, *Monuments de la Perse* (Paris, 1867).

When the whole had dried sufficiently the surface was scraped level, with a thin sharp tool, with the result that the tile appeared with a kind of cloisonné design, the cloisons or boundaries of the cells being, of course, the upstanding ridges of the moulded red tile.[1] Over the surface of the tile finely powdered galena (native sulphide of lead) was freely dusted, and the whole was fired at one operation with the resulting production of a tile or tiles bearing a yellowish white pattern relieved against red or chocolate, and glazed with a natural lead glaze, which was much harder and better adapted to resist wear than the majolica glazes of Spain or Italy. The origin of this type of pavement tile is still obscure; one idea is that they were a development of the Roman Mosaic pavement, for, in examples discovered at Fountains Abbey and at Prior Crauden's Chapel, Ely, in which the tiles were of great variety of form and size, and, instead of the patterns being wholly inlaid in the tiles themselves, the design is, to a large extent, produced by the outlines of the individual pieces, which, in the later examples, are cut to the forms required to be represented, including the subject of the "Temptation of Adam and Eve," trees, lions, &c., the tesserae being also enriched with what may be more strictly called encaustic decoration. The more probable origin of this method of work seems, however, to be a development of the pavement tiles with simple incised designs which were made in the northern parts of Burgundy, in the Rhine Valley and in Flanders. Most interesting examples of these incised tiles are to be found in the cathedral of St Omer, which are known to be of the 12th century, and it seems impossible to resist the conclusion that such incised work forms the starting-point of the English encaustic tile-makers. A similar piece of work exists in Canterbury Cathedral, where we have stone tiles engraved with pictorial designs, the sunk parts being filled with a dark cement—this pavement also belongs to the 12th century.

Four styles of decoration are found on medieval Gothic tiles (1) incised or impressed, (2) raised, (3) inlaid, (4) slip-painted. It is to the third of these groups—the inlaid—that the name of "encaustic" tiles had been particularly given. The manufacture of medieval Gothic tiles was apparently the secret of certain religious houses in England, belonging either to the Benedictine or the Cistercian Orders. The earliest date at which we have tangible proof of the existence of this art is 1237, in which year it was ordered that the king's little chapel at Westminster should be paved with "painted tile": "mandatum est etc., quod Parvum capellam apud Westm. tegula picta decenter paveari faciatis," Rot. Claus. 22, Henry III. M. 19, A.D. 1237-38. In 1840 the removal of a wooden floor in the chapter-house at Westminster, exposed to view a tile pavement in good preservation which, though it can hardly be the pavement in question, is evidently of contemporary manufacture.

The finest and most artistic of these early English tiles were those found in Chertsey Abbey in Surrey. They were found in a very fragmentary condition on the Abbey site, but have been to a great extent pieced together by Mr Shurlock. Practically all the tiles that have been recovered are now in the British Museum (a number of them were formerly in the architectural museum at Westminster). They present a remarkable series of illustrations from the English romance of Sir Tristram and of events in the history of Richard Cœur-de-Lion (see Hobson's *Catalogue of English Pottery in the British Museum*, pl. ii.). Mention should also be made of the tile pavement discovered at the abbey of Halesowen in south Staffordshire. Many of these tiles are of very similar design to those of Chertsey, while some appear to have been made from the same moulds. From the evidence of inscriptions it would appear that this pavement was laid down in the latter part of the 13th century.

Combinations of tiles forming a cross were frequently used as mortuary slabs; an example is in Worcester Cathedral *in situ*, whilst detached component tiles of similar slabs are to be found in other ancient churches.

[1] It is interesting to note the similarity of technique between the English encaustic tiles, and the later methods of Hispano-Moorish work. The English filled their cells in the surface of the tiles with another clay, the Spanish-Moorish potters with coloured glaze.

Encaustic tiles are almost exclusively used for pavements, but an interesting instance of their employment for wall decoration occurs in the Abbey Church of Great Malvern, where these tiles have probably been originally used to form a reredos, and bear designs representing Gothic architecture in perspective, have introduced into them the sacred monogram "I.H.S.," the crowned monogram of "Maria," the symbols of the Passion, the Royal Arms and other devices. This example is also interesting as bearing the date of its manufacture on the margin "Anno R.R. H.VI. XXXVJ.," that is the thirty-sixth year of the reign of Henry VI. (1457–1458).

Kilns for tile-burning have been found at Bawsey, near Lynn, Norfolk; Malvern, containing some 15th-century tiles; Repton; Farringdon Street, London; and Great Saredon, in Staffordshire, with tiles of the 16th century.

Oldham, *Ancient Irish Pavement Tiles*; Frank Renaud, "The Uses and Teachings of Ancient Encaustic Tiles" (*Trans. Lancashire and Cheshire Antiquarian Society*, vol. ix.); W. W. Pocock's article in *The Surrey Archaeological Collections* (1885); J. R. Holiday on "Halesowen," in *Transactions of the Birmingham and Midland Institute* (1871); Manwaring Shurlock, *Tiles from Chertsey Abbey* (1885); Major Heales, F.S.A., *The Chertsey Tiles* (1880); W. Burgess, in *The Builder* (July 24, 1858).

With the downfall of the monasteries in the reign of Henry VIII. the making of encaustic tiles in England appears to have come to an end, and for nearly two centuries foreign tiles were imported from Germany, the Netherlands, Italy and Spain, or workmen from those countries must have practised their art here. There are in evidence the well-known green glazed tiles in the British Museum which, if made in England at all, are obviously inspired by contemporary German work, and the tiles used in the house of Sir Nicholas Bacon (*c.* 1509–1579) are obviously the work of an Italian majolist, whether they were made in Italy or in England. Increasing intercourse with the Netherlands brought into this country and, during the 17th century into the American colonies, the famous Delft tiles, painted either in blue, or in blue and manganese purple, on a tin enamel ground like that of the contemporary Delft pottery. From the 16th century onwards every country in Europe continued to makes tiles by methods strictly analogous with their contemporary pottery (see CERAMICS). Thus we have in Italy and Spain, throughout the 17th and 18th centuries, wall tiles in the style of the debased Italian majolica; in Germany a continuation of the ancient German stove tiles, either glazed with green, brown or black glaze, or bearing painted designs in the crude colours characteristic of the contemporary German pottery; in France there were, first, the painted tile pavements of Masseot Abaquesne of Rouen (1542–1557), and later the decorative tiles produced at Rouen, Nevers, Marseilles and elsewhere, always in the style of the current pottery of the same centres; and painted tiles for the decoration of fireplaces and for use as wall panels formed a considerable part of the output of the Dutch factories. Wherever imitations of Delftware were made, in England, Germany or the north of France, the manufacture of similar tiles naturally followed; and at Lambeth, Liverpool and Bristol, the chief centres of this industry in England, large quantities of tiles were made, especially during the 18th century. The tiles produced at Lambeth and Bristol factories were invariably painted after the manner of their Dutch prototypes, but during the latter half of the 18th century Liverpool became famous for its printed tiles, in which designs, mostly in black, transferred from engraved copper plates, took the place of hand-painting. Fine examples of all these 18th-century English tiles are to be found in the British Museum; the Guildhall Museum; the Victoria and Albert Museum, London; and in the museums at Liverpool and Bristol.

During the 17th and 18th centuries the old painted and decorated pavement tiles seemed to have been entirely replaced by the common buff or red terra-cotta "quarries" so largely used in farmhouse kitchens, dairies, &c., and it is to the painted tiles for walls and fireplaces that we have to look for the progress of the art.

The modern revival of tile-making in Europe dates from about 1830, when Samuel Wright, a potter of Shelton, near Stoke-upon-Trent, was granted a patent for the manufacture of tiles by mechanical means. His patent was extended for fourteen years, and in 1844 was purchased, in equal shares, by Herbert Minton—head of the famous firm of Mintons, of Stoke-upon-Trent—and Fleming St John, of Worcester. In 1848 the firm of Mintons acquired the sole right of the patent, and

FIG. 7.—A Panel of De Morgan's.

for many years Mintons were the most famous tile manufacturers in the world. In 1850 the firm of Maw & Co. purchased the remaining stock of encaustic tiles made at Worcester, and, on the expiration of Wright's patent, commenced to manufacture at the old works at Worcester, removing in 1851 to Benthall, Shropshire, and afterwards, about 1887, to their present works at Jackfield in the same district.

From the methods thus invented in England all the modern processes of tile-making have sprung. In some cases they resemble the old "plastic" method of encaustic tile-making as it was practised in England in the middle ages, except that the tile is finally pressed in a mechanical press.

The tile-makers of this mid-Victorian period owed much of their success to the birth of modern Gothic architecture, and many of their designs were produced by such famous architects as Pugin, Gilbert Scott, Street, &c., so that between 1850 and 1880 encaustic tiles had a great vogue for pavement work not only in England, but in all civilized countries, and fine examples of the rich encaustic pavements made at Mintons', Maw's, or Godwin's of Hereford, are to be found in most of the restored cathedrals and churches of this period.

Side by side with the revival of this ancient process, there was developed an essentially modern process of manufacturing by compressing pulverized clay in metal dies under a screw press. This was the outgrowth of a patent granted to Richard Prosser in 1840, and worked out and perfected at the works of Minton at Stoke-upon-Trent. The advantages of this method of manufacture consist in (*a*) greater rapidity in execution than can be effected by the plastic method, and (*b*) the greater mechanical accuracy of the finished tile due to the steel dies used in shaping the tile and to the diminished contraction in drying and firing. This essentially modern method of tile-making is really an outcome of the methods introduced in the manufacture of English earthenware (see CERAMICS), and it has not only been extensively developed in England, but has been adopted, practically without modification, in all the leading countries of Europe and in the United States.

The manufacture of tiles by the compression of powdered clay rendered possible the introduction of many varieties—plain, inlaid, embossed and incised. The designs in these cases, though generally based on old work, are so different, especially in mechanical finish, that they form a class of tiles entirely distinct from old work. Economically, and for all practical purposes, they afford a style such as the world has never before seen, but, like many modern productions—perfect in execution and finish—they lack the spontaneity and artistic charm of the work of bygone days.

Since the middle of the 19th century artist-potters in many countries have gone back to the ancient methods of production for richly painted tile panels, and, in this connexion, the productions of Deck in France, William de Morgan and Pilkington's in England, mark a distinct departure from contemporary modern work.

The extended use of tiles for interior decoration has created a large trade in these articles, either for wall or floor decoration. Among the most important firms engaged in this branch of the ceramic industry must be mentioned Mintons, Hollins & Co., Maw & Co., and Pilkington's in England; Villeroy & Boch in Germany; Utschneider & Co. in France; Boch Frères in Belgium; Thooft & Labouchere at Delft, Holland; and the American Encaustic Tile Co., in the United States.

LITERATURE.—Besides the works mentioned in connexion with special sections in the text a good deal of information about tiles in general, and modern tiles in particular, will be found in Furnival, *Leadless Decorative Tiles*, &c.; L. L. Jewitt, *Ceramic Art of Great Britain*; see also Forrer, *Geschichte der europäischen Fliesen-Keramik*. (W. B.*)

TILLEMONT, SÉBASTIEN LE NAIN DE (1637–1698), French ecclesiastical historian, was born in Paris on the 30th of November 1637. His father, a wealthy member of the legal class, being a devoted Jansenist, the boy was brought up in the little schools of Port Royal. Here his bent towards historical study was warmly encouraged, and in 1660 he was made a tutor in the seminary of Buzenval, Jansenist bishop of Beauvais. Ten years later he came back to Paris, and was eventually persuaded (1676) to enter the priesthood, and become a chaplain at Port Royal. In 1679 the storm of persecution drove him to settle on his family estate of Tillemont, between Montreuil and Vincennes. There he spent the remainder of his life, dying on the 10th of January 1698. He was buried at Port Royal; in 1711, on the desecration of the cemetery, his remains were transferred to the church of St André des Arcs in Paris.

From the age of twenty he was at work on his two great books—the *Mémoires pour servir à l'histoire ecclésiastique des six premiers siècles*, and the *Histoire des empereurs* during the same period. Both works began to appear during his lifetime—the *Histoire* in 1690, the *Mémoires* in 1693—but in neither case was the publication finished till long after his death. To his modesty Bossuet bears witness, when he told him to stand up sometimes, and not be always on his knees before a critic. Gibbon vouches for his learning, when (in the 47th chapter) he speaks of "this incomparable guide, whose bigotry is overbalanced by the merits of erudition, diligence, veracity and scrupulous minuteness." There is a full account of his life in the 4th volume of Sainte-Beuve's *Port Royal.*

TILLEY, SIR SAMUEL LEONARD (1818–1896), Canadian statesman, was born at Gagetown, New Brunswick, on the 18th of May 1818, the son of Samuel Tilley, an American Loyalist, who had settled in St John in 1783. In 1850 he was elected to the local legislature as a Liberal representative of St John. He soon became prominent from his opposition to the liquor traffic, and in 1855 persuaded the assembly to pass a prohibitory law, which proved a failure, and was repealed. From 1860 to March 1865 he was premier of the province, and was prominent in organizing the conference on the union of the maritime provinces, which met at Charlottetown in 1864, and which soon widened into a discussion of Canadian federation. In 1865 he was defeated in a general election on the federation question, but returned to power in 1866, partly through an intrigue of the colonial office. From 1868 till November 1873 he held various portfolios in the Dominion cabinet; from 1873 to 1878 he was lieutenant-governor of New Brunswick, but in 1878 was again elected as member for St John, and entered the Conservative cabinet as minister of finance. Later in 1878 he introduced and carried through parliament the "national policy" of protection, on which issue the election of 1878 had been won. The tariff so introduced became the basis of Canadian financial policy. In October 1885 ill health forced him to retire from the cabinet, and he was again appointed lieutenant-governor of New Brunswick, which position he held till 1893. He died on the 25th of June 1896. In 1879 he was created K.C.M.G. His kindly and honourable private character was admitted by all; his political merits are judged differently by advocates and opponents of the policy of protection which he introduced, but of his financial ability and grasp of detail there is no doubt.

His *Life*, by James Hannay (1907), forms one of the "Makers of Canada" series.

TILLODONTIA, a group of mammals of uncertain position, typified by *Tillotherium* from the Middle Eocene of Wyoming,

(From Marsh.)

Skull of *Tillotherium fodiens.* (½ nat. size.)

and perhaps including *Esthonyx* from the Lower Eocene of the same district, and other genera from the same horizon in both North America and Europe. In *Tillotherium* the skull is decidedly rodent-like, with an elongated cranial and a short facial portion, and a small brain-cavity; the jugal bone occupying the middle of the zygomatic arch. The dentition, of which the formula is *i.* $\frac{2}{2}$, *c.* $\frac{1}{1}$, *p.* $\frac{3}{2}$, *m.* $\frac{3}{3}$, also approximates to the rodent type, the canines being minute and functionless, and the first pair of incisors large and chisel-like. On these and other grounds it has been suggested that *Tillotherium* (of which the greater part of the skeleton is known) indicates the ancestral form of the Rodentia. Professor Max Weber considers, however, that such a view has but little justification. Relationship with the Ungulata and Carnivora has also been suggested; if there be any with the latter, it must have been with the most primitive forms, as the plantigrade feet are furnished with five toes carrying long pointed claws.

Possibly *Platychoerops richardsoni*, from the Lower Eocene London Clay, belongs to the group. (R. L.*)

TILLOTSON, JOHN (1630–1694), English archbishop, was the son of a Puritan clothier in Sowerby, Yorkshire, where he was born in October 1630. He entered as a pensioner of Clare Hall, Cambridge, in 1647, graduated in 1650 and was made fellow of his college in 1651. In 1656 he became tutor to the son of Edmond Prideaux, attorney-general to Cromwell. About 1661 he was ordained without subscription by T. Sydserf, a Scottish bishop. Tillotson was present at the Savoy Conference in 1661, and remained identified with the Presbyterians till the passing of the Act of Uniformity in 1662. Shortly afterwards he became curate of Cheshunt, Herts, and in June 1663, rector of Kedington, Suffolk. He now devoted himself to an exact study of biblical and patristic writers, especially Basil and Chrysostom. The result of this reading, and of the influence of John Wilkins, master of Trinity College, Cambridge, was seen in the general tone of his preaching, which was practical rather than theological. He was a man of the world as well as a divine, and in his sermons he exhibited a tact which enabled him at once to win the ear of his audience. In 1664 he became preacher at Lincoln's Inn. The same year he married Elizabeth French, a niece of Oliver Cromwell; and he also became Tuesday lecturer at St Lawrence, Jewry. Tillotson employed his controversial weapons with some skill against atheism and popery. In 1663 he published a characteristic sermon on "The Wisdom of being Religious," and in 1666 replied to John Sergeant's *Sure Footing in Christianity* by a pamphlet on the "Rule of Faith." The same year he received the degree of D.D. In 1670 he became prebendary and in 1672 dean of Canterbury. In 1675 he edited John Wilkins's *Principles of Natural Religion*, completing what was left unfinished of it, and in 1682 his *Sermons.* Along with Burnet, Tillotson attended Lord Russell on the scaffold in 1683. He afterwards enjoyed the friendship of Lady Russell, and it was partly through her that he obtained so much influence with Princess Anne, who followed his advice in regard to the settlement of the crown on William of Orange. He possessed the special confidence of William and Mary, and was made clerk of the closet to the king in March 1689. It was chiefly through his advice that the king appointed an ecclesiastical commission for the reconciliation of the Dissenters. In August of this year he was appointed by the chapter of his cathedral to exercise the archiepiscopal jurisdiction of the province of Canterbury during the suspension of Sancroft. He was also about the same time named dean of St Paul's. Soon afterwards he was elected to succeed Sancroft; but accepted the promotion with extreme reluctance, and it was deferred from time to time, at his request, till April 1691. In 1693 he published four lectures on the Socinian controversy. His attempts to reform certain abuses of the Church, especially that of clerical non-residence, awakened much ill-will, and of this the Jacobites took advantage, pursuing him to the end of his life with insult and reproach. He died on the 22nd of November 1694.

For his manuscript sermons Tillotson's widow received 2500 guineas. Ralph Barker edited some 250 of them together with the "Rule of Faith" (1695-1704). In 1752 an edition appeared in 3 vols., with *Life* by Thomas Birch, compiled from Tillotson's original papers and letters. Various selections from his sermons and works have been published separately, *e.g.* by G. W. Weldon in 1886.

TILLY, JOHANN TZERCLAES, COUNT OF (1559–1632), general of the Catholic League in the Thirty Years' War, was born in 1559 at the château of Tilly in Brabant. He was destined for the priesthood and received a strict Jesuit education. But, preferring the career of a soldier, he entered a Spanish foot regiment about 1574 as a volunteer, and in the course of several campaigns rose to the command of a company. This being reduced, he again became a simple pikeman, and as such he took part in the famous siege of Antwerp by Parma, whose army afforded the best training in the art of war then obtainable. He distinguished himself by his bravery, and the duke of Lorraine gave him the governorship of Dun and Villefranche, which he held from 1590 to 1594. Henry IV. made tempting offers, which were refused, to induce him to enter the service of France. Somewhat later he left the Spanish service for that of Austria to fight against the Turks. In 1602 he became colonel in the imperial army, and raised a regiment of Walloon infantry, which he commanded in the assault on Budapest, receiving a severe wound. In 1604 he was made general of artillery, and handled his new force with conspicuous success; the campaign of this year showed Tilly as a soldier of great capacity, and in 1605 he was made a field-marshal. His part in the dissensions in Austria, which preluded the Thirty Years' War, was marked by unswerving loyalty and devotion to the emperor and the Catholic religion. In 1610 he left the service of the emperor to enter that of Maximilian, duke of Bavaria, the head of the Catholic League. It was not, however, until 1620 that he became lieutenant-general to Maximilian and commander-in-chief of the field forces.

With the great victory of the Weisser Berg near Prague (1620) the new army and its leader became celebrated throughout Germany, and the long and weary campaigns against Christian, Mansfeld and the Protestant princes of the north-west established their reputation. The chief battles were Wimpfen (1622), Stadtlohn (1623), Wiesloch (1622), Höchst (1622), the last being a great victory for the Catholic forces, and winning for Tilly the title of count, which was given by the emperor himself (1622). The military operations of the Thirty Years' War will be found described under that heading. With the intervention of the king of Denmark, the struggle entered upon a new phase, and on the imperial side a new army, that of Wallenstein, appeared on the scene, though it was the army of the League which won the great success of the war at Lutter-am-Barenberge (1626). Throughout these arduous campaigns Tilly had other than military difficulties with which to contend. The military superiority of his veterans, trained as they were to his own ideal of "a ragged soldier and a bright musket," may be held to explain his victories over superior numbers, but the energy which he displayed in the midst of political difficulties was not less conspicuous than his leadership and strategy. On two occasions, at least, he was thwarted by orders from the League; once the Protestants were allowed to escape into Holland, once the army of Wallenstein was left to its own resources in the presence of the enemy. That the League achieved the successes which it actually did, was to the credit of Tilly and his men rather than to any action of the allied princes. It may be that Tilly cannot be considered as great a soldier as Wallenstein; it should, however, be borne in mind that the League army never possessed the prestige of an imperial force: that Tilly was repeatedly thwarted by political considerations, and that, even so, the hardest part of the task was achieved by the League army.

The defeat of King Christian was soon followed by the intervention of Gustavus Adolphus, a great captain at the head of the finest troops in Europe. But Tilly was the best general of the old school; the League troops were trained after the Spanish model, and the opening stages of the campaign did not display any marked superiority of the Swedes. At this time Tilly was commander of the imperial forces as well as of his own army. The first great contest was for the possession of Magdeburg (1631). After one of the fiercest struggles of the war the town was taken by storm on the 20th of May, and the sack which followed was accompanied with every sort of atrocity. For this the old general has been held responsible, yet it was rather the magnitude of the catastrophe than its special cruelties which made it the most striking example of military barbarity in modern history. Tilly's personal exertions saved the cathedral and other religious buildings from pillage and fire. Four months later Tilly and Gustavus, the representatives of the old and the new art of war, met in the battle of Breitenfeld (*q.v.*). The victory of Gustavus was complete, though the imperial general, severely wounded as he was, managed to draw off his men in good order. A few more months of campaigning brought the two armies to the Lech, where Gustavus was again victorious, and Tilly received a mortal wound. He died on the 30th of April 1632, in Ingolstadt, and was buried in the church at Altenötting in Bavaria.

See O. Klopp, *Tilly im 30-jährigen Krieg* (Stuttgart, 1861); K. Wittich, *Magdeburg, Gustav Adolf und Tilly*; also memoir of Tilly in *Allg. deutsche Biographie*; Keym-Marcour, *Johann Tzerclaes, Graf v. Tilly*; Count Villermont, *Tilly, ou La Guerre de trente ans* (Tournay, 1859).

TILSIT, a town of Germany, in the Prussian province of East Prussia, situated on the left bank of the Memel or Niemen, here crossed by an iron railway bridge, 57 m. S.E. of Memel and 72 N.E. of Königsberg by rail. Pop. (1905), 37,148. The town has a number of handsome modern buildings, including a town hall, a post office, law courts, and a large hospital. It contains four Protestant churches, among them the German church, with a handsome steeple, and the curious circular Lithuanian church, a Roman Catholic church, a Jewish synagogue and a classical school (*Gymnasium*). The manufactures include machinery, chemicals, soap, leather, shoes, glass and other articles, and there are iron-foundries, breweries, and steam flour and saw-mills. Tilsit carries on trade in timber, grain, hemp, flax, herrings and coal; but its trade with Russia, at one time considerable, has fallen off since the construction of the railway from Königsberg to Kovno. The river is navigable above the town, and there is a steamboat communication with Königsberg, Memel and Kovno.

Tilsit, which received civic rights in 1552, grew up around a castle of the Teutonic order, known as the "Schalauner Haus," founded in 1288. It owes most of its interest to the peace signed here in July 1807, the preliminaries of which were settled by the emperors Alexander and Napoleon on a raft moored in the Memel. This treaty, which constituted the kingdom of Westphalia and the duchy of Warsaw, registers the nadir of Prussia's humiliation under Napoleon. The poet Max von Schenkendorf (1784–1817) was born at Tilsit.

See *Aus Tilsits Vergangenheit* (5 vols., Tilsit, 1888–1892); and R. Thimm, *Beiträge zur Geschichte von Tilsit* (Tilsit, 1893).

TIMAEUS (*c.* 345–*c.* 250 B.C.),[1] Greek historian, was born at Tauromenium in Sicily. Driven out by Agathocles, he migrated to Athens, where he studied rhetoric under a pupil of Isocrates and lived for fifty years. During the reign of Hiero II. he returned to Sicily (probably to Syracuse), where he died. While at Athens he completed his great historical work. The *Histories*, in at least 38 (Bury says 33) books, was divided into unequal sections, containing the history of Italy and Sicily in early times; of Sicily alone; of Sicily and Greece; of the cities and kings of Syria (unless the text of Suïdas is corrupt); the lives of Agathocles and Pyrrhus, king of Epirus. The chronological sketch (Ὀλυμπιονῖκαι, the victors at Olympia) perhaps formed an appendix to the larger work. Timaeus was bitterly attacked by other historians, especially by Polybius, and indeed his unfairness towards his predecessors, which gained him the nickname of *Epitimaeus* (fault-finder), laid him open to retaliation. Polybius was a practical soldier and statesman, Timaeus a bookworm without military experience or personal knowledge of the places he described. The most serious charge against Timaeus is that he wilfully distorted the truth, when influenced by personal considerations: thus, he was less than fair to Dionysius and Agathocles, while loud in praise of his favourite Timoleon. On the other hand, as even Polybius admits, Timaeus consulted all available authorities and records. His attitude towards the myths, which he claims to have preserved in their simple form (hence probably his nickname γραοσυλλεκτρία, "collector of old wives' tales," though some authorities render this "old rag-woman," in allusion to his fondness for trivial details), is preferable to the rationalistic interpretation under which it had become the fashion to disguise them. Timaeus also devoted much attention to chronology, and introduced the system of reckoning by Olympiads, with which he compared the years of the Attic archons, the Spartan ephors, and the priestesses of Argos. This system, although not adopted in everyday life, was afterwards generally used by the Greek historians. Although a pupil of Philiscus of Miletus, a disciple of Isocrates, Timaeus is a representative of the Asiatic style of Hegesias of

[1] J. E. Sandys, *c.* 350–*c.* 260; J. B. Bury, 340–256.

Mognesia rather than of the Attic (see Norden, *Griech. Kunstprosa* i. 136). Both Dionysius of Halicarnassus and the pseudo-Longinus characterized him as a model of "frigidity" (ψυχρόν), although the latter admits that in other respects he is a competent writer. Cicero, who was a diligent reader of Timaeus, expresses a far more favourable opinion, specially commending his copiousness of matter and variety of expression. Timaeus was one of the chief authorities used by Trogus Pompeius, Diodorus Siculus and Plutarch in his life of Timoleon.

TIMANTHES, of Cythnus or Sicyon, a Greek painter of the 4th century B.C. The most celebrated of his works was a picture representing the sacrifice of Iphigenia, in which he finely depicted the emotions of those who took part in the sacrifice; but despairing of rendering the grief of Agamemnon, he represented him as veiling his face. A painting discovered at Pompeii, and now in the Museum at Naples, has been regarded as a copy or echo of this painting (Helbig, *Wandgemälde Campaniens*, No. 1304).

TIMARU, a seaport of Geraldine county, New Zealand, on the E. coast of South Island, 100 m. S.W. of Christchurch by rail. Pop. (1906), 7615. The slight inward sweep of the coast forms the Canterbury Bight, and the shore-line northward from Timaru is called the Ninety-mile Beach. The harbour is formed by breakwaters enclosing a space of 50 acres. Chief exports are wool, flour and frozen meat, and the industries are in connexion with these. Opals are found in the district. The Anglican church of St Mary is built of Oamaru and bluestone, with a roof of kauri wood. Caroline Bay, to the north, is a bathing resort. The volcanic soil is highly fertile. Timaru is the chief town in South Canterbury district, and the seat of the supreme and district courts. A branch railway traverses the inland agricultural district.

TIMBER, the term given to wood cut and shaped for building purposes, or growing wood suitable for such purposes; in English law the tenant for life may not cut such trees (see WASTE). The word appears in many forms in various Teutonic languages, meaning originally material to be used for building purposes; in the case of Ger. *zimmer*, and Du. *timmer*, both meaning "room," the word has been transferred to the structures made of this material. The root is seen in Gr. δέμειν, to build, and Lat. *domus*, house.

The wood used in building is obtained from trees of the class known to botanists as *exogens*, or those trees which grow larger by the addition each year of a layer of new wood on their outer surface. A transverse section of a tree of this class shows it to consist of three distinct parts: the pith or medulla, the wood, made up of annual rings or layers, and the bark. The pith is in the centre of the tree and around it the wood is disposed in approximately concentric rings; that part near the pith is hard and close in grain, and from its position is termed heart-wood. The sap-wood is made up of the outer layers or rings, and these are softer than the heart and generally of more open grain. Each annual ring is made up of two parts—an inner soft portion light in colour, and a hard, dark-coloured outer portion. The inner portion is formed early in the season and is termed "spring wood," the darker part being called "autumn wood." The medullary rays extend radially from the centre of the tree to the bark at right angles to the grain of the wood, and serve during life to bind the whole together as well as to convey nourishment from one part of the tree to another.

The greatest care should be exercised in the selection of trees for felling. If the tree is too young the proportion of sap-wood is large, and the heart-wood is not so hard as that of a tree of mature age. The wood of an old tree, on the other hand, has lost a great part of its toughness, and is of bad colour, brittle and often predisposed to decay. In trees that have arrived at a mature age the heart-wood is in its largest proportion and the sap-wood is firm and elastic; and the timber from such trees is of the strongest, toughest and most durable character. The age at which the northern pine and Norway fir arrive at maturity is between seventy and one hundred years. The larch, elm and ash should be felled when the trees are between the ages of fifty and one hundred years. The oak should be about one hundred years old when it is cut. The best time of the year for felling timber is in midsummer or midwinter, when the sap of the tree is at rest; it is not desirable to cut timber in the spring or autumn. By some authorities it is considered a good plan to remove the bark in the early spring and fell the tree in the ensuing winter.

Felling Timber.

As soon as possible after felling, logs should be converted by sawing into scantling sizes, for if the log is left to dry or season, it is liable on shrinking to split. The usual method is to saw a log into planks or boards by cutting it into slices longitudinally as shown in fig. 1; this is called bastard sawing, and is the most economical method, but, as will be seen in the diagram, the quality of the boards will vary very much, some consisting almost entirely of sap-wood cut at a tangent to the annular rings such as *a*, *b*, *c*, whilst the centre boards contain the heart-wood cut in the best way at right angles across the annual rings as *d*, *e*, *f*. For oak and other hard woods another method of conversion is often adopted, called quarter sawing. The log is first cut into quarters and then sawn diagonally (fig. 2). In oak this develops the beautiful silver grain by cutting longitudinally through the medullary rays. Timber is now generally sawn into marketable sizes in the country of its growth, and shipped as scantling timber.

Conversion of Timber.

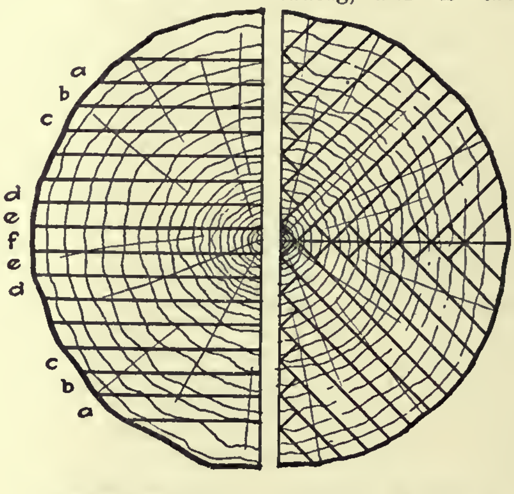

FIG. 1. FIG. 2.

Definitions and sizes are given below of the most usual forms of sawn timber:—

A *log* is the trunk of a tree with the bark removed and branches lopped.

A *balk* is a log hewn or sawn to a square section, and varying in size from 11 to 18 in. square.

Planks are parallel-sided pieces of timber from 2 to 6 in. thick, 11 or more ins. wide, and from 8 to 21 ft. long.

Deals are similar pieces 9 in. wide, and 2 to 4 in. thick.

Battens are similar to deals, but not more than 7 in. wide. Pieces of planks, deals and battens under 8 ft. long are called ends. Many of the soft woods, such as pine and fir, are sold by the standard. The standard of measurement most in use is the St Petersburg standard, which contains 165 cubic ft. or 720 lineal ft. of 11 in. by 3 in.

A *load* of sawn or hewn timber contains 50 cub. ft., and a load of unhewn timber 40 cubic ft.

A *square* is a superficial measurement, used chiefly for boarding, and contains 100 sq. ft.

Norwegian timber is stencilled with the shipper's initials in blue letters painted on the ends. Swedish timber is stencilled with red letters or devices, the inferior qualities in blue. Prussian timber is scribed on the sides near the middle. By scribing is meant that the distinguishing letters are roughly cut in with a gouge. Russian timber is dry-stamped or hammer-branded on the ends. American (Canadian) timber is stencilled in black and white. United States timber is marked with red chalk on the sides.

Seasoning.

To fit timber for use in building construction the superfluous sap and moisture contained in the green wood must be evaporated, either by natural or artificial means. During this process the wood shrinks considerably, and unless much care and attention are given to the drying wood it will warp and shake sufficiently to unfit it for practical uses. After the log is converted into scantlings, or "lumber," as it is termed in America, it is stacked in the timber yard under covered sheds with open sides to enable it to "season." The wood is carefully piled in tiers or courses, with strips of wood about an inch thick between each layer, so as to allow of the free circulation of air all round each piece. This is the natural and best method of seasoning, and timber treated in this way is more durable than that seasoned by artificial methods; the time taken, however, is much longer. For joiners' work the drying of the wood is often hastened by stacking the timber in well-ventilated rooms kept at a temperature of from 80° to 150° F. The time taken in seasoning wood by this desiccating process is not more than one-tenth of that occupied in the natural or open-air method. Where it is convenient, timber is sometimes treated with a water seasoning process which enables it to be more easily dried. The wood is placed in a running stream and so tied or chained down as to be entirely submerged. The water enters the pores of the wood (which should be placed with the butt end pointing up stream) and dissolves and forces out the sap. After about two weeks in this position it is taken out and stacked in open sheds to be dried in the natural way, or treated by warm air in special chambers. Steaming and boiling are sometimes resorted to as artificial means of seasoning, but not to any great extent, as the timber deteriorates under such treatment, and the cost of the process is in many cases prohibitive. When wood is required to be bent, however, this is often the method that is adopted to soften the material, so as to allow it to be bent easily. The time allowed in the English government dockyards for the natural process of seasoning for hard woods such as oak is, for pieces 24 in. sq. and upwards, 26 months; from 16 in. to 20 in. sq., 18 months; from 8 in. to 12 in. sq., 10 months; from 4 in. to 8 in. sq., 6 months. Soft woods are allowed half these periods. When the wood is required in a "dry" state for joiners' work, twice the length of time is given. Planks are allowed from a half to two-thirds of the above time, according to their thickness.

Defects in Timber.

Deals with coarse annual rings (*i.e.* coarse grain) should be rejected for good work, as also should those with waney or naturally bevelled edges. The wide annual rings show that the tree was grown too quickly, probably in marshy ground. Timber with waney edges has a large proportion of sap-wood, and is cut either from a small tree or from the outer portion of a large one, the waney edge being obviously due to irregularities in the surface of the tree. "Cup shake" is a natural splitting in the interior of the tree between two of the annular rings. It is supposed to be caused in severe weather by the freezing of the ascending sap. "Heart shake" is often found in old trees and extends from the pith or heart of the tree towards the circumference. When there are fissures radiating in several directions it is called "star shake." "Upsets" are the result of some crushing force or violent shock to the balk or log. "Foxey" timber is tinged with dull red or yellow stains, indicating incipient decay. "Doatiness," similarly, is a speckled or spotted stain denoting decay in certain varieties of timber, such as beech and some kinds of oak.

Decay in Timber.

The primary causes of decay in timber are the presence of sap, exposure to conditions alternately wet and dry, and want of efficient ventilation, especially if accompanied by a warm and moist atmosphere. Timber is most durable when it is kept quite dry and well ventilated, but some varieties last an indefinite period when kept continually under water. When, on the other hand, the wood becomes alternately wet and dry, "wet rot" results. The wood affected shrivels up and becomes reduced after a time to a fine brown powder. It is only by actual contact that wet rot affects the surrounding good wood, and if the decayed timber is cut out the remainder of the wood will be found to be unaffected.

"Dry rot," which usually attacks the sap-wood, generally starts in a warm damp unventilated place, and is caused by the growth of fungi, some of which are visible to the naked eye, some microscopic. The spores from the fungi on the decayed wood float in the air and alight on any adjacent timber, infecting this also if the conditions be favourable. In this way the disease is spread rapidly, continually eating into the timber, which is first rendered brittle, and then reduced to powder. A strong growth of the fungus gives the appearance of mildew on the wood, and produces an unpleasant musty smell. The spores of the fungus will find a way through brickwork, concrete and similar material, in order to reach woodwork that may be on the other side. Dampness and a close atmosphere are essential to the growth of dry rot, and it is under these conditions that it spreads most quickly, the fungus soon dying when exposed to the fresh air.

Preservation of Timber.

There will be little danger of the decay of timber used in the construction of ordinary buildings if care has been taken, in the first place, to have it well seasoned, and, in the second, to ensure its being well ventilated when fixed in position. There are, however, several preservative processes to which timber may be subjected when it is to be fixed in positions which favour its decay (see also DRY ROT). In creosoting, which was invented by J. Bethell and patented by him in 1838, the timber is impregnated with oil of tar. This may be done by soaking the wood in the hot oil for several hours, but the better way is to place the seasoned timber in an iron chamber in which a partial vacuum is created by exhausting the air. The creosote is then forced in at a pressure of from 100 lb to 160 lb to the sq. in., according to the size of the timber. In warm weather the pressure need not be so great as in winter. The whole process only occupies from two to three hours. Soft woods take up from 10 to 12 lb to the cub. ft.; hard woods are not usually treated by this process. Kyan's process, patented in 1832, consists in impregnating the timber with corrosive sublimate which, acting on the albumen in the wood, converts it into an indecomposable substance. Boucherie, a Frenchman, originated a system in which the sap is expelled from the timber under pressure, and a strong solution of copper sulphate is then injected at the end of the wood. In Blythe's process the timber is dried, and crude carbolic acid injected. In Burnett's process a solution of zinc chloride is forced into the pores of the wood. A new process of preserving timber by means of steam heat has been tried and seems to be effectual. The wood is placed in closed chambers and steam admitted at high pressure (200 lb to the sq. in.). The heat and pressure together exert a chemical action upon the sap, which becomes insoluble and itself preserves the wood from decay.

Posts that are to be fixed in the ground should have their buried ends either charred or else well tarred. External woodwork may be protected by painting or oiling.

Varieties.

The timber used in building is obtained from trees which may be classed under two heads: (1) Coniferous or needle-leaved trees; (2) the non-coniferous or broad-leaved trees.

Coniferous Trees.—This class includes most of the soft woods which furnish timber for the framing and constructional portions of nearly all building work. They are also used for the finishing joinery of the ordinary class of building. The numerous varieties of pine which are used more extensively than any other kind of wood are included in this class.

The northern pine (*Pinus sylvestris*) has a number of other names and may be referred to under any of the following: Scotch fir, red deal, red fir, yellow deal, yellow fir, Baltic pine, Baltic fir. It grows in Sweden, Norway, Russia, Germany and Great Britain, and often gets a name from the port of shipment, such as Memel fir, Danzig fir, Riga fir, and so on. The colour of the wood of the different growths of northern pine varies considerably, the general characteristics being a light reddish yellow colour. The annual rings are well defined, each ring consisting of a hard and a soft portion, respectively dark and light in colour. No medullary rays are visible; the wood is straight in the grain, durable, strong and elastic, easy to work, and is used by the carpenter for internal and external constructional work, and by the joiner for his fittings. Tar, pitch and turpentine are obtained from the wood of this tree, which weighs from 30 to 38 lb per cub. ft.

The white fir, or Norway spruce (*Abies excelsa*), is exported from Russia, Sweden and Norway, where it grows in enormous quantity. It is the tallest and straightest of European firs, growing with a slender trunk to a height of from 80 to 100 ft. Like the northern pine, it is called by several names, such as "spruce," "white deal," "white wood," "Norway fir." The colour of the cut wood is a very light yellowish or brownish white, the hard parts of the annual rings being of a darker shade. A characteristic feature is the large number of very hard black knots which the wood contains. It is easy to work, but rather inferior in all respects to the northern pine. Its weight per cubic foot averages about 33 ℔.

The red pine (*Pinus resinosa* or *P. rubra*) is also known as "Canadian pine" and "American deal." It grows in the northern parts of North America, where the tree attains a height of 60 or 70 ft. with a diameter of from 12 to 30 in. It weighs about 36 ℔ to the cubic foot. In Canada it is called "Norway pine" and "red pine" from the colour of the bark. The wood is white, tinged with yellow or red, of fine grain, and works to a smooth lustrous surface remarkably free from knots.

The white pine (*Pinus strobus*) is exported from the northern parts of the United States of America and from Canada. Other names for this timber are "yellow pine" and "Weymouth pine," the last name originating in the fact that the earl of Weymouth first introduced it into England. The tree attains a height of from 150 to 200 ft. with a thickness of trunk at 5 ft. from the bottom of from 5 to 10 ft. The wood when cut is white or yellowish white, straight in grain and easily worked, but is not so tough, elastic or durable as the northern pine, and therefore is not so suitable for constructional work. For joiners' work, however, it is well adapted, and glue adheres strongly to it, though nails do not hold well. It weighs about 30 ℔ per cub. ft.

The Kauri pine (*Dammara australis*) is a native of New Zealand. It grows to a height of from 80 to 140 ft., with a straight stem 4 to 8 ft. in diameter. The wood is a light yellowish brown in colour, fine in grain and of even texture, the annular rings being marked by a darker line. It is strong, elastic and resinous. A cubic foot weighs about 35 to 40 ℔.

The pitch pine (*Pinus rigida*) is a native of Canada and is common throughout the United States of America. It is remarkable for the large quantity of resin it contains, the weight of the wood, which is about 48 ℔ per cub. ft., and the strong red markings of the grain, usually straight but sometimes exhibiting a beautiful figure. Its weight and strength, and the large size of the balks, make it very valuable for heavy constructional works and piling, and its fine figure makes it equally valuable for joinery.

Of the larch the best known variety is the European larch (*Larix europaea*), which grows in Switzerland, Italy, Russia and Germany. The larch frequently attains a height of 100 ft. but the average height is about 50 ft. and diameter 3 ft. The wood is extremely durable and lasts well where exposed alternately to wet and dry; indeed, the larch is useful for every purpose of building, internal and external. It is the hardest and toughest of the cone-bearing trees and weighs 30 to 40 lb per cub. ft.; it has a straight grain free from many knots; in colour it is of a rather deep yellow or brownish tint, with the hard portions of the annular rings marked in a darker red. The American black larch (*Larix pendula*) and the American red larch (*Larix microcarpa*) are native to North America. The latter tree is of comparatively little service. The black larch yields timber of good quality, nearly equal to that of the European tree.

The cedar used in building work is really a species of juniper. The Virginian red cedar (*Juniperus virginiana*) grows in the United States, Canada and the West Indies. The tree produces excellent timber, and is much used for furniture, its strong acrid taste driving away insects. It weighs about 40 ℔ per cub. ft. The Bermuda cedar (*Juniperus bermudiana*) is used for internal joinery and is extremely durable.

Hard Woods.—The timbers in the second class are obtained from non-coniferous trees, containing no turpentine or resin, and are given the general name of hard woods. Their initial expense and the high cost of working preclude their general use, and they are consequently reserved to a great extent for specially heavy constructional work and ornamental finishing joinery.

The oak (*Quercus*), of which some sixty distinct species are known, grows freely in Europe and America. Several kinds yield valuable timber: in England the two best-known varieties are *Quercus pedunculata* and *Quercus sessiliflora*. There is little difference between the quality of the two woods, the variation being in the foliage and fruit. The wood is very hard, tough, with fine regular grain and close texture, the annular rings being distinct and the medullary rays well marked. When it is cut along these rays beautiful markings are revealed, called silver grain. The colour is a light brown, and its weight is about 50 to 56 ℔ per cub. ft. Oak is very durable either in a dry or a wet situation, or in a position where it will be alternately dry and wet. It is very suitable for constructional and engineering works, and it supplies one of the finest woods for ornamental joinery work. The Durmast oak grows in France and the south of England; it is not so strong or durable as the English oak. Baltic oak is grown in Norway, Russia and Germany, and is exported from the Baltic ports. Though inferior to the English oak, it is very straight in the grain and free from knots. Austrian oak is light in colour, and is much used for joinery work. White oak comes principally from Canada, under the name of American oak. It is straight in grain but subject to warping, and is not so durable as British oak.

The common walnut (*Juglans regia*) grows in Great Britain. On account of its scarcity it is little used for building purposes, except for ornamental joinery, being more used by the cabinet and furniture maker. A cubic foot weighs about 45 ℔. The white walnut (*Juglans alba*) or hickory is common in North America, and is very tough, hard and elastic. The black walnut (*Juglans nigra*) is also native to America. It has a fine grain with beautiful figure, and takes a fine polish. It weighs 56 ℔ per cub. ft.

Of the elm (*Ulmus*) there are five common varieties, the two most cultivated being the rough-leaved elm (*Ulmus campestris*), which is grown in large quantities in England and North America, and the smooth-leaved wych elm (*Ulmus glabra*). The colour of the wood is brown; it is hard, heavy, strong and very tough, and when kept either always wet or always dry is durable. Elm is very liable to warp and shake, is porous and usually cross-grained. The piles of old London Bridge were of elm, and after six centuries of immersion were but little decayed. The wood is not much used in building operations. It weighs about 40 ℔ per cub. ft.

The common ash (*Fraxinus excelsior*) is a native of Europe and Northern Asia, and is grown extensively in Great Britain. Its colour is light brown, sometimes with a greenish tint, with the annular rings of darker colour. The wood is very tough and strong, and superior to most wood in elasticity; and it weighs 40 to 55 ℔ per cub. ft.

Beech (*Fagus sylvatica*) grows in the temperate districts of Europe. The wood is heavy, strong and hard; white to light reddish-brown in colour; and durable if kept either dry or wet; is porous and works easily; it weighs about 40 to 48 ℔ per cub. ft. The red beech (*Fagus ferrugina*) is common in North America.

Sycamore (*Acer pseudo-platanus*), sometimes mistakenly called the plane tree, is common in Germany and Britain and in the eastern states of North America. It is a large tree of rapid growth. The wood is light brown or yellowish white, with annular rings not very distinct, often cross-grained and of uniformly coarse texture. It warps and cracks rather badly, and weighs from 35 to 42 ℔ per cub. ft.

Teak (*Tectona grandis*) is a native of southern India and Burma. It grows rapidly to a great height, often exceeding 150 ft., with a straight trunk and spreading branches. Teak wood is straight in the grain and exceptionally strong and durable, its oily nature enabling it to resist the attacks of insects and to preserve iron nails and fastenings. It weighs from 45 to 56 ℔ per cub. ft.

Mahogany (*Swietenia mahogani*) is a native of the West Indies and Central America, the best-known varieties being Cuban or Spanish and Honduras. The Spanish wood has a darker colour and richer figure than the Honduras, and is therefore preferred for ornamental joinery work. The colour of mahogany is reddish brown, and in the Cuban wood the pores are often filled with a white chalky substance which is usually absent in the Honduras variety; the latter, however, may be obtained in larger sizes, and is straighter in the grain and easier to work. Spanish mahogany weighs about 56 ℔ to the cubic ft., and the Honduras variety about 36 ℔.

Greenheart (*Nectandra rodiaei*) is a very heavy, hard and durable wood from the East Indies. It ranges in colour from pale yellow to a deep brown, and the grain is very compact and of close texture. The wood contains an oil which enables it to resist the attack of sea worms, and this quality makes it suitable for use in marine construction. The average weight of a cubic foot is about 61 ℔.

Basswood (*Tilia americana*) is common in Canada and in the northern United States. It is soft and easy to work, and of even texture and straight grain. It may be obtained in wide boards, and thus is fitted for use in large panels. It weighs about 30 ℔ per cub. ft.

There are several varieties of maple growing in Canada and the United States, but the one in most common use is the sugar maple, also called rock maple, which grows freely in the districts around the Great Lakes. The wood is fine-grained, frequently with a beautiful wavy figure, yellowish white to light brown in colour; it is very hard, tough and durable. Birds'-eye maple has a peculiar curly grain, and is much in request for ornamental joinery.

Strength of Timber.

The numerous tests of the strength of timber which have been made by various authorities from time to time vary so much, both as regards the conditions under which they were carried out and the results obtained, that great discretion is required in using them for any practical purpose. An important series of tests was made in 1883 and 1887 at Munich by Professor Johann Bauschinger. He reduced all the specimens submitted for test to a standard of moisture, the percentage selected being 15%. This was necessary on account of the great difference in strength found to exist between specimens cut from the same piece of timber but differing in the amount of moisture they contained.

In America, Professor J. B. Johnson made a large number of tests for the Forest Department of the Board of Agriculture of the United States between 1891 and 1895. More than 300 trees were cut down and experimented with, the species under test embracing ten different kinds of pine and five different varieties of hard-wood trees. Records were made as to the nature of the soil and climate where the trees were grown; their conditions of growth, their age and size, and the season of felling. As in the tests made by Bauschinger, the percentage of moisture contained in the wood was very carefully observed, and it was found that this amount of moisture has a very great influence upon the resisting power of the wood, the strength increasing with the dryness of the material up to 3 or 4% of moisture, at which point the greatest strength of the wood is reached. Wood in such a dry condition, however, is never found in actual practice, timber in an ordinary well-warmed and well-ventilated situation probably containing at least 10%.

One general conclusion arrived at both by Bauschinger and Johnson was that the strength is much affected by the specific gravity of the timber. In all cases the strength increases proportionately with the density of the wood. A most complete series of tests upon the physical characteristics of the hard woods of Western Australia was completed for the government of Western Australia by G. A. Julius in 1907. This work was carried out in a most thorough manner, and as many as 16,000 tests were made, the conditions of test being based upon those laid down by Johnson. The results serve to show the great value of Australian timbers, and the comparisons made with the typical timbers of many other countries emphasize the fact that the Australian woods are equal to any in the world for hardness, strength and durability.

For use under special conditions a wood suited to the particular requirements must be selected. The following is a list of the best timbers for different situations: for general construction, spruce and pine of the different varieties; for heavy constructions, pitch pine, oak (preferably of English growth), teak, jarrah; for constructions immersed in water, Baltic pine, elm, oak, teak, jarrah; for very dry situations, spruce, pines, mahogany, teak, birch, sycamore.

There are no regulations in England limiting the working stresses that may safely be placed upon timber, although in some districts the least sizes that may be used for timbers in roofs and floors are specified. In some European and other countries, however, the safe working stresses of timber used for constructional purposes are defined. The building by-laws of the municipality of Johannesburg, in South Africa, contain the following table:—

Safe Working Stresses for Timber. In tons per square inch.

Material.	Tensional.	Compressive.	Bending. Extreme Fibre Stress.
Timber	—	—	—
Fir and Pine . . .	½	½	⅓
Hardwood . . .	½	⅓	½

Note.—The compression stresses are for short struts and columns where the length does not exceed for timber 15 times the least transverse dimension, and where the ends are fixed. Where the ratio of the length to the least transverse dimension is higher, the load per square inch shall be proportionately reduced. No post of timber shall exceed in length 30 times its least transverse dimension.

TIMBER-LINE, in physical geography, the line of elevation above sea-level above which trees do not grow. In any hilly locality, which is not of too high latitude to allow of trees growing near the sea-level, this line is generally clearly marked. It varies not only with general but also with local conditions of climate, just as does the snow-line.

TIMBER-WOLF (*Canis occidentalis*), or grey wolf, an American species, or, perhaps, a geographical race of the European *C. lupus* (see WOLF). The length of good specimens is about 64 in., of which the tail forms nearly a quarter, and the range of colour is from black to white. Cattle ranchers and shepherds have established a war of extermination against this wolf and the coyote; several states offer bounties ranging from $2 to $10 on wolf-scalps. In Montana in 1901 during a month in the saddle an observer saw no wolves, which have become so scarce that the occupation of the professional wolf-hunter is almost gone. These animals are, however, far from being exterminated, the "bad lands" forming an absolutely secure refuge.

TIMBREL, or TABRET (the *tof* of the ancient Hebrews, the *deff* of Islam, the *adufe* of the Moors of Spain), the principal musical instrument of percussion of the Israelites, identical with the modern tambourine. The word timbrel is used in the Old Testament in both singular and plural form, so as to suggest that the former referred to a hoop of wood or metal over which was stretched a parchment head; while the plural was perhaps used to designate the tambourine with bells or jangles fixed at intervals in hoops. The Israelites learnt to use the timbrel during their sojourn in Egypt, and it has been suggested that as the Egyptians used it to scare away their evil spirit Typhon, the word *tof* is derived from the latter. The tabret or timbrel was a favourite instrument of the women, and was used with dances, as by Miriam, to accompany songs of victory, or with the harp at banquets and processions; it was one of the instruments used by King David and his musicians when he danced before the Ark. It was also used in the valley of Hinnom at the sacrificial rites, when human victims were "passed through the fire" to Moloch. (K. S.)

TIMBS, JOHN (1801–1875), English antiquary, was born in Clerkenwell, London, on the 17th of August 1801. He was educated at a private school at Hemel Hempstead, and in his sixteenth year apprenticed to a druggist and printer at Dorking. He had early shown literary capacity, and when nineteen began to write for the *Monthly Magazine*. A year later he became secretary to Sir Richard Phillips, its proprietor, and permanently adopted literature as a profession. He was successively editor of the *Mirror of Literature*, the *Harlequin*, the *Literary World*, and sub-editor of the *Illustrated London News*. He was also founder and first editor of *Year-Book of Science and Art*. His published works amounted to more than one hundred and fifty volumes. In 1834 he was elected a fellow of the Society of Antiquaries. He died in London on the 6th of March 1875.

TIMBUKTU (French spelling Tombouctou), chief town of the territory of Timbuktu, French West Africa, 9 m. N. of the main stream of the Niger in 16° N. and 5° W.

Timbuktu lies on a terrace formed by the southern scarp of the Sahara, about 800 ft. above sea-level, and overlooking a chain of *dhayas* or marshy hollows, fringed here and there with a few mimosas and palm thickets, amid the surrounding sandy wastes. These dhayas, which are flooded every three or four years, converting the lowland tracts between the terrace and the main stream into a labyrinth of channels and backwaters, mark the bed of a navigable creek which formerly branched from the Niger northwards to the foot of the scarp, and which in 1640 inundated a low-lying quarter of the city. It is conjectured that the main stream followed this course before it took its present easterly curve to Burrem, where it bends southwards to the coast. Here also it was probably joined at some remote period by the now dried-up Wadi Messaura from the Tuat oases south of Algeria, although the rough levels taken by Oscar Lenz and others make it uncertain whether the flow through this depression was northwards or southwards. In any case Timbuktu has been left, so to say, high and dry by the general process of desiccation going on throughout the Saharan region.

Timbuktu has been described as "the meeting point of the camel and the canoe," "the port of the Sahara in the Sudan," and (more correctly) "the port of the Sudan in the Sahara." It is a great "exchange" for the produce of North Africa and that of the rich countries south and west of the Niger. It was formerly a much larger place than it was found to be at the time of its occupation by the French in 1893–1894. Extensive ruins exist north and west of the present town. The great mosque which at one time stood in the centre of the town now lies near the western outskirts, where its high but unsightly earth tower forms a striking landmark. The mosque of Sidi Yaia (in the centre of the town) and that of Sankoré in the north-east also possess prominent towers. Two forts, built by the French and placed, one on the northern the other (Fort Bonnier) on the southern side of the town, protect the roads to the desert and the river respectively. Whereas in 1895 the town was little more than a vast ruin, under French protection the inhabitants, relieved from the fear of Tuareg oppression, set about repairing and rebuilding their houses; trade revived; new streets were built; European schools, churches and other establishments were opened.

The industries of Timbuktu—cotton-weaving, earthenware, leather-work and embroidery—are of subordinate importance, and the great bulk of the people are occupied exclusively with trade. The whole traffic of the surrounding lands converges on Timbuktu, which has a transit trade estimated at over £800,000 per annum. Considerable quantities of British and German fabrics, hardware, beads, &c., are conveyed across the Sahara from Mogador (Morocco), while two great caravans of 3000 or 4000 camels are yearly charged with salt from the Taudeni district, salt being an article which the Niger countries lack. The imports via the Sahara average about £50,000 annually, and by way of Senegal goods of equal value are received. From the south come cereals, gold, wax, ivory and coarse native cotton goods, now brought to Kabara (the port of Timbuktu) by steamers plying on the upper Niger. Cowries, the former currency (2500=5 francs), have been generally replaced by French money. It is proposed to connect the city with the Niger by a canal.

Timbuktu, which possesses some valuable Arabic manuscripts —notably the *Tarik es-Sudan*, a 17th-century history of the Sudan written by Abderrahman Sadi of Timbuktu—and is a centre of Moslem teaching, is a converging point of the chief west Sudanese and Saharan races—Arabs or Arabized Berbers to the west; Songhoi in the immediate vicinity, and thence south-eastwards along the Niger; Ireghenaten or "mixed" Tuareg southwards across the Niger as far as the Hombori Hills and in the fertile Libbako plains beyond them; Fula, Mandingos, and Bambara in and about the city; and Imoshagh (Tuareg) belonging to the Awellimiden confederation mainly to the north and east.

The local administration—preserved under French rule—is in the hands of an hereditary *kahia*, a kind of mayor, descended from one of the Ruma families (see below). The kahia, during the greater part of the 19th century, was more or less under the control of the powerful Bakhai (Backay) family, who, as "sherifs" and marabouts, were revered throughout the western Sahara.

History.—The history of Timbuktu[1] is intimately connected with that of the city of Jenné and the Songhoi Empire. The Songhoi (*q.v.*) are a negro race reported to have come to the Niger countries from the Nile valley. In the 8th century they made themselves masters of a considerable tract of country within the bend of the Niger, and built the city of Gao (*q.v.*) 200 m. in a direct line S.S.E. of Timbuktu, making it their capital. In the 11th century they were converted to Islam. Besides Gao, the Songhoi founded Jenné (*q.v.*), which early attained considerable commercial importance. Meantime (11th century) a settlement had been made at Timbuktu by Tuareg. Perceiving the advantages for trade with the north offered by this desert rendezvous, the merchants of Jenné sent agents thither (12th century), and Timbuktu shortly afterwards became known to the inhabitants of the Sahara and Barbary as the best market in which to dispose of their salt and other goods, and also for the purchase of the many commodities of the western Sudan. In the 12th or 13th century Timbuktu fell under the power of the Mandingo kings of Melle or Mali, a country lying west and south of Jenné. Its fame as a mart for gold and salt spread to Europe, "Timboutch" being marked on a Catalan map dated 1373. In 1353 it had been visited by the famous traveller Ibn Batuta. In 1434 the Tuareg made themselves masters of the city, which in 1469 was captured by the Songhoi king Sunni Ali. In the days of Sunni's successor Askia (1494–1529), who completed the conquest of Melle begun by Sunni Ali, the Songhoi empire reached its highest development, and Timbuktu rose to great splendour. The "university" of Sankoré became a chief centre of Mahommedan culture for the peoples of the western Sudan. One of the sheikhs of Sankoré, Ahmad Baba, was among the most learned of Moslems. Some of his writings are still extant. The riches of Timbuktu excited the cupidity of El Mansur, sultan of Morocco, who, in 1590, sent an army across the Sahara under an "Andalusian" Moor (that is, a Moor descended from those expelled from Spain), which captured Timbuktu (1591) and completely broke up the Songhoi empire. The Moors made Timbuktu their capital city. For about twenty years after the conquest the pasha who ruled at Timbuktu was nominated from Morocco, but the distance of the Niger countries from Marrakesh enabled this vast viceroyalty to throw off all allegiance to the sultan of Morocco.

The Niger Moors, known as *Rumas* after El Mansur's musketeers, quarrelled continually among themselves, and oppressed the negro tribes. By the end of the 18th century two hundred years of oppression had reduced Timbuktu to comparative desolation and poverty. By this time the whole country was in a state of anarchy, and in 1800 the Tuareg swooped down from the desert and captured the place. They were in turn (1813) dispossessed by the Fula, who in 1840 gave place to the Tukulor, led by El Haj Omar, the first great opponent of the extension of French influence in the Niger bend. When the French reached Timbuktu in December 1893 they found that the town had again fallen beneath the rule of the Tuareg. The townsfolk, indeed, from the time of the decay of the Ruma power being at the mercy of all comers, were content to pay tribute to each in turn and sometimes to more than one simultaneously, for which they indemnified themselves by peaceful intervals of trade whenever the land routes were open and the upper and lower reaches of the Niger clear of pirates. But at times even the short tract separating the town from Kabara was so beset with marauders that it bore the ominous name of "Ur-immandess," that is, "He (God) hears not." Little wonder then that the townsfolk, wearied by the extortions and internecine strife of their Fula and Tuareg masters, freely opened their gates to the French as soon as Lieut. Boiteux reached Kabara in command of a small flotilla.

The occupation of the town, against orders, was a daring exploit of a handful of marines. The force which "garrisoned" Timbuktu consisted of but seven Europeans and twelve Senegalese, a somewhat larger body being left with the gunboats at Kabara. On the 28th of December the Tuareg attacked the boat party, killing Naval Ensign Aube, another officer, and eighteen black sailors. Colonel T. P. E. Bonnier, who was at Mopti, 200 m. to the south-west, marched to the relief of Boiteux and entered Timbuktu without opposition on the 10th of January 1894. Leaving part of his force in the town the colonel set out with about 100 men to chastize the nomads. In the night of the 14th–15th January his camp was surprised and the colonel and nearly all his men perished. The enemy did not follow up their victory, and within a short period French rule was firmly established in Timbuktu.

Apart from some Christian captives, the place was reached during the 19th century, previous to its capture by the French, by four Europeans—Major Gordon Laing from Tripoli (1826), who was murdered by order of the Fula; René Caillié from the south (1828), Heinrich Barth from Central Sudan (1853) and Oskar Lenz from Morocco (1880). (In 1903 the French authorities placed commemorative tablets on the houses occupied by

[1] Tin-Buktu in Arabic may stand for "the well of Buktu"; in the Songhoi tongue the word means a hollow.

these four men during their stay in Timbuktu. The tablets bear simply the name of the explorer and the date of his visit.) In 1895 Felix Dubois made a stay of some duration in the town, investigating its history and that of the surrounding country. In 1904 Timbuktu became part of the colony of Upper Senegal and Niger.

The British connexion with Timbuktu may be briefly stated. Barth went to West Africa as the officially credited representative of the British government, empowered to enter into relations with the native princes. At Timbuktu he stayed under the protection of the sheikh Sidi Mahommed El Backay (Bakhai), and took back to England letters from the sheikh professing friendship with the British. In reply Lord Clarendon, secretary of state for foreign affairs, wrote a letter dated the 15th of April 1859, to El Backay, stating that "the friendship binding us shall not diminish through the centuries" and "as our government is very powerful we will protect your people who turn to us." A nephew of the sheikh went to Tripoli where he received presents for his uncle and other chieftains from the British consul, who also wrote a letter to El Backay, saying, among other things, "The English government has sent a steamer up the river which flows out of your country and has recommended those on board to make every effort to reach you." The steamer did not ascend the Niger to Timbuktu, and no further efforts appear to have been made in England to maintain political relations with Timbuktu. Moreover the power of El Backay seems not to have been so great as was believed in England, or at least did not long continue after the departure of Barth.

AUTHORITIES.—The chief original authorities are the *Tarik es-Sudan* (trans. Houdas, Paris, 1901); and Ahmad Baba's "Chronicle" (trans. Barth) in *Zeitsch. der morgenländ. Gesellsch.* ix. 826. Among medieval writers, see especially Ibn Batuta and Leo Africanus. Of early European records Barth's *Travels* are the most important. The best popular account is F. Dubois, *Timbuctoo the Mysterious* (London, 1896). Consult also H. N. Frey, *Sénégal et Soudan* (Paris, 1888); Lieut. Hourst, *The Exploration of the Niger* (London, 1898); O. Lenz, *Timbuktu* (Leipzig, 1884); W. D. Cooley, *Negroland of the Arabs* (London, 1841); A. Lebon, *Rapport de la mission au Sénégal et au Soudan* (Paris, 1898); Commandant Toutée, *Dahomé, Niger, Touareg* (Paris, 1897), *Du Dahomé au Sahara* (Paris, 1899); Lady Lugard, *A Tropical Dependency* (London, 1905). (F. R. C.)

TIME (O. Eng. *tima*, cf. Icel. *timi*, Swed. *timme*, hour, Dan. *time*; from the root also seen in "tide," properly the time of between the flow and ebb of the sea, cf. O. Eng. *getidan*, to happen, "even-tide," &c.; it is not directly related to Lat. *tempus*), the general term for the experience of duration or succession, either in whole or in part. For time in its psychological sense see SPACE AND TIME; for time in music, see RHYTHM; for the methods of reckoning time see CALENDAR; DAY; MONTH; and the articles TIME, MEASUREMENT OF, and TIME STANDARD, below. Generally in English law, where any particular time is mentioned in acts of parliament or legal instruments, it is to be defined as meaning, in Great Britain, Greenwich mean time, and in Ireland, Dublin mean time. At common law, where parties enter into legal relations, and specify their intention of being bound by any particular arbitrary system, the courts will, as a rule, give effect to their intentions.

TIME, MEASUREMENT OF. Time is measured by successive phenomena recurring at regular intervals. The only astronomical phenomenon which rigorously fulfils this condition, and the most striking one—the apparent daily revolution of the celestial sphere caused by the rotation of the earth—has from the remotest antiquity been employed as a measure of time. The interval between two successive returns of a fixed point on the sphere to the meridian is called the sidereal day; and sidereal time is reckoned from the moment when the "first point of Aries" (the vernal equinox) passes the meridian, the hours being counted from 0 to 24. Clocks and chronometers regulated to sidereal time are only used by astronomers, to whom they are indispensable, as the sidereal time at any moment is equal to the right ascension of any star just then passing the meridian. For ordinary purposes solar time is used. The solar day, as defined by the successive returns of the sun to the meridian, does not furnish a uniform measure of time, owing to the slightly variable velocity of the sun's motion and the inclination of its orbit to the equator, so that it becomes necessary to introduce an imaginary mean sun moving in the equator with uniform velocity. The equation of time is the difference between apparent (or true) solar time and mean solar time. The latter is that shown by clocks and watches used for ordinary purposes. Mean time is converted into apparent time by applying the equation of time with its proper sign, as given in the *Nautical Almanac* and other ephemerides for every day at noon. As the equation varies from day to day, it is necessary to take this into account, if the apparent time is required for any moment different from noon. The ephemerides also give the sidereal time at mean noon, from which it is easy to find the sidereal time at any moment, as 24 hours of mean solar time are equal to $24^h\ 3^m\ 56{\cdot}5554^s$ of sidereal time. About the 21st of March of each year a sidereal clock agrees with a mean time clock, but it gains on the latter $3^m\ 56{\cdot}5^s$ every day, so that in the course of a year it has gained a whole day. For a place not on the meridian of Greenwich the sidereal time at noon must be corrected by the addition or subtraction of $9{\cdot}8565^s$ for each hour of longitude, according as the place is west or east of Greenwich.

While it has for obvious reasons become customary in all civilized countries to commence the ordinary or civil day at midnight, astronomers count the day from noon, being the transit of the mean sun across the meridian, in strict conformity with the rule as to the beginning of the sidereal day. The hours of the astronomical day are also counted from 0 to 24. An international conference which met in 1884 at Washington to consider the question of introducing a universal day (see below), recommended that the astronomical day should commence at midnight, to make it coincide with the civil day. The great majority of astronomers, however, expressed themselves very strongly against this proposal, and it has not been adopted.

Determination of Time.—The problem of determining the exact time at any moment is practically identical with that of determining the apparent position of any known point on the celestial sphere with regard to one of the fixed (imaginary) great circles appertaining to the observer's station, the meridian or the horizon. The point selected is either the sun or one of the standard stars, the places of which are accurately determined and given for every tenth day in the modern ephemerides. The time thus determined furnishes the *error* of the clock, chronometer or watch employed, and a second determination of time after an interval gives a new value of the error and thereby the *rate* of the timekeeper.

The ancient astronomers, although they have left us very ample information about their dials, water or sand clocks (*clepsydrae*), and similar timekeepers, are very reticent as to how these were controlled. Ptolemy, in his *Almagest*, states nothing whatever as to how the time was found when the numerous astronomical phenomena which he records took place; but Hipparchus, in the only book we possess from his hand, gives a list of 44 stars scattered over the sky at intervals of right ascension equal to exactly one hour, so that one or more of them would be on the meridian at the commencement of every sidereal hour. H. C. F. C. Schjellerup[1] has shown that the right ascensions assumed by Hipparchus agree within about 15′ or one minute of time with those calculated back to the year 140 B.C. from modern star-places and proper motions. The accuracy which, it thus appears, could be attained by the ancients in their determinations of time was far beyond what they seem to have considered necessary, as they only record astronomical phenomena (*e.g.* eclipses, occultations) as having occurred "towards the middle of the third hour," or "about 8⅔ hours of the night," without ever giving minutes.[2] The Arabians had a

[1] "Recherches sur l'astronomie des Anciens: I. Sur le chronomètre céleste d'Hipparque," in *Copernicus: An International Journal of Astronomy*, i. 25.

[2] For astronomical purposes the ancients made use of mean-time hours—ὧραι ἰσημεριναί, *horae equinoctiales*—into which they translated all indications expressed in civil hours of varying length—ὧραι καιρικαί, *horae temporales.* Ptolemy counts the mean day from noon.

clearer perception of the importance of knowing the accurate time of phenomena, and in the year 829 we find it stated that at the commencement of the solar eclipse on the 30th of November the altitude of the sun was 7° and at the end 24°, as observed at Bagdad by Ahmed ibn Abdallah, called Habash.[1] This seems to be the earliest determination of time by an altitude; and this method then came into general use among the Arabians, who, on observing lunar eclipses, never failed to measure the altitude of some bright star at the beginning and end of the eclipse. In Europe this method was adopted by Purbach and Regiomontanus apparently for the first time in 1457 Bernhard Walther, a pupil of the latter, seems to have been the first to use for scientific purposes clocks driven by weights: he states that on the 16th of January 1484 he observed the rising of the planet Mercury, and immediately attached the weight to a clock having an hour-wheel with fifty-six teeth; at sunrise one hour and thirty-five teeth had passed, so that the interval was an hour and thirty-seven minutes. For nearly two hundred years, until the application of the pendulum to clocks became general, astronomers could place little or no reliance on their clocks, and consequently it was always necessary to fix the moment of an observation by a simultaneous time determination. For this purpose Tycho Brahe employed altitudes observed with quadrants; but he remarks that if the star is taken too near the meridian the altitude varies too slowly, and if too near the horizon the refraction (which at that time was very imperfectly known) introduces an element of uncertainty. He sometimes used azimuths, or with the large "armillary spheres" which played so important a part among his instruments, he measured hour-angles or distances from the meridian along the equator.[2] Transits of stars across the meridian were also observed with the meridian quadrant, an instrument which is alluded to by Ptolemy and was certainly in use at the Marāgha (Persia) observatory in the 13th century, but of which Tycho was the first to make extensive use. But he chiefly employed it for determining star-places, having obtained the clock error by the methods already described.

In addition to these methods, that of "equal altitudes" was much in use during the 17th century. That equal distances east and west of the meridian correspond to equal altitudes had of course been known as long as sundials had been used; but, now that quadrants, cross-staves and parallactic rules were commonly employed for measuring altitudes more accurately, the idea naturally suggested itself to determine the time of a star's or the sun's meridian passage by noting the moments when it reached any particular altitude on both sides of the meridian. But Tycho's plan of an instrument fixed in the meridian was not forgotten, and from the end of the 17th century, when Römer invented the transit instrument, the observation of transits across the meridian became the principal means of determining time at fixed observatories, while the observation of altitudes, first by portable quadrants, afterwards by reflecting sextants, and during the 19th century by portable alt-azimuths or theodolites, has been used on journeys. Since about 1830 the small transit instrument, with what is known as a "broken telescope," has also been much employed on scientific expeditions; but great caution is necessary in using it, as the difficulties of getting a perfectly rigid mounting for the prism or mirror which reflects the rays from the object glass through the axis to the eyepiece appear to be very great, for strange discrepancies in the results have often been noticed. The gradual development of astronomical instruments has been accompanied by a corresponding development in timekeepers. From being very untrustworthy, astronomical clocks are now made to great perfection by the application of the pendulum and by its compensation, while the invention of chronometers has placed a portable and equally trustworthy timekeeper in the hands of travellers.

We shall now give a sketch of the principal methods of determining time.

[1] Caussin, *Le Livre de la grande table Hakémite*, p. 100 (Paris, 1804).

[2] See his *Epistolae astronomicae*, p. 73.

In the spherical triangle ZPS between the zenith, the pole and a star the side $ZP=90°-\phi$ (ϕ being the latitude), $PS=90°-\delta$ (δ being the declination), and ZS or $z=90°$ minus the observed altitude. The angle $ZPS=t$ is the star's hour-angle or, in time, the interval between the moment of observation and the meridian passage of the star. We have then

$$\cos t = \frac{\cos z - \sin\phi\sin\delta}{\cos\phi\cos\delta},$$

which formula can be made more convenient for the use of logarithms by putting $z+\phi+\delta=2S$, which gives

$$\tan^2 \tfrac{1}{2}t = \frac{\sin(S-\phi)\ \sin(S-\delta)}{\cos S\cos(S-z)}.$$

According as the star was observed west or east of the meridian, t will be positive or negative. If α be the right ascension of the star, the sidereal time $=t+\alpha$, α as well as δ being taken from an ephemeris. If the sun had been observed the hour-angle t would be the apparent solar time. The latitude observed must be corrected for refraction, and in the case of the sun also for parallax, while the sun's semi-diameter must be added or subtracted according as the lower or upper limb was observed. The declination of the sun being variable, and being given in the ephemerides for noon of each day, allowance must be made for this by interpolating with an approximate value of the time. As the altitude changes very slowly near the meridian, this method is most advantageous if the star be taken near the prime vertical, while it is also easy to see that the greater the latitude the more uncertain the result. If a number of altitudes of the same object are observed, it is not necessary to deduce the clock error separately from each observation, but a correction may be applied to the mean of the zenith distances. Supposing n observations to be taken at the moments $T_1, T_2, T_3, \ldots$, the mean of all being T_0, and calling the z corresponding to this Z, we have

$$z_1 = Z + \frac{dZ}{dt}(T_1 - T_0) + \frac{1}{2}\frac{d^2Z}{dt^2}(T_1 - T_0)^2;$$

$$z_2 = Z + \frac{dZ}{dt}(T_2 - T_0) + \frac{1}{2}\frac{d^2Z}{dt^2}(T_2 - T_0)^2;$$

and so on, t being the hour-angle answering to T_0. As $\Sigma(T-T_0)=0$, these equations give

$$Z = \frac{z_1+z_2+z_3+\ldots}{n} - \frac{1}{2}\frac{d^2Z}{dt^2}\frac{(T_1-T_0)^2+(T_2-T_0)^2+\ldots}{n};$$

$$= \frac{z_1+z_2+z_3+\ldots}{n} - \frac{d^2Z}{dt^2}\frac{\Sigma 2\sin^2\frac{1}{2}(T-T_0)}{n}.$$

But, if in the above-mentioned triangle we designate the angles at Z and S by $180°-A$ and p, we have

$$\sin z\sin A = \cos\delta\sin t;$$
$$\sin z\cos A = -\cos\phi\sin\delta + \sin\phi\cos\delta\cos t;$$

and by differentiation

$$\frac{d^2Z}{dt^2} = \frac{\cos\phi\cos\delta\cos A\cos p}{\sin Z},$$

in which A and p are determined by

$$\sin A = \frac{\sin t}{\sin Z}\cos\delta \text{ and } \sin p = \frac{\sin t}{\sin Z}\cos\phi.$$

With this corrected mean of the observed zenith distances the hour-angle and time are determined, and by comparison with T_0 the error of the timekeeper.

The method of equal altitudes gives very simply the clock error equal to the right ascension minus half the sum of the clock times corresponding to the observed equal altitudes on both sides of the meridian. When the sun is observed, a correction has to be applied for the change of declination in the interval between the observations. Calling this interval $2t$, the correction to the apparent noon given by the observations x, the change of declination in half the interval $\Delta\delta$, and the observed altitude h, we have

$$\sin h = \sin\phi\sin(\delta-\Delta\delta) + \cos\phi\cos(\delta-\Delta\delta)\cos(t+x)$$

and $\sin h = \sin\phi\sin(\delta+\Delta\delta) + \cos\phi\cos(\delta+\Delta\delta)\cos(t-x)$,

whence, as $\cos x$ may be put $=1$, $\sin x = x$, and $\tan\Delta\delta = \Delta\delta$,

$$x = -\left(\frac{\tan\phi}{\sin t} - \frac{\tan\delta}{\tan t}\right)\Delta\delta,$$

which, divided by 15, gives the required correction in seconds of time. Similarly an afternoon observation may be combined with an observation made the following morning to find the time of apparent midnight.

The observation of the time when a star has a certain azimuth may also be used for determining the clock error, as the hour-angle can be found from the declination, the latitude and the azimuth. As the azimuth changes most rapidly at the meridian, the observation is most advantageous there, besides which it is neither necessary to know the latitude nor the declination accurately. The observed time of transit over the meridian must be corrected for the deviations of the instrument in azimuth, level and collimation. This corrected time of transit, expressed in sidereal time, should then be equal to the right ascension of the object observed, and the difference is the clock error. In observatories the determination of a clock's error (a necessary operation during a night's work with a transit circle) is generally founded on observations of four or five "clock stars," these being standard stars not near the pole, of which the absolute right ascensions have been determined with great care, besides observation of a close circumpolar star for finding the error of azimuth and determination of level and collimation error.[1]

Observers in the field with portable instruments often find it inconvenient to wait for the meridian transits of one of the few close circumpolar stars given in the ephemerides. In that case they have recourse to what is known as the method of time determination in the vertical of a pole star. The alt-azimuth is first directed to one of the standard stars near the pole, such as α or δ Ursae Minoris, using whichever is nearest to the meridian at the time. The instrument is set so that the star in a few minutes will cross the middle vertical wire in the field. The spirit-level is in the meantime put on the axis and the inclination of the latter measured. The time of the transit of the star is then observed, after which the instrument, remaining clamped in azimuth, is turned to a cock star and the transit of this over all the wires is observed. The level is applied again, and the mean of the two results is used in the reductions. In case the collimation error of the instrument is not accurately known, the instrument should be reversed and another observation of the same kind taken. The observations made in each position of the instrument are separately reduced with an assumed approximate value of the error of collimation, and two equations are thus derived from which the clock error and correction to the assumed collimation error are found. This use of the transit or alt-azimuth out of the meridian throws considerably more work on the computer than the meridian observations do, and it is therefore never resorted to except when an observer during field operations is pressed for time. The formulae of reduction as developed by Hansen in the *Astronomische Nachrichten* (xlviii. 113 seq.) are given by Chauvenet in his *Spherical and Practical Astronomy* ii. 216 seq. (4th ed., Philadelphia, 1873) The subject has also been treated at great length by Döllen in two memoirs: *Die Zeitbestimmung vermittelst des tragbaren Durchgangsinstrument im Verticale des Polarsterns* (4to, St Petersburg, 1863 and 1874).

Longitude.—Hitherto we have only spoken of the determination of local time. But in order to compare observations made at different places on the surface of the earth a knowledge of their difference of longitude becomes necessary, as the local time varies proportionally with the longitude, one hour corresponding to 15°. Longitude can be determined either geodetically or astronomically. The first method supposes the earth to be a spheroid of known dimensions. Starting from a point of departure of which the latitude has been determined, the azimuth from the meridian (as determined astronomically) and the distance of some other station are measured. This second station then serves as a point of departure to a third, and by repeating this process the longitude and latitude of places at a considerable distance from the original starting-point may be found. Referring for this method to the articles EARTH, FIGURE OF THE, and GEODESY, we shall here only deal with astronomical methods of determining longitude.

The earliest astronomer who determined longitude by astronomical observations seems to have been Hipparchus, who chose for the first meridian that of Rhodes, where he observed; but Ptolemy adopted a meridian laid through the "Insulae Fortunatae" as being the farthest known place towards the west.[2] When the voyages of discovery began the peak of Teneriffe was frequently used as a first meridian, until a scientific congress, assembled by Richelieu at Paris in 1630, selected the island of Ferro for this purpose. Although various other meridians (*e.g.* that of Uraniburg and that of San Miguel, one of the Azores, 29° 25′ W. of Paris) continued to be used for a long time, that of Ferro, which received the authorization of Louis XIII. on the 25th of April 1634, gradually superseded the others. In 1724 the longitude of Paris from the west coast of Ferro was found by Louis Feuillée, who had been sent there by the Paris Academy, to be 20° 1′ 45″; but on the proposal of Guillaume de Lisle (1675–1726) the meridian of Ferro was assumed to be exactly 20° W. of the Paris observatory. Modern maps and charts generally give the longitude from the observatory of either Paris or Greenwich according to the nationality of the constructor; the Washington meridian conference of 1884 recommended the exclusive use of the meridian of Greenwich. On the same occasion it was also recommended to introduce the use of a "universal day," beginning for the whole earth at Greenwich midnight, without interfering with the use of local time. This proposal has, however, not been adopted, but instead of it the system of "Standard Time" (see below) has been accepted in most countries. Already in 1883 four standard meridians were adopted in the United States, 75°, 90°, 105°, 120° west of Greenwich, so that clocks showing "Eastern, Central, Mountain or Pacific time" are exactly five, six, seven or eight hours slower than a Greenwich mean time clock. In Europe Norway, Sweden, Germany, Austro-Hungary, Switzerland and Italy use mid-European time, one hour fast on Greenwich. In South Africa the legal time is two hours fast on Greenwich, &c.[3]

[1] The probable error of a clock correction found in this way from one star is about $\pm 0{\cdot}04^s$, if a modern transit circle and chronograph is used.

[2] This was first done early in the 2nd century by Marinus of Tyre.

The simplest method for determining difference of longitude consists in observing at the two stations some celestial phenomenon which occurs at the same absolute moment for the whole earth. Hipparchus pointed out how observations of lunar eclipses could be used in this way, and for about fifteen hundred years this was the only method available. When Regiomontanus began to publish his ephemerides towards the end of the 15th century, they furnished other means of determining the longitude. Thus Amerigo Vespucci observed on the 23rd of August 1499, somewhere on the coast of Venezuela, that the moon at $7^h\ 30^m$ p.m. was 1°, at midnight 5½° east of Mars; from this he concluded that they must have been in conjunction at $6^h\ 30^m$, whereas the ephemeris announced this to take place at midnight. This gave the longitude of his station as roughly equal to 5½ hours west of Cadiz. The instruments and the lunar tables at that time being very imperfect, the longitudes determined were very erroneous. The invention of the telescope early in the 17th century made it possible to observe eclipses of Jupiter's satellites; but there is to a great extent the same drawback attached to these as to lunar eclipses: that it is impossible to observe with sufficient accuracy the moments at which they occur.

Eclipses of the sun and occultations of stars by the moon were also much used for determining longitude before the invention of chronometers and the electric telegraph offered better means for fixing the longitude of observatories. These methods are now hardly ever employed except by travellers, as they are very inferior as regards accuracy. For the necessary formulae see Chauvenet's *Spherical and Practical Astronomy*, i. 518–542 and 550–557.

We now proceed to consider the four methods for finding the longitudes of fixed observatories, viz. by (1) moon culminations, (2) rockets or other signals, (3) transport of chronometers and (4) transmission of time by the electric telegraph.

1. *Moon Culminations.*—Owing to the rapid orbital motion of the moon the sidereal time of its culmination is different for different meridians. If, therefore, the rate of the moon's change of right ascension is known, it is easy from the observed time of culmination at two stations to deduce their difference of longitude. In order to be as much as possible independent of instrumental errors, some standard stars nearly on the parallel of the moon are observed at the two stations; these "moon-culminating stars" are given in the ephemerides in order to secure that both observers take the same stars. As either the preceding or the following limb, not the centre, of the moon is observed, allowance must be made for the time the semi-diameter takes to pass the meridian and for the change of right ascension during this time. This method was proposed by Pigott towards the end of the 18th century, and has been much used; but, though it may be very serviceable on journeys and expeditions to distant places where the chronometric and telegraphic methods cannot be employed, it is not accurate enough for fixed observatories. Errors of four to six seconds of time have frequently been noticed in longitudes obtained by this method from a limited number of observations: *e.g.* $4{\cdot}47^s$ in the case of the Madras observatory.[4]

[3] For a complete list of the standard times adopted in all countries see *Publications of the U.S. Naval Observatory*, vol. iv. app. iv. (Washington, 1906).

[4] For field stations the photographic method first proposed and carried out by Captain Hills, R.E., in 1895, may be found advantageous. A camera of rigid form is set up and some instantaneous moon-exposures are made, after which the camera is left untouched until a few exposures can be made of a couple of bright stars, which are allowed to impress their trails on the plate for 15 or 30 seconds. If the exact local time of each exposure be known, such a plate gives the data necessary for computing the moon's position at the time of each exposure, and hence the Greenwich time and longitude (*Memoirs Roy. Astr. Soc.*, 1899, liii. 117).

2. *Signals.*—In 1671 Picard determined the difference of longitude between Copenhagen and the site of Tycho Brahe's observatory by watching from the latter the covering and uncovering of a fire lighted on the top of the observatory tower at Copenhagen. Powder or rocket signals have been in use since the middle of the 18th century; they are nowadays never used for this purpose, although several of the principal observatories of Europe were connected in this manner early in the 19th century.[1]

3. *Transport of Chronometers.*—This means of determining longitude was first tried in cases where the chronometers could be brought the whole way by sea, but the improved means of communication on land led to its adoption in 1828 between the observatories at Greenwich and Cambridge, and in the following years between many other observatories. A few of the more extensive expeditions undertaken for this object deserve to be mentioned. In 1843 more than sixty chronometers were sent sixteen times backwards and forwards between Altona and Pulkowa, and in 1844 forty chronometers were sent the same number of times between Altona and Greenwich. In 1844 the longitude of Valentia on the south-west coast of Ireland was determined by transporting thirty pocket chronometers via Liverpool and Kingstown and having an intermediate station at the latter place. The longitude of the United States naval observatory has been frequently determined from Greenwich. The following results will give an idea of the accuracy of the method.[2]

Previous to 1849, 373 chronometers . . .	$5^h\ 8^m\ 12{\cdot}52^s$
Expedition of 1849, Bond's discussion . .	$11{\cdot}20^s$
,, ,, Walker's ,, . . .	$12{\cdot}06^s$
,, ,, Bond's second result .	$12{\cdot}26^s \pm 0{\cdot}20^s$
,, 1855, 52 chronometers, 6 trips, Bond	$13{\cdot}49^s \pm 0{\cdot}19^s$

The value now accepted from the telegraphic determination is $5^h\ 8^m\ 12{\cdot}09^s$. The probable errors of the results for Pulkowa-Altona and Altona-Greenwich were supposed to be $\pm\ 0{\cdot}039^s$ and $\pm 0{\cdot}042^s$. It is of course only natural that the uncertainty of the results for the transatlantic longitude should be much greater, considering the length of time which elapsed between the rating of the chronometers at the observatories of Boston, Cambridge Massachusetts) and Liverpool. The difficulty of the method consists in determining the "travelling rate." Each time a chronometer leaves the station A and returns to it the error is determined, and consequently the rate for the time occupied by the journeys from A to B and from B to A and by the sojourn at B. Similarly a rate is found by each departure from and return to B, and the time of rest at A and B is also utilized for determining the stationary rate. In this way a series of rates for overlapping intervals of time are found, from which the travelling rates may be interpolated. It is owing to the uncertainty which necessarily attaches to the rate of a chronometer during long journeys, especially by land, where they are exposed to shaking and more or less violent motion, that it is desirable to employ a great number. It is scarcely necessary to mention that the temperature correction for each chronometer must be carefully investigated, and the local time rigorously determined at each station during the entire period of the operations.

4. *Telegraphic Determination of Longitude.*—This was first suggested by the American astronomer S. C. Walker, and owed its development to the United States Coast Survey, where it was employed from about 1849. Nearly all the more important public observatories have now been connected in this way on the continent of Europe, chiefly at the instigation of the "Europäische Gradmessung," while the determinations in connexion with the transits of Venus and those carried out in recent years by the American, French, British and Colonial governments have completed the circuit of the greater part of the globe. The telegraphic method compares the local time at one station with that at the other by means of electric signals. If a signal is sent from the eastern station A at the local time T, and received at the western station B at the local time T_1, then, if the time taken by the current to pass through the wire is called z, the difference of longitude is

$$\lambda = T - T_1 + x,$$

and similarly, if a signal is sent from B at the time T_2 and received at A at T_3, we have $\lambda = T_3 - T_2 - x$,
from which the unknown quantity x can be eliminated.

The operations of a telegraphic longitude determination can be arranged in two ways. Either the local time is determined at both stations and the clocks are compared by telegraph, or the time determinations are marked simultaneously on the two chronographs at the two stations, so that further signals for clock comparison are unnecessary. The first method has to be used when the telegraph is only for a limited time each night at the disposal of the observers, or when the climatic conditions at the two stations are so different that clear weather cannot often be expected to occur at both simultaneously, also when the difference of longitude is so considerable that too much time would be lost at the eastern station waiting for the arrival of the transit record of one star from the western station before observing another star. The independent time determination also offers the advantage that the observations may be taken either by eye and ear or by the chronograph, but as the observations made with the chronograph are somewhat more accurate than those made by eye and ear, the chronograph should be used wherever possible. This method is the one generally adopted. The method of simultaneous registration at both stations of transits of the same stars has one advantage. Each transit observed at both stations furnishes a value of the difference of longitude, so that the final result is less dependent on the clock rate than in the first method, which necessitates the combination of a series of clock errors determined during the night to form a value of the clock error for the time when the exchange of signals took place. When using this method it is advisable to select the stars in such a manner that only one station at a time is at work, so that the intensity of the current can be readjusted (by means of a rheostat) between every despatch and receipt of signals. This attention to the intensity of the current is necessary whatever method is employed, as the constancy of the transmission time (x in the above equations) chiefly depends on the constancy of the current. The probable error of a difference of longitude deduced from one star appears to be[3]

for eye and ear transits $\pm 0{\cdot}08^s$,
for chronograph transits $\pm 0{\cdot}07^s$;

while the probable error of the final result of a carefully planned and well executed series of telegraphic longitude operations is generally between $\pm 0^s{\cdot}010$ and $\pm 0{\cdot}020^s$.

Wireless telegraphy was for the first time employed in 1906 in a determination of the difference of longitude between Potsdam and Brocken, the signals being sent from Nauen, 32 km. from the former and 183 km. from the latter station. The resulting clock-differences were found to be quite independent of the energy of the electric waves. Wireless telegraphy will no doubt in future be much used in places where it may be desirable to determine the longitudes of a number of stations at the same time.

It is evident that the success of a determination of longitude depends to a very great extent on the accurate determination of time at the two stations, and great care must therefore be taken to determine the instrumental errors repeatedly during a night's work. But in addition to the uncertainty which enters into the results from the ordinary errors of observation, there is another source of error which becomes of special importance in longitude work, viz. the so-called personal error. The discovery of the fact that all observers differ more or less in their estimation of the time when a star crosses one of the spider lines in the transit instrument was made by F. W. Bessel in 1820;[4] and, as he happened to differ fully a second of time from several other observers, this remarkably large error naturally caused the phenomenon to be carefully examined. Bessel also suggested what appears to be the right explanation, viz. the co-operation of two senses in observing transits by eye and ear, the ear having to count the beats of the clock while the eye compares the distance of the star from the spider line at the last beat before the transit with the distance at the first beat after it, thus estimating the fraction of second at which the transit took place. It can easily be conceived that one person may first hear and then see, while to another these sensations take place in the reverse order; and to this possible source of error may be added the sensible time required by the transmission of sensations through the nerves to the brain and for the latter to act upon them. As the chronographic method of observing dispenses with one sense (that of hearing) and merely requires the watching of the star's motion and the pressing of an electric key at the moment when the star is bisected by the thread, the personal errors should in this case be much smaller than when the eye and ear method is employed. And it is a fact that in the former method there have never occurred errors of between half and a whole second such as have not infrequently appeared in the latter method.

In transit observations generally this personal error does not cause any inconvenience, so long as only one observer is employed at a time, and unless the amount of the error varies with the magnitude of the star (which is often the case); but when absolute time has to be determined, as in longitude work, the full amount of the personal equation between the two observers must be carefully ascertained and taken into account. And an observer's error has often been found to vary very considerably not only from year to year but even within much shorter intervals; the use of a new instrument, though perhaps not differing in construction from the accustomed one, has also been known to affect the personal error. For a number of years this latter circumstance was coupled with another which seemed perfectly incomprehensible, the personal error appearing to vary with the reversal of the instrument, that is, with the position of the illuminating lamp east or west. But in 1869–1870 Hirsch noticed during the longitude operations in Switzerland that this was

[1] For instance, Greenwich and Paris in 1825 (*Phil. Trans.*, 1826). The result, $9^m\ 21{\cdot}6^s$, is only about $0{\cdot}6^s$ too great.

[2] Gould, *Transatlantic Longitude*, p. 5 (Washington, 1869).

[3] Albrecht, *Bestimmung von Längendifferenzen mit Hülfe des electrischen Telegraphen*, p. 80 (4to Leipzig, 1869).

[4] Maskelyne had in 1795 noticed that one of his assistants observed transits more than half a second later than himself, but this was supposed to arise from some wrong method of observing adopted by the assistant, and the matter was not further looked into.

caused by a shifting of the reflector inside the telescope, by means of which the field is illuminated, which produced an apparent shifting of the image of the spider lines, unless the eyepiece was very accurately focused for the observer's sight. The simplest and best way to find the equation between two observers is to let one observe the transits of stars over half the wires in the telescope, and the other observe the transits over the remainder, each taking care to refocus the eyepiece for himself in order to avoid the above-mentioned source of error. The single transits reduced to the middle wire give immediately the equation; and, in order to eliminate errors in the assumed wire-intervals, each observer uses alternately the first and the second half of the wires. In longitude work, the two observers generally after the completion of a certain number of nights' work exchange stations and commence a new set of observations; the mean of the two results thus obtained should be free from the effect of personal error, provided that the errors of both observers have remained constant the whole time. It is therefore advisable to let the observers compare themselves, at the beginning, middle and end of the operations, and, if possible, at both the instruments employed. A useful check on the results is afforded by simultaneous experiments with one of the instruments contrived by C. Wolf, Kaiser and others, by which the absolute personal error of an observer can be determined. Though differing much in detail, these instruments are all constructed on the same principle: an artificial star (a lamp shining through a minute hole in a screen mounted on a small carriage moved by clockwork) passes in succession across a number of lines drawn on oiled paper, while an electric contact is made at the precise moment when the star is bisected on each line by the carriage passing a number of adjustable contact makers. The currents thus made register the transits automatically on a chronograph, while the observer, viewing the apparatus through his telescope, can observe the transits in the usual manner either by eye and ear or by chronograph, thus immediately finding his personal error. These contrivances have sometimes been used to educate pupils learning to observe, and experience has shown that a considerable personal error can be generally somewhat diminished through practice. By using Repsold's self-registering micrometer, which enables the observer to follow the motions of the star with a movable vertical wire which automatically registers its passage over certain fixed points in the eyepiece, the effect of personal error is almost completely eliminated. In the determination of the difference of longitude between Potsdam and Greenwich in 1903 the two observers with their instruments exchanged stations in the middle of the operations, and the sum of their personal and instrumental equation was $0{\cdot}000^s$ with a probable error of $\pm 0{\cdot}003^s$.

LITERATURE.—General treatises on spherical astronomy, such as Brünnow's *Lehrbuch der sphärischen Astronomie* (3rd ed., Berlin, 1871; trans. into English and several other languages) and Chauvenet's *Manual*, treat very fully of the numerous methods of determining time by combination of altitudes or azimuths of several stars. For telegraphic longitude work see the *Publicationen des kön. preussischen geodätischen Instituts*; the *Reports* of the United States Coast and Geodetic Survey; vol. ix. of the *Account of the Great Trigonometrical Survey of India*; and *Report of the Chief Astronomer, 1905* (Ottawa, 1906), which gives a useful review of recent longitude work in the Pacific and adjacent countries. On personal errors see Dreyer, *Proc. Roy. Irish Acad.* (1876), 2nd series, vol. ii. p. 484, and "Recherches sur l'équation personelle par M. F. Gonnesiat" in the *Trav. de l'observ. de Lyon* (1892), vol. ii. (J. L. E. D.)

TIME, STANDARD. Local time is determined by the relation of the meridian of a place to the sun. Noon at any place is defined as the moment when either the true or mean sun passes the meridian of that place, according as apparent or mean time is used. Practically, the use of mean time is now universal, so that we may regard the mean sun as that by which noon is determined. As the earth revolves, all its meridians are brought under the sun in succession or, relative to the earth, noon continually travels around the earth, making the circuit in twenty-four hours. It follows that noon, and therefore any other hour of the day, is later by four minutes for every degree of longitude towards the west, so that a watch carried east or west will be found to deviate from local time by an amount proportional to the change of longitude. Before the time of railways this deviation was not productive of inconvenience. But when railway travelling became common, train schedules had to be more exact than those of a mail coach, and the traveller was rapidly carried to places where the local time continually deviated from that shown by his watch. The use of such time thus had to be modified in places where intercommunication with others of a different longitude was frequent. Thus arose a practice on the part of railways of using the time of some central or important city on its line for all places not too distant, which time would naturally be adopted by the inhabitants of the region through which it passed. For a similar reason, in countries which did not extend through a large fraction of an hour of longitude, it was natural to use the time of the capital throughout all or a large part of its extent. Thus Greenwich time has long been in use throughout England, and all the railways of France are run by Paris time. But inconvenience was still unavoidable in passing from one country to another, or in travelling through long stretches in the same country. The inconvenience was especially felt in the United States, where every railway, and even every long stretch of several great railways, had its own time system. Thus it happened not infrequently that in a single station clocks would be found set to the time of three different meridians, one for the road toward the east, another for the road toward the west, and a third for the meridian of the place, or local use.

A device now being generally adopted to do away with this confusion was planned in 1878–1879 by Mr (afterwards Sir) Sandford Fleming, and published in the *Journal of the Canadian Institute of Toronto* for 1879. On the initiative of this organization, Mr Fleming's proposals were officially communicated to the leading governments of the world with a view of securing an international unification of the method of designating the hour of the day for common use. Naturally connected with the proposal was that of a prime meridian, from which all longitudes should be reckoned. United States invited an international conference, which was held in Washington in 1884, for the purpose of proposing a standard meridian to which longitudes and times should be referred.

Before this conference was called the railway managers of the United States, after long discussion, adopted the system. Its fundamental idea was that twenty-four standard meridians should be established 15° apart in longitude, starting from the meridian of Greenwich and extending round the globe. Then on each meridian the local time would differ from Greenwich time by some entire number of hours. At every point of the globe the time to be adopted for common use was that of the nearest standard meridian. These meridians would therefore mark the central lines of twenty-four zones, within each of which the time to be adopted would be uniform, but which would change by an hour on passing from one zone into another. The inhabitants of each zone naturally use the time of the zone instead of their local time, the maximum difference between the two being half an hour.

When the system was first established in the United States a delicate legal question arose as to whether the business of banks and courts should be legally adjusted to the new time. This was soon settled by state laws making the standard time legal within the limits of each zone. A similar system is being adopted in Europe, the standard meridians being those of 15°, 30°, &c., east of Greenwich. France, however, still adheres to Paris time,[1] but Belgium and Holland use Greenwich time, and Switzerland, Italy and central Germany use the time of 15° E., and therefore one hour in advance of that of Greenwich. This is termed mid-European time.

The system we have described is that adopted for the purposes of the railways and of daily life. For scientific and for some international purposes yet other modifications are desirable. An important distinction must be made between the cases in which convenience requires that the time have some relation to the hour of the day, and those where no such relation is required. The former is the case in designating acts or occurrences which depend upon our daily routine of rest and wakefulness. But if nothing is necessary except the designation of some moment of absolute time, irrespective of our daily routine of life, then only a single measure for the whole world is necessary. At the Washington Meridian Conference of 1884 it was proposed that Greenwich time should be adopted as a standard for the whole world in all matters of this class, especially in astronomical practice and in cable despatches. But this system does not seem to have been extensively adopted outside of astronomy, the

[1] A bill adopting Greenwich time in France, which had already passed the Chamber of Deputies, was favourably reported on in the Senate in December 1910.

cultivators of which are most accustomed to the conversion of local into standard or Greenwich time. An unavoidable inconvenience associated with the system is the uncertainty in many cases whether local or Greenwich mean time is understood. This must be especially the case with magnetic and seismic phenomena, the designation of which should be uniform for the whole earth; at present, however, we cannot invariably expect local observers to convert their observations from local into Greenwich mean time.

Associated with this question is that of the moment when the day should begin, or from which the hours should be counted. The civil division of the day into a.m. (*ante meridiem*, before mid-day) and p.m. (*post meridiem*, after mid-day), now practically universal in household and ordinary civil life, is impracticable for scientific purposes, where a count of the hours from 0 up to 24 is necessary. In railway schedules the necessity of distinguishing a.m. from p.m. when our civil time is used is found so troublesome that in some countries, especially Italy and Canada, the 24-hour system is used. Hours after noon are there designated as 13, 14, &c., up to midnight, at which moment a new day begins. On the other hand, with some few exceptions, astronomers have almost from time immemorial begun their day at noon, and navigators have very generally adopted the same practice, but for a quite different reason. In astronomy the day begins at noon for two reasons of convenience. One is that as the day is fixed by the transit of the sun over the meridian, it is more natural to start the count of the hours from this moment than from that when the sun is on the invisible antimeridian at midnight. This practice also coincides with that of counting the hours of sidereal time from the transit of the vernal equinox, and leads to the simple rule that the local mean time is equal to the hour angle of the mean sun. The other reason is that, as the astronomer makes most of his observations at night, and often after midnight, it is inconvenient to begin a new day at the latter hour. This consideration is however reversed in day observations, especially those on the sun, but these are few in number.

Navigators began the day at noon because their latitude is determined by observations of the sun, while the longitude is also generally determined during the daytime. Thus, in doing the " day's work " in the log, the position of the ship was always computed for noon. Such being the case, it was found more convenient to begin the count of a new day at this hour, to be continued through the night until the following noon. But the navigator's count of days was one day in advance of that of the astronomers; for example, March the 10th, astronomical time, begins on the 10th day of March at noon, and this count continues until noon of the day following, so that the forenoon of March the 11th, civil time, is still March the 10th, astronomical time. But the navigator begins March the 11th at noon on March the 10th. This difference is worthy of mention because a widespread misapprehension exists that the navigator was forced to count his days from noon owing to the adoption of the same system in the *Nautical Almanac*. The fact is that the practice of the navigator, like that of the astronomer, was adopted purely for his own convenience, and for the reasons just set forth. It is, however, being changed so as to conform to civil time, but as yet no general law prescribes the change.

At the Meridian Conference of 1884, it was proposed that the practice of beginning the day at midnight should be adopted universally in astronomy and navigation, and that the hours should be counted from that moment in all the nautical and astronomical ephemerides. The question of adopting this system became a subject of international correspondence. The views of the directors of the astronomical ephemerides, so far as elicited, were strongly against the change. The considerations which determined them were the confusion which the change would introduce into the tables and the count of time in the ephemerides, including the relation of sidereal and solar time; the unavoidable doubt as to whether the one or the other system was used in astronomical publications; and the danger of placing in the hands of the navigator an ephemeris in which the hours should have a different meaning from that to which he was accustomed. On the other hand, the reasons of convenience which led to the practice of beginning the day at noon still continued, so that nothing could be shown to counterbalance these drawbacks. Still, in works to be used by the public, especially almanacs and other astronomical annuals, it is necessary to convert astronomical into civil time. This must continue to be done, but offers no difficulty to the authors of such works, who are acquainted with the difference, nor to the public, which has no interest in the ephemerides and measures of time used by the professional astronomer. (S. N.)

TIME BARGAINS, a financial or commercial term for operations in securities or commodities which are to be completed at a future date, as opposed to bargains which are settled immediately. (See MARKET.)

TIMGAD, a ruined city 23 m. S.E. of Batna in the department of Constantine, Algeria. Timgad, the Thamugas of the Romans, was built on the lower slopes of the northern side of the Aures Mountains, and was situated at the intersection of six roads. It was traversed by two main streets, the Cardo Maximus running north and south, and the Decumanus Maximus east and west. The residential part of the town was on a lower level than the capitol and most of the other public buildings. The ruins of the capitol occupy a prominent position in the south-west of the city. Some of the columns of the façade (which are of the Corinthian order and 45 ft. high) have been re-erected. The dimensions of the capitol correspond with those of the Pantheon at Rome. Immediately north of the capitol are the remains of a large market; to the east are the ruins of the forum, basilica and theatre. The auditorium of the theatre, which held nearly 4000 persons, is complete. A little west of the theatre are baths, containing paved and mosaic floors in perfect preservation. Ruins of other and larger thermae are found in all four quarters of the city, those on the north being very extensive. Across the Decumanus Maximus just north-east of the market is the arch of Trajan—still erect, and restored in 1900. The arch is of the Corinthian order, and has three openings, the central one being 11 ft. wide. Each façade has four fluted columns 19 ft. high. The chief material used in building the arch was sandstone. The fluted columns are of fine white limestone and smaller columns are of coloured marble. At the other (eastern) end of the street are the remains of another triumphal arch. West of the capitol are the ruins of a large church, a square building with circular apse, built in the 7th century. There are also remains of six other churches. About 400 yds. south of the city, the walls nearly entire, is a ruined citadel, a quadrangular building 360 ft. by 295 ft., with eight towers. It was built (or rebuilt) by the Byzantine army in the 6th century. Near the northern thermae is the house of the director of the excavations and a museum containing small objects found in the ruins.

Numerous inscriptions have been found on the ruins, and from them many events in the history of Thamugas have been learnt. In the year A.D. 100 the emperor Trajan gave orders to build a city on the site of a fortified post on the road between Theveste and Lambaesis. This city, called Colonia Marciana Trajana Thamugas (Marciana in honour of Trajan's sister) appears from the inscriptions to have been completed, as far as the principal buildings were concerned, in seventeen years. A legion of Parthian veterans was stationed in the newly founded city. From the time of its foundation to the 4th century Thamugas seems to have enjoyed a peaceful and prosperous existence. Numerous inscriptions testify to the manner of life of the citizens. In the 3rd century Thamugas became a centre of Christian activity, and in the next century espoused the cause of the Donatists. The city declined in importance after the Vandal invasion in the 5th century, and was found in a ruinous condition by the Byzantine general Solomon, who occupied it A.D. 535. It is believed that the Berbers from the neighbouring mountains destroyed the city, hoping thus to prevent it being used as a stronghold from which to harry them. Thamugas was, however, repeopled, and in the 7th century was a Christian city. After the defeat of Gregorius, governor of Africa, by the Arabs in 647, Thamugas passes from history. After centuries of neglect James Bruce, the African traveller, visited the spot (1765), made careful drawings of the monuments and deciphered some of the inscriptions. Bruce was followed, more than a century later (1875), by Sir R. Lambert Playfair, British consul-general at Algiers, and soon afterwards (1875–1876) Professor Masqueray published a report on the state of the ruins. Since 1881 Thamugas has been systematically explored, and the ruins excavated under the direction of the *Service des monuments historiques*. Among the objects discovered are a series of standard measures—five cavities hollowed out of a stone slab.

Seventeen miles west of Timgad, on the site of the Roman city Lambaesis, is Lambessa (*q.v.*).

See G. Boeswillwald, R. Cagnat and A. Ballu, *Timgad, une cité africaine sous l'empire romain*; and A. Ballu, *Guide illustré de Timgad* (Paris, 1903).

TIMOCREON, of Ialysus in Rhodes, Greek lyric poet, flourished about 480 B.C. During the Persian wars he had been banished on suspicion of "medism." Themistocles had promised to procure his recall, but was unable to resist the bribes of Timocreon's adversaries and allowed him to remain in exile. Timocreon thereupon attacked him most bitterly (see Plutarch, *Themistocles*, 21); and Simonides, the friend of Themistocles, retorted in an epigram (*Anth. Pal.* vii. 348). Timocreon was also known as a composer of *scolia* (drinking-songs) and, according to Suïdas, wrote plays in the style of the old comedy. His gluttony and drunkenness were notorious, and he was an athlete of great prowess.

TIMOLEON (*c.* 411–337 B.C.), of Corinth, Greek statesman and general. As the champion of Greece against Carthage he is closely connected with the history of Sicily, especially Syracuse (*q.v.*). When his brother Timophanes, whose life he had saved in battle, took possession of the acropolis of Corinth and made himself master of the city, Timoleon, after an ineffectual protest, tacitly acquiesced while the friends who accompanied him put Timophanes to death. Public opinion approved his conduct as patriotic; but the curses of his mother and the indignation of some of his kinsfolk drove him into retirement for twenty years. In 344 envoys came from Syracuse to Corinth, to appeal to the mother-city for relief from the intestine feuds from which the Syracusans and all the Greeks of Sicily were suffering. Carthage too, their old and bitter foe, was intriguing with the local despots. Corinth could not refuse help, though her chief citizens declined the responsibility of attempting to establish a settled government in the factious and turbulent Syracuse. Timoleon, being named by an unknown voice in the popular assembly, was chosen by a unanimous vote to undertake the mission, and set sail for Sicily with a few of the leading citizens of Corinth and a small troop of Greek mercenaries. He eluded a Carthaginian squadron and landed at Tauromenium (Taormina), where he met with a friendly reception. At this time Hicetas, tyrant of Leontini, was master of Syracuse, with the exception of the island of Ortygia, which was occupied by Dionysius, still nominally tyrant. Hicetas was defeated at Adranum, an inland town, and driven back to Syracuse. In 343 Dionysius surrendered Ortygia on condition of being granted a safe conduct to Corinth. Hicetas now received help from Carthage (60,000 men), but ill-success roused mutual suspicion; the Carthaginians abandoned Hicetas, who was besieged in Leontini, and compelled to surrender. Timoleon was thus master of Syracuse. He at once began the work of restoration, bringing new settlers from the mother-city and from Greece generally, and establishing a popular government on the basis of the democratic laws of Diocles. The citadel was razed to the ground, and a court of justice erected on its site. The amphipolos, or priest of Olympian Zeus, who was annually chosen by lot out of three clans, was invested with the chief magistracy. The impress of Timoleon's reforms seems to have lasted to the days of Augustus. Hicetas again induced Carthage to send (340–339) a great army (70,000), which landed at Lilybaeum (Marsala). With a miscellaneous levy of about 12,000 men, most of them mercenaries, Timoleon marched westwards across the island into the neighbourhood of Selinus and won a great and decisive victory on the Crimissus. The general himself led his infantry, and the enemy's discomfiture was completed by a blinding storm of rain and hail. This victory gave the Greeks of Sicily many years of peace and safety from Carthage. Carthage made, however, one more effort and despatched some mercenaries to prolong the conflict between Timoleon and the tyrants. But it ended (338) in the defeat of Hicetas, who was taken prisoner and put to death; by a treaty the dominion of Carthage in Sicily was confined to the west of the Halycus (*Platani*). Timoleon then retired into private life without assuming any title or office, though he remained practically supreme, not only at Syracuse, but throughout the island. Notwithstanding the many elements of discord Sicily seems to have been during Timoleon's lifetime tranquil and contented. He became blind some time before his death, but persisted in attending the assembly and giving his opinion, which was usually accepted as a unanimous vote. He was buried at the cost of the citizens of Syracuse, who erected a monument to his memory in their market-place, afterwards surrounded with porticoes, and a gymnasium called Timoleonteum.

Lives by Plutarch and Cornelius Nepos; see also Diod. Sic. xvi. 65–90; monograph by J. F. Arnoldt (1850), which contains an exhaustive examination of the authorities; also SICILY: *History*; and SYRACUSE, with works quoted.

TIMOMACHUS, a Greek painter of the 1st century B.C. He was noted especially for two pictures, one of which represented Ajax during his madness, the other Medea meditating the slaying of her children. Both of these works were remarkable for their power of expression, especially in the face, and so belong to the latest phase of Greek art. Of the Medea we may form some notion from paintings found at Pompeii, representing that heroine standing with a sheathed sword in her hand, and watching the children at play (Helbig, *Wandgemälde Campaniens*, Nos. 1262–1265).

TIMON, of Athens, the noted misanthrope, celebrated in Shakespeare's play, lived during the Peloponnesian War. He is more than once alluded to by Aristophanes and other comedians. Plutarch introduces a short account of his life in his biography of Mark Antony (ch. 70), who built a retreat called Timonium (Strabo xvii. 794) at Alexandria. Timon also gave his name to one of Lucian's dialogues. Shakespeare probably derived his knowledge of Timon mainly from Plutarch; but the Timon of Shakespeare so resembles the Timon of Lucian that Shakespeare (or whoever wrote the first sketch of the play) may have had access to the dialogue.

TIMON (*c.* 320–230), of Phlius, Greek sceptic philosopher and satirical poet, a pupil of Stilpo the Megarian and Pyrrho of Elis. Having made a fortune by teaching and lecturing in Chalcedon he spent the rest of his life chiefly at Athens, where he died. His writings (Diogenes Laërtius, ix. ch. 12) were numerous both in prose and in verse: besides the Σίλλοι, he is said to have written epic poems, tragedies, comedies and satyric dramas. But he is best known as the author of the Σίλλοι, three books of sarcastic hexameter verses, written against the Greek philosophers.

The fragments that remain (about 140 lines or parts of lines, printed in F. W. A. Mullach, *Frag. phil. graec.* i. 84–98) show that Timon possessed some of the qualities of a great satirist, together with a command of the hexameter; but he had no loftier aim than to awaken laughter. Philosophers are "excessively cunning murderers of many wise saws" (*v.* 96); the only two whom he spares are Xenophanes, "the modest censor of Homer's lies" (*v.* 29), and Pyrrho, against whom "no other mortal dare contend" (*v.* 126). Besides the Σίλλοι we have some lines preserved from the Ἰνδαλμοί, a poem in elegiac verse, which appears to have inculcated the tenets of scepticism, and one or two fragments which cannot be with certainty assigned to either poem. There is a reference to Timon in Eus. *Praep. Ev.* xiv. (Eng. trans. by E. H. Gifford, 1903, p. 761). Fragments of his poems have been collected by Wölke, *De graecorum syllis* (Warsaw, 1820), Paul, *Dissertatio de syllis* (Berlin, 1821), and Wachsmuth, *Sillographorum graec. reliquiae* (Leipzig, 1885).

TIMOR, an island of the Malay Archipelago, the easternmost and largest of the Lesser Sunda Islands, stretching S.W. and N.E.

for 300 m. between 8° 40′ and 10° 40′ S., and between 123° 30′ and 127° E. It has a mean breadth of 60 m., and an area of about 12,500 sq. m. Politically its north-eastern half is Portuguese, as are two small enclaves in the south-western half, the remainder being Dutch. Timor lies in deep water a little to the west of the hundred fathom line, which marks in this direction the proper limit of the shallow Arafura Sea, extending between it and northern Australia. It differs considerably from the other members of the Sundanese group both in the direction of its main axis and in the prevalence of old rocks and slighter volcanic character. It comes, however, within the great volcanic zone which stretches from the north of Sumatra, through Java and the other Sundanese islands, round to Amboyna, Tidore, Ternate, Halmahera and the Philippines. There appear to be volcanic centres in both the east and the west of the island, and the surface is everywhere extremely rugged, with ridges from 4000 to 8000 ft. high, forming a confused orographic system, which is by no means fully understood. Mount Kabalaki in the north rises above 10,000 ft.; the culminating point appears to be Mt Alas (over 12,000 ft.) near the east coast. Owing to the prevalent dry easterly winds from the arid plains of north Australia, Timor, like Ombay, Flores and other neighbouring islands, has a much drier climate, and a poorer vegetation, than islands further west, and has few perennial streams and no considerable rivers. Hence, apart from almost untouched mineral wealth, such as iron, copper and gold, the island is poor in natural resources. Coal and petroleum have been found. At Kupang, on the south coast, the number of rainy days per month in the six months May to October dwindles from 4 to 0, while the monthly rainfall gradually sinks from a little less than 2 in. to nil; the northern districts are better watered. Though the mineral products are varied, the supply of ores has hitherto proved scanty; besides which their exploitation is rendered difficult by the lack of labourers, water and wood. The uplands yield fairly under cultivation, while the woodlands, which nowhere form true forests, contain much excellent sandalwood. This and a noted breed of hardy ponies form the chief articles of export. Owing to the deep water between Timor and the Arafura Sea, the fauna of Timor presents scarcely any Australian types beyond a marsupial cuscus. The few mammals, such as deer, civet, pigs, shrews and monkeys, as well as the birds and insects, resemble ordinary Malayan forms.

Timor consists of a core of ancient rocks (Archean?) upon which rest Permian and later deposits of sedimentary origin. Volcanic rocks are also present but they are not so extensively developed as in the islands of the Javan arc. The Permian beds consist chiefly of limestone and contain numerous fossils similar to those of the middle and upper divisions of the Productus limestone of northern India and the Artinsk stage of the Urals. The best-known locality is the bed of the Ayer Mati near Kupang. These rocks were originally referred to the Carboniferous system, and similar limestones have been recorded in many parts of the island. Triassic beds with *Halobia* and *Monotis* are well-developed in Rotti and appear also to occur in Timor. The fauna is similar to that of the Mediterranean Trias. Fragments of Jurassic rock have been found amongst the volcanic material on the island of Rotti, but they have not yet been discovered *in situ*. The Tertiary deposits form a fringe around the older rocks, and in some places this fringe extends far up into the interior of the island.

The bulk of the population is certainly Papuan, but intermingled with Malayan, Polynesian and other elements; hence it presents an extraordinary diversity of physical types, as is clearly shown by the portraits figured in H. O. Forbes's *Naturalist's Wanderings in the Eastern Archipelago*. The natives, still mainly independent of their nominal Dutch and Portuguese rulers, are divided into many hostile tribes, speaking as many as forty distinct Papuan and Malayan languages or dialects. Some are addicted to head-hunting, at least during war, and to other barbarous practices. In their *uma-luli*, or sacred (tabooed) enclosures, rites are performed resembling those of the Polynesian islanders.

Portuguese Timor includes the neighbouring isle of Pulo Kambing, and has an area of about 7450 sq. m. Estimates of the population vary from 300,000 to over half a million. Dilli, on the north coast, the administrative headquarters and chief settlement, is a poor little place of some 3000 inhabitants, containing hardly any Europeans apart from the officials. Macao was administratively united to Portuguese Timor till 1896, and still pays a contribution to the revenue. The estimated revenue for 1901–1902 was £25,196 (£7200 from Macao), and in 1905–1906 it was £26,968; the estimated expenditure was £36,532 in the earlier and £43,320 in the later period. Few ships visit the colony, except Dutch vessels trading in the archipelago, which call regularly at Dilli. Exports (principally coffee and wax) are valued at about £55,000 annually, and imports at about the same amount.

Dutch Timor has an area of a little over 5000 sq. m. Kupang, the chief town of the residency, contains some 8000 inhabitants, of whom 145 are Europeans living in well-built houses, 594 Chinese, and 43 Arabs. In agriculture, European plants have not been successful, and of native products the supply is only sufficient for the home consumption. The export of sandalwood, ponies, cattle, pinang nuts, &c., amounts in a year to only about £8500. Dutch Timor gives its name to a residency comprising, besides its own territory, the small adjacent islands, Rotti, Peman, &c., the Savu islands, Sumba or Sandalwood island, the Solor and Allor group of islands, and the eastern half of Flores, all lying between 8° 5′ and 11° 5′ S. and 119° 3′ and 125° 15′ E., the total area being 17,698 sq. m. It is divided into four administrative districts—Timor, Rotti and Savu, Larantuka (eastern Flores) and Sumba. Pop. of the residency (1905), 308,500.

It is possible that the Portuguese visited Timor before the Spaniards did so in 1522. They were, at any rate, established on the island when the Dutch expelled them from Kupang in 1613. During the 18th century the two powers came frequently into conflict; and in 1859 their boundaries were settled by treaty. This treaty was replaced by one signed at Lisbon in June 1893. The old treaty had proved irksome in many ways, especially as it left portions of the territory belonging to protected chieftains of each power as enclaves within the boundaries of the other. This led to frequent disputes, and a mixed boundary commission was therefore appointed under the new treaty and determined more satisfactory boundaries. The new treaty, moreover, stipulates that all future disputes shall be referred to arbitration. Equally important is the declaration, signed at the same time, that either power would favour the subjects of the other in granting concessions, &c., to the exclusion of all others. Thus Portugal and Holland secured the exclusive possession of Timor to themselves.

See P. A. van der Lith, *Nederlands-Indië* (Leiden, 1893–1894). H. O. Forbes, *A Naturalist's Wanderings in the Eastern Archipelago* (London, 1885); and other general works (cf. Malay Archipelago). Some of the problems connected with the physical features of Timor are discussed in H. Zondervan's "Timor en de Timoreezen," *Tijdschr. Aardr. Gen.* (1888), vol. v. (with bibliography); K. Martin and A. Wichmann, *Sammlungen des geologischen Reichsmuseums* (Leiden, 1881–1884); A. Wichmann, "Bericht über eine Reise nach dem indischen Archipel," *Tijdschr. Aardr. Gen.* (1890–1892), with sketches of Timor, map, &c.; A. Rothpletz, *Die Perm-, Trias-, und Jura-Formation auf Timor und Rotti im indischen Archipel, Palaeontographica* (1892) pp. 57–106. There is a summary of Rothpletz's results in *American Naturalist* (1891), xxv. 959–962. For the remarkable flying survey of the south coast by the commandant of the Siboga expedition, exploring the deep seas and fauna of the archipelago, see *Bulletin* (No. 35) of the *Maatschappij ter bevordering van het natuurkun onderzoëk der N.I. Koloniën*; R. Dores, "Apontamentos para um diccionario chorographico de Timor," *Bol. Soc. Geogr. Lisbon* (1901), vol. xix.

TIMOR LAUT ("Seaweed Timor"; Dutch, *Timor Laoet*), Tenimber or Tenimbar, a group of islands in the Malay Archipelago, S.W. of the Aru Islands, between 6° 20′ and 8° 30′ S., and 130° 40′ and 132° 5′ E. By the Dutch, in whose residency of Amboyna they are included, they are politically divided into two districts; Larat, including the inhabited islands of Larat, Vordate, Molu, and Maro, together with many uninhabited islands; and Sera, including the Sera Islands, Selaru, and the southern part of Yamdena, all inhabited. Only Yamdena and Selaru are by the natives called Timor Laut; all the others they call Tenimbar. The group is in the main coralline. Vordate, Molu and south-eastern Yamdena have a maximum height of 820 ft.; the rest are low and flat, except Laibobar, apparently a volcanic islet on the west, which has an extinct crater 2000 ft. high. Yamdena, the largest island, has an area of about 1100 sq. m.; the rest together about 1000. Ritabel in Larat is the only safe roadstead during the east and west monsoons. The fauna includes buffaloes, a marsupial cuscus, some bats, the beautiful scarlet lory, rare varieties of the ground-thrush, honey-eater and oriole. The population is estimated at about 19,000. The aborigines are Papuans, but much mixed with Malayan and perhaps Polynesian elements. They are a fine race, often over 6 ft. tall, noted for their artistic sense. In other respects they are pagans in a low state of culture, mostly divided into hostile communities and addicted to piracy. The only means of subsistence is primitive agriculture on a poor soil, turtle and trepang fishery and cattle-rearing. The yearly export (trepang, turtle and kamuning wood) is valued at only £850 to £1650.

R. van Hoëvell, "Tanimbar en Timor Laoet-Eilanden," in *Tijdschrift Batavian Genootschap* (1889), vol. xxxiii.; J. D. Garson, "On Cranial Characters of the Natives of Timor-Laut," *Journ. Anthrop. Instit.* xiii. 386.

TIMOTHEUS, Athenian statesman and general, son of Conon, the restorer of the walls of Athens. From 378–356 B.C. he frequently held command in the war between Athens (in alliance with Thebes), and Sparta. The object of Athens was to revive the old confederacy (see DELIAN LEAGUE, § B), and to regain command of the sea, and in 375 Timotheus was sent with a fleet to sail round Peloponnesus by way of demonstration against Sparta. He gained over Cephallenia, secured the friendship of the Acarnanians and Molossians, and took Corcyra, but used his victory with moderation. Want of funds and jealousy of the Thebans led to a short peace. In 373 Timotheus was appointed to the command of a fleet for the relief of Corcyra, then beleaguered by the Spartans. But his ships were not fully manned, and to recruit their strength he cruised in the Aegean. The delay excited the indignation of the Athenians, who brought him to trial; but, thanks to the exertions of his friends—Jason, tyrant of Pherae, and Alcetas, king of the Molossians, both of whom went to Athens to plead his cause—he was acquitted. He had previously been superseded in his command by Iphicrates. Being reduced to great povery—for he had pledged his private property in order to put the fleet in an efficient state—he left Athens and took service with the king of Persia. We next hear of him about 366, when, having returned to Athens, he was sent to support Ariobarzanes, satrap of Phrygia. But, finding that the satrap was in open revolt against Persia, Timotheus, in conformity with his instructions, abstained from helping him and turned his arms against Samos, then occupied by a Persian garrison, and took it after a ten months' siege (366–65). He then took Sestus, Crithote, Torone, Potidaea, Methone, Pydna and many other cities; but two attempts upon Amphipolis failed. An action was brought against him by Apollodorus, the son of the banker Pasion, for the return of money lent by the father. The speech for the plaintiff is still extant, and is attributed (though not unanimously) to Demosthenes. It is interesting as showing the manner in which Timotheus had exhausted the large fortune inherited from his father and the straits to which he was reduced by his sacrifices in the public cause. In 358 or 357, the Athenians, in response to a spirited appeal of Timotheus, crossed over to Euboea and expelled the Thebans in three days. In the course of the Social War Timotheus was despatched with Iphicrates, Menestheus, son of Iphicrates, and Chares to put down the revolt. The hostile fleets sighted each other in the Hellespont; but a gale was blowing, and Iphicrates and Timotheus decided not to engage. Chares, disregarding their opposition, lost many ships, and in his despatches he complained so bitterly of his colleagues that the Athenians put them on their trial. The accusers were Chares and Aristophon, both men of notoriously bad character. Iphicrates, who had fewer enemies than Timotheus, was acquitted; but Timotheus, who had always been disliked for his arrogance, was condemned to pay a very heavy fine. Being unable to pay, he withdrew to Chalcis, where he died soon afterwards. The Athenians showed their repentance by remitting the greater part of the fine to his son Conon. His remains were buried in the Ceramicus and statues erected to his memory in the agora and the acropolis.

See Life by Cornelius Nepos; Diodorus Siculus xv., xvi.; Isocrates, *De permutatione*; Pseudo-Demosthenes, *Adversus Timotheum*; C. Rehdantz, *Vitae Iphicratis, Chabriae, Timothei* (1845); and especially Holm, *Hist. of Greece* (Eng. trans., vol. iii.).

TIMOTHEUS, an Athenian sculptor of the 4th century B.C., and one of the artists employed on the Mausoleum of Halicarnassus. An inscription at Epidaurus shows that he was employed to furnish models for the pedimental sculptures of the temple of Aesculapius on that site, and to execute in marble the external decorations (acroteria) for one of the gables. Considerable remains of the acroteria and the pedimental figures have been discovered (see GREEK ART, fig. 44; and EPIDAURUS).

TIMOTHEUS, of Miletus (*c.* 446–357 B.C.), Greek musician and dithyrambic poet. He added one or more strings to the lyre, whereby he incurred the displeasure of the Spartans and Athenians (E. Curtius, *Hist. of Greece*, bk. v. ch. 2). He composed musical works of a mythological and historical character.

Fragments in T. Bergk, *Poetae lyrici graeci*. A papyrus-fragment of his *Persians* (the oldest papyrus in existence), discovered at Abusir has been edited by U. von Wilamowitz-Möllendorff (1903), with discussion of the nome, metre, the number of strings of the lyre, date of the poet and fragment. See V. Strazzulla, *I. Persiani di Eschilo ed il nomo di Timoteo* (1904); S. Sudhaus in *Rhein. Mus.*, lviii. (1903), p. 481; and T. Reinach and M. Croiset in *Revue des études grecques*, xvi. (1903), pp. 62, 323.

TIMOTHY or TIMOTHEUS, in the Bible (Acts xvi. 1, xvii. 14, &c.), a Lycaonian, the son of a Gentile father and a Jewish mother, Eunice (2 Tim. i. 5), was born at Lystra, and was already a member of the Christian Church there at the time of Paul's second visit. He took the place formerly occupied by John Mark in Paul's company, and in deference to Jewish feeling was circumcised. He accompanied the apostle on many of his journeys, and was employed by him on important missions (1 Thess. iii. 2; 1 Cor. iv. 17, xvi. 10). Paul speaks of him as his "son," and this (see Phil. ii. 22) refers to loyal service rather than to spiritual parentage. He was especially interested in the Macedonian churches, which he helped to found. His name is associated with that of Paul in the opening salutations of both epistles to the Thessalonians, the second epistle to the Corinthians, and those to the Philippians and Colossians. He was, therefore, with Paul at Rome. At a later date he is mentioned in Heb. xiii. 23 as having undergone imprisonment, but as having been released. On the basis of the epistles of Paul to Timothy, Timothy is traditionally represented as bishop of Ephesus, and tradition also tells that he suffered under Domitian. His martyrdom is celebrated on the 24th of January in the Latin Church, on the 22nd in the Greek.

The apocryphal *Acta Timothei* (Greek and Latin) have been edited by Usener (Bonn, 1877); cf. Lipsius, *Apokr. Apostelgeschichten* (1884), ii. 2.

TIMOTHY, FIRST EPISTLE TO. This book of the New Testament is really a pastoral letter upon church order, addressed by the apostle Paul to the Asiatic Christian communities in and round Ephesus (i. 3).[1] The object of the writing is stated in iii. 15: πῶς δεῖ ἐν οἴκῳ θεοῦ ἀναστρέφεσθαι. It is thrown into the literary form[2] of a letter from Paul to his lieutenant Timothy, but, as the closing salutation indicates (vi. 21, "grace be with you," ὑμῖν), the writer really has the Church in his mind all through. The Pauline standard of doctrine is set up (i. 3–20) as the norm of thought and practice. This trust and tradition is to be maintained throughout the churches. It involves, the writer proceeds to argue, the proper conduct of public worship (ii. 1 seq., 8 seq.), and the proper qualification for *episcopi* (iii. 2 seq.) and *diaconi* (iii. 8 seq.). The finale of this section (iii. 15–16) leads, by way of contrast, to a sharp prophetic warning against contemporary errorists (iv. 1 seq.), with advice upon the proper management of various classes of people within the Church (v. 1 seq.). Special attention is given to the ecclesiastical "widows" (3 seq.) and to presbyters (17 seq.). After a word on slaves and masters (vi. 1–2), the epistle recurs to the errorists (vi. 3 seq.), passing into a warning against wealth (6 seq.) and an impressive closing charge (11 seq.). The writing closes with the ἡ χάρις μεθ' ὑμῶν of verse 21. The context and contents of vi. 17–21a suggest that it is a later interpolation, such as writings on church discipline were

[1] The same motive occurs in the preface to Irenaeus's treatise, *Adv. haer.*

[2] The opposite view, which insists upon the definite character of the pastorals, is ably stated by A. Ruegg in *Aus Schrift und Geschichte* (1898), pp. 59–108. Otto and Kölling attempt to refer πορευόμενος (i. 3) to Timothy, not to Paul, and in this way to refer the situation to Acts xix. 22; but this is exegetically untenable.

particularly exposed to (Harnack). Their inorganic character naturally permitted later generations to bring them up to date, and accretions of this kind may be suspected in 1 Tim. iii. 1–13, v. 17–20 (22a), vi. 17–21, as well as in Tit. i. 7–9. Other verses, like iii. 11 and v. 23, have all the appearance of misplaced glosses, perhaps from the margin. When vi. 20–21 is thus taken as a later addition, it becomes possible[1] to see in the reference to ἀντιθέσεις τῆς ψευδωνύμου γνώσεως an allusion to Marcion's well-known volume.

Attempts have been made by some critics, particularly Hesse (*Die Entstehung der neutest. Hirtenbriefe*, 1889: i. 1–10, 18–20, iv. 1–16, vi. 3–16, 20 seq.) and Knoke (*Prakt. theol. Kommentar*, 1887, 1889: *a*=i. 3 seq., 18–20, ii. 1–10, iv. 12, v. 1–3, 4c–6, 11–15, 19–23, 24 seq., written to Timothy from Corinth; *b*=i. 12–17, iii. 14–16, iv. 1–11, 13–16, ii. 12–15, v. 7 seq., vi. 17–19, i. 5–11, vi. 2c–16, 20 seq., written from Caesarea), to disentangle one or more original notes of Paul from the subsequent additions, but the comparative evenness of the style does not favour such analyses.[2] They have more relevance and point in 2 Tim. than in 1 Tim. P. Ewald, in his *Probabilia betr. d. Text des 1 Tim.* (1901), falls back upon the hypothesis of the papyri leaves or sheets having been displaced, and conjectures that i. 12–17 originally lay between i. 2 and i. 3, while iii. 14–iv. 10 has been misplaced from after vi. 2. But his keen criticism of Hesse and Knoke is more successful than his positive explanation of the textual phenomena, and a more thorough-going process of literary criticism is necessary in order to solve the problems of the epistle. Its irregular character, abrupt connexions and loose transitions[3] are due to the nature of the subject rather than to any material disarrangement of its paragraphs.

The phenomena of style have to be viewed in a broad light. Allowance must be made for the difference of vocabulary produced by change of subject. The evidence of ἅπαξ εὑρημένα is always to be received with caution and strict scrutiny; no hard and fast rule must be set up to judge the language of a man like Paul. Yet such considerations do not operate against the literary judgment that the pastorals did not come from Paul's pen. The words and phrases which are common to the pastorals and the rest of the Pauline epistles are neither so characteristic nor so numerous as those peculiar to the former, and the data of style may be summed up in the verdict that they point to a writer who, naturally reproducing Paul's standpoint as far as possible, and acquainted with his epistles, yet betrays the characteristics of his later *milieu* in expressions as well as in ideas.[4] Thus, of 174 words which occur in the pastorals alone (of all the New Testament writings), 97 are foreign to the Septuagint and 116 to the rest of the Pauline letters. This proportion of ἅπαξ εὑρημένα is extremely large, when the size of the pastorals is taken into account, and its significance is heightened by the further fact that several of Paul's characteristic expressions tend to be replaced by others (*e.g.* περιπατεῖν and στοιχεῖν by ἀναστρέφειν, &c., κύριος by δεσπότης, παρουσία by ἐπιφάνεια), while a large number of Pauline words are entirely absent (*e.g.* ἄδικος, ἐλευθερία, καυχᾶσθαι, μείζων, μικρός, μωρία, παράδοσις, πείθειν, περισσεύειν, σῶμα, &c.). Nor is this by any means all. "Difference in vocabulary may be partially explained (though only partially in this case) by difference of subject-matter and of date; but the use of particles is one of the most unfailing of literary tests. The change in the use of particles and the comparative rarity of the definite article form, together with the startling divergence in vocabulary, the chief ground of our perplexity" (*Church Quarterly Review*, 1903, pp. 428 seq.). Pauline particles like ἄρα, διό, διότι, ἔπειτα, ἔτι, ἴδε and ἰδού disappear; the Pauline σύν is replaced by μετά, while prepositions like ἄντι, ἄχρι, ἔμπροσθεν and παρά (accus.) drop out entirely. A number of Latinisms, unexampled in the rest of Paul's epistles, occur within the pastorals; whole families of new words, especially composite words (often compounded with ἀ-privative, θεο-, οἰκο-, καλο-,[5] σωφρο-, φιλο-), emerge with others, *e.g.* εὐσέβεια, πιστὸς ὁ λόγος, &c.; and the very greeting is un-Pauline (1 Tim. i. 2; 2 Tim. i. 2). The peculiarities of syntax corroborate the impression made by such features of the vocabulary. There is less flow than in the rest of the Pauline letters; "the syntax is stiffer and more regular . . . the clauses are marshalled together, and there is a tendency to parallelism" (Lightfoot, *Biblical Essays*, p. 402). An increase of sententious imperative clauses is also to be noted. Doubtless, some of these features might be set down to Paul's amanuensis.[6] But not all of them, more especially when the characteristic conceptions and ideas of the pastorals are taken into account. Nor can it be argued that the characteristics of the pastorals are those of private letters; they are not private, nor even semi-private as they stand; besides, the only private note from Paul's hand (Philemon) bears no traces of the special diction exhibited in the epistles to Timothy and Titus.

Furthermore, throughout the pastorals, and especially in 1 Tim., there are traces of a wider acquaintance with Greek literature[7] than can be detected in the letters of Paul. Affinities to Plutarch (cf. J. Albani in *Zeitschrift für wiss. Theologie*, 1902, 40–58) and to 4 as well as to 2 Maccabees are not improbable.

1 Tim. also gives clearest expression to the author's ecclesiastical and doctrinal views. The objective sense of πίστις has begun to overpower the subjective. Christianity is becoming more and more a "form of sound words," a crystallized creed, whose teaching is the vital point. The deep conceptions of Paul, viz. the fatherly love of God, the faith-mysticism of the Christian's relation to Christ, and the inward witness of the Spirit, fall into the background, while unusual prominence is assigned to the more tangible and practical tests of Christianity.

Of all the pastorals, 1 Tim. is furthest from Paul.[8] The author writes more out of his own mind, evidently with little or no special material to fall back upon. The epistle is not a compilation from the two others (as Schleiermacher thought), but it seems to denote a slightly later stage.[9] Many critics therefore (*e.g.* De Wette, Mangold, Reuss, Bruckner, Pfleiderer, von Soden, McGiffert, S. Davidson, Bourquin, Clemen and Jülicher) conclude that the pastorals were written in this order (2 Tim., Titus, 1 Tim.). When the epistles were arranged for the canon, it was natural to put 2 Tim. later than the other two, since its setting seemed to imply the close of Paul's career. Its literary priority is confirmed by several resemblances between it and Philippians, the last of Paul's epistles (*e.g.* ἀνάλυσις iv. 6 = ἀναλύειν Phil. i. 23, and σπένδεσθαι iv. 6 = Phil. ii. 17).

LITERATURE.—The following special monographs on 1 Tim. are noteworthy: Melanchthon's *Enarratio epist. I. Pauli ad Timotheum et duorum capitum secunda* (1561), Heshusius, *Commentarius in priorem epist. Pauli ad Timotheum* (1582), Gerhard, *Annotationes ad I. Pauli ad Tim. epistolam* (1643) and M. G. E. Leo, *Pauli epistola I. ad Tim. cum perpetuo commentario* (Leipzig, 1837; full and exact). More modern essays are published by Kölling, *Der I. Brief Paulus an Tim. aufs neue untersucht und ausgelegt* (1882 seq.) and, from a conservative standpoint, by Liddon (1897). Two other essays appeared in the early part of last century, by Beckhaus, *Specimen observationum de verbis ἅπαξ λεγόμ. et rarioribus dicendi formulis in prima ad Tim. epistola Paulina obviis* (1810) and A. Curtius, *De tempore quo prior epist. Tim. exarata sit* (1828). In the difficult passage (v. 18), both quotations seem to be ranked as from ἡ γραφή, in which case the

---

[1] When the literary integrity of the epistle is maintained this allusion naturally drops to the ground, since the use of the epistle by Polycarp rules the earlier conjectures of Baur and others (who made the pastorals anti-Marcionite) out of court; besides, passages like i. 7 (Titus i. 10, 14) would not apply to the Marcionites. Dr Hort (*Judaistic Christianity*, pp. 113 seq.) prefers to group both the false γνῶσις (cf. Rom. ii. 20) and the ἀντιθέσεις as Jewish casuistical decisions, the γενεαλογίαι of i. 4 and Tit. iii. 9 being the legendary pedigrees of Jewish heroes, such as are prominent in Philo and the Book of Jubilees. Cf. Wohlenberg, pp. 30–36, and on the other side Klöpper in *Zeits. für wiss. Theologie* (1902), pp. 339 seq.

[2] Hesse's, in particular, is shipwrecked on the assumption that the Ignatian epistles must be dated under Marcus Aurelius.

[3] Thus ii. 11–15 seems almost like a gloss (Hesse, Knoke), iv. 1–8 parts easily from its context, and the οὖν of ii. 1 indicates a very loose relationship to the preceding paragraphs.

[4] So the philologist T. Nägeli (*Der Wortschatz des Apostels Paulus*, 1905, pp. 85 seq.), whose opinion is all the more significant on this point that he refuses to admit any linguistic features adverse to the Pauline authorship of the other epistles.

[5] Καλός, which Paul never uses as an attribute, is mainly employed in this way by the author. On σωτήρ as applied to God, cf. Wagner in *Zeits. f. neut. Wiss.* (1905), pp. 221 seq.

[6] The so-called "Lucan" features (cf. Holtzmann, pp. 92 seq., and Von Soden in *Theologische Abhandlungen*, 1892, pp. 133–135) have suggested that Luke may have been the amanuensis (cf. 2 Tim. iv. 11), or even the author of the pastorals.

[7] *E.g.* Tit. i. 11 (cf. Plut. *Moral.* 967, 13), ii. 3 (cf. Thuc. ii. 61; Xen. *Mem.* i. 5, 5, 6, 8); 2 Tim. ii. 17 (cf. Plut. *Moral.* 65 D ὁ δὲ καρκίνος πολυδιάχυτον ἐν τῷ σώματι πάθος); 1 Tim. i. 6 (cf. Plut. *Moral.* 414 Εἰ ἀστοχοῦσι τοῦ μετρίου καὶ πρέποντος), i. 10 (cf. Plut. *De educ. lib.* 5 A τοῦ ὑγιαίνοντος καὶ τεταγμένου βίου καταφρονεῖν, for ὑγιής = "normal"; cf. Plato's *Protagoras*, 346 C), i. 19 (cf. Galen, x. 307, ἐν οἷς ἐναύγησαν οἱ πρόσθεν ἰατροί = "came to grief"), vi. 5 (cf. Plut. *Cato major*, 25, *Moral.* 92 B with Plato's *Protagoras*, 313).

[8] Even linguistically Titus and 1 Tim. are closer to one another than either to 2 Tim. The latter has no allusion to the καλὸν ἔργον, the ἑτεροδιδασκαλεῖν, the διαβεβαιοῦσθαι, &c., of the others, and contains one or two specific phrases of its own. 1 Tim., like Ephesians, is a writing whose lack of greetings and general tone point to the functions of an encyclical or Catholic epistle.

[9] For details, cf. *Ency. Bib.* 5093–5094. Of the five "faithful sayings," three occur in 1 Tim.; these condensed aphorisms tally with liturgical fragments such as the famous quotation in 1 Tim. iii. 16, a formula of confession written in small short cola (cf. Klöpper in *Zeitschrift für wiss. Theologie*, 1902, pp. 336 seq.).

second (cf. Luke x. 7) goes back to either Luke's gospel or its source at this particular point. The hypothesis that a saying of Jesus is loosely added here to an Old Testament citation is very forced, and the inference is that by the time the author wrote, Luke's gospel was reckoned as γραφή. This would be explicable if Luke could be assumed to have been the author, in whole or part, of the pastorals. (J. Mt.)

TIMOTHY, SECOND EPISTLE TO. In this book of the New Testament, after a brief thanksgiving for the faith of Timothy (i. 1–5), Paul is represented as warning him against false shame (6 seq.), adducing his own example and that of Onesiphorus. The need and the reward of endurance are then urged (ii. 1–13), and Timothy is bidden to adhere in his work to the Pauline gospel against the seductions of controversial and immoral heretics (ii. 14 seq.).[1] The practices of the latter are pungently depicted[2] (iii. 1–9); Paul reiterates his opening counsels (10 seq.) and then closes with a solemn charge to personal faithfulness. A note of personal matters concludes the epistle (iv. 6–22).

The last verse, with its two-fold greeting (ὁ κύριος μετὰ τοῦ πνεύματός σου, ἡ χάρις μεθ' ὑμῶν), shows unconsciously but plainly that, while the epistle professes to be a private letter to Timothy, it is in reality addressed to a wider circle, like 1 Tim. and Titus. But its composite origin is also clear.[3] Thus iv. 6–22a, which is certainly authentic, is not homogeneous in itself, the situation of verses 6–8 hardly agreeing with that of 9 seq., while verse 11 ("Luke alone is with me") cannot have been written at the same time as verse 21. Various schemes of analysis have been proposed to account for this and other passages of the same nature in the epistle, *e.g.* i. 15–18, iii. 10 seq. But the general result of such reconstructions is tentative. All that criticism has succeeded in establishing is the fact that the author had some *reliquiae Paulinae* at his disposal, notes written either before or during his last imprisonment in Rome,[4] and that these have been worked up into the present letter by one who rightly believed that his master would stoutly oppose the current errors of the age.

2 Timothy, like 1 Timothy, reveals with fair precision the period and aim of the writer of the pastorals. Evidently (cf. Acts xx. 29–30) the Pauline Christianity of Ephesus was imperilled seriously during the last quarter of the 1st century. Its very growth invited attempts to weave ascetic, theosophic, semi-Jewish fancies round the faith, not unlike the attempts often made in modern India to assimilate Christian and local philosophies of religion. Against such the writer argues in Paul's name, as Luke had already done. From the composition of a speech in Paul's name (for, though the farewell in Acts goes back to first-hand tradition, it represents the author's standpoint as well as Paul's), it was but a step to compose letters in his name, especially on the basis of some of his extant notes. A genuine concern for local Christianity is the writer's justification for his work, and any idea of fraudulent aims must be dismissed at once.[5] "To a writer of this period, it would seem as legitimate an artifice to compose a letter as to compose a speech in the name of a great man whose sentiments it was desired to reproduce and record; the question which seems so important to us, whether the words and even the sentiments are the great man's own or only his historian's, seems then hardly to have occurred either to writer or readers" (W. H. Simcox, *Writers of the New Testament*, p. 38). The address at Miletus is Paul's last word to the Christian elders of Ephesus, warning them against heresies (Acts xx. 29 seq.) and solemnly bidding them exercise their disciplinary duties. The Second Epistle to Timothy carries on this line of advice. Here Paul, being dead, yet speaks through Timothy to the local Christians who are exposed to such mischievous tendencies in their environment.

Where the writer has hardly succeeded in representing Paul is in his relations to Timothy. One may admit that, strictly speaking, the latter at the age of about thirty-five or forty could still be called νέος, and that Paul might conceivably have termed him still his τέκνον. But the counsels addressed to him seem rather out of place when one recollects the position which he occupied. To a writer who desired a situation for such advice on church life and doctrine from the lips of Paul to his lieutenant, it was natural to think of a temporary absence.[6] But many of the directions are much too serious and fundamental to have been given in this form; one can hardly imagine that Paul considered Timothy (or Titus) still in need of elementary advice and warning upon such matters, and especially on personal purity. When they are regarded as typical figures of the later *episcopi* of the Church, the point of this emphasis upon elementary principles and duties is at once clear; they outline graphically the qualifications for the church offices in question.

The pressing need of the Church, as the writer conceives it, is to maintain the true Pauline tradition (2 Tim. i. 13, &c.) against certain moral and speculative ideas. This maintenance takes the twofold practical form of (*a*) adherence to formulated statements of the "sound teaching" and (*b*) insistence on a succession of church officials (2 Tim. ii. 1–2) who are not merely to preside but to teach. The last point is significant in view of Didachê xv. 1. The standpoint of the author is practically that of Clemens Romanus (xlii. seq.), who asserts that the apostles preached "everywhere in country and town, appointing their first-fruits, when they had proved them by the Spirit, to be bishops and deacons." The interests of discipline and doctrine were thus to be conserved.[7] Paul's lieutenants possess the central deposit of the apostolic faith, and have the duty as well as the right of exercising the authority with which that position invests them.

The occasional coincidences between the pastorals and Barnabas or Clemens Romanus do not prove anything more than a common *milieu* of thought, but the epistles were plainly familiar to Polycarp, who alludes to 1 Tim. ii. 1, vi. 7, 10, and 2 Tim. ii. 11, 25, iv. 10 (for this and the other passages from Polycarp, see *The New Testament in the Apostolic Fathers*, 1905, pp. 95 seq.). This indubitable use of the pastorals in Polycarp[8] throws the *terminus ad quem* of their composition back into the first decade of the 2nd century, and additional confirmation of this would be forthcoming were the evidence for their use in Ignatius more

[1] Bahnsen gives an ingenious analysis of this section in the epistle. In ii. 8–13, ii. 6 is developed; in ii. 14–26, ii. 4; and in iii. 1–4 (8), ii. 5. But this is as artificial as Otto's attempt to classify the contents of the epistle under the three notes of the πνεῦμα in i. 7.

[2] On iii. 6 see the fragment from Philo quoted in Euseb. *Praep. Evang.* viii. 11.

[3] "If the epistle was an integral as we have it, its genuineness could scarcely be maintained" (Laughlin, p. 26).

[4] Bacon (*Story of St Paul*, p. 198) and Clemen both assign part of the epistle to the Caesarean imprisonment, the former disentangling iv. 9, 11–18, 20–21a, 22b, the latter iv. 9–18. Hitzig had already found a Caesarean letter in i. 15, iv. 13–16, 20–22a. One great point in favour of such theories is that they give a natural sense to iv. 16, Paul's first defence being that before the Jews or before Felix.

[5] Cf. the present writer's *Historical New Testament* (2nd ed., 1901, pp. 619 seq.), where the relevant literature is cited. An adequate monograph on ancient pseudonymous literature remains to be written; meantime, further reference may be made to the older essays of Mosheim (*Dissertatio de caussis suppositorum librorum inter Christianos saeculi primi et secundi*, 1733); Bentley's *Dissertation on Phalaris*, pp. 80 seq.; K. R. Köstlin's article in *Theol. Jahrbücher* (1851), pp. 149–221, on "Der pseud. Litteratur der ältesten Kirche"; and A. Güdemann, in *Classical Studies in Honour of H. Drissler*, pp. 52–74 (New York, 1894).

[6] The drawback was that, if Paul was soon to see his colleagues again (Titus i. 5; 1 Tim. i. 3), such detailed advice was hardly necessary; but this imperfection was inevitable.

[7] The post-Pauline atmosphere of the ecclesiastical regulations is felt most plainly in the references to such sub-apostolic features as the organized register of "widows." The ἐπίσκοπος, the διάκονος and the χήρα are also forbidden to contract a second marriage. Such, at any rate, seems the fairest interpretation of 1 Tim. iii. 2 (ἐπίσκοπος) in the light of early Christian tradition, for although the phrase "husband of one wife" might conceivably be intended as a prohibition of polygamy or vice (=faithful husband, or sober, married man), the antipathy to second marriages (cf. Jacoby, *Neutest. Ethik*, pp. 378 seq.) is quite in accord with sub-apostolic practice. It is almost as un-Pauline as the assumption that every ἐπίσκοπος must be married. Cf. on this whole subject Hilgenfeld (*Zeitschrift für wiss. Theologie*, 1886, pp. 456 seq.) and Schmiedel (*Encycl. Biblica*, 3113 seq.); the opposite position is stated excellently by Hort (*Christian Ecclesia*, 1898, 189 seq.) and Dr T. M. Lindsay (*Hibbert Journal*, i. 166 seq., and in *The Church and the Ministry in the early Centuries*, 1903, pp. 139 seq.).

[8] The pastorals soon passed into great favour in the early Church. Their method and aim were entirely congenial to the rising Catholic Church, and one is not surprised to find from writers in the East (Theophilus of Antioch, Justin Martyr) and West (Irenaeus, Tertullian and the author of 2 Clement) that they were widely read and valued. Absent from Marcion's canon, they were included in the Muratorian, where they appear as private letters ("pro affectu et dilectione"). See, on the external evidence in general, Zahn's *Geschichte der neutest. Kanons*, i. 634 seq.

secure. The occasional similarities of thought and expression between them and the Lucan writings suggest that the period of their origin lies within a quarter of a century after Paul's death, and, when one or two later accretions are admitted, the internal evidence, either upon the organization of the church[1] or upon the errors controverted, tallies with this hypothesis.

Literature.—Special monographs on this epistle by Leo (1850) and Bahnsen (*Die sogenannten Pastoralbriefe, I., der 2 Tim.*, 1876) are to be noted. For a textual discussion of ii. 19, cf. Resch's *Paulinismus*, pp. 258–259. The allusion to the βιβλία, μάλιστα τὰς μεμβράνας (iv. 13) has produced a wealth of discussion; the latter were probably *pugillares membranei*, sheets for private memoranda. The books may have included the Logia or Evangeli Scriptures from which 1 Tim. v. 18 is quoted (so Resch), but this is a mere conjecture. Cf., on the whole question, Birt's *Das antike Buchwesen*, pp. 50 seq., 65, 88 seq., and Nestle's *Einführung in das griechische N. T.* (1899), pp. 39 seq. (J. Mt.)

TIMŪR (*Timur i Leng*, the lame Timūr), commonly known as Tamerlane, the renowned Oriental conqueror, was born in 1336 at Kesh, better known as Shahr-i-Sabz, "the green city," situated some 50 m. south of Samarkand in Transoxiana. His father Teragai was head of the tribe of Berlas. Great-grandson of Karachar Nevian (minister of Jagatai, son of Jenghiz Khan, and commander-in-chief of his forces), and distinguished among his fellow-clansmen as the first convert to Islamism, Teragai might have assumed the high military rank which fell to him by right of inheritance; but like his father Burkul he preferred a life of retirement and study. Under the paternal eye the education of young Timūr was such that at the age of twenty he had not only become an adept in manly outdoor exercises but had earned the reputation of being an attentive reader of the Koran. At this period, if we may credit the *Memoirs* (*Malfūẓāt*), he exhibited proofs of a tender and sympathetic nature.

About 1358, however, he came before the world as a leader of armies. His career for the next ten or eleven years may be thus briefly summarized from the *Memoirs*. Allying himself both in cause and by family connexion with Kurgan, the dethroner and destroyer of Kazan, chief of the western Jagatai, he was deputed to invade Khorasan at the head of a thousand horse. This was the second warlike expedition in which he was the chief actor, and the accomplishment of its objects led to further operations, among them the subjection of Khwarizm and Urganj. After the murder of Kurgan the contentions which arose among the many claimants to sovereign power were arrested by the invasion of Toghluk Timūr of Ḳashgar, a descendant of Jenghiz. Timūr was despatched on a mission to the invader's camp, the result of which was his own appointment to the government of Māwarā-'lnahr (Transoxiana). By the death of his father he was also left hereditary head of the Berlas. The exigencies of his quasi-sovereign position compelled him to have recourse to his formidable patron, whose reappearance on the banks of the Sihon created a consternation not easily allayed. Māwarā'lnahr was taken from Timūr and entrusted to a son of Toghluk; but he was defeated in battle by the bold warrior he had replaced at the head of a numerically far inferior force. Toghluk's death facilitated the work of reconquest, and a few years of perseverance and energy sufficed for its accomplishment, as well as for the addition of a vast extent of territory. During this period Timūr and his brother-in-law, Hosain—at first fellow-fugitives and wanderers in joint adventures full of interest and romance—became rivals and antagonists. At the close of 1369 Hosain was assassinated and Timūr, having been formally proclaimed sovereign at Balkh, mounted the throne at Samarkand, the capital of his dominions.

The next thirty years or so were spent in various wars and expeditions. Timūr not only consolidated his rule at home by the subjection of intestine foes, but sought extension of territory by encroachments upon the lands of foreign potentates. His conquests to the west and north-west led him among the Mongols of the Caspian and to the banks of the Ural and the Volga; those to the south and south-west comprehended almost every province in Persia, including Bagdad, Kerbela and Kurdistan. One of the most formidable of his opponents was Toktamish, who after having been a refugee at the court of Timūr became ruler both of the eastern Kipchak and the Golden Horde, and quarrelled with Timūr over the possession of Khwarizm. It was not until 1395 that the power of Toktamish was finally broken (see Mongols; Golden Horde).

In 1398, when Timūr was more than sixty years of age, Farishta tells us that, "informed of the commotions and civil wars of India," he "began his expedition into that country," and on the 12th of September "arrived on the banks of the Indus." His passage of the river and upward march along the left bank, the reinforcement he provided for his grandson Pir Mahommed (who was invested in Multan), the capture of towns or villages accompanied, it might be, with destruction of the houses and the massacre of the inhabitants, the battle before Delhi and the easy victory, the triumphal entry into the doomed city, with its outcome of horrors—all these circumstances belong to the annals of India. In April 1399, some three months after quitting the capital of Mahmūd Toghluk, Timūr was back in his own capital beyond the Oxus. It need scarcely be added that an immense quantity of spoil was conveyed away. According to Clavijo, ninety captured elephants were employed merely to carry stones from certain quarries to enable the conqueror to erect a mosque at Samarkand. The war with the Turks and Egyptians which succeeded the return from India was rendered notable by the capture of Aleppo and Damascus, and especially by the defeat and imprisonment of Sultan Bayezid I. (see Turkey: *History*, and Egypt: *History*, Mahommedan period). This was Timūr's last campaign. Another was projected against China, but the old warrior was attacked by fever and ague when encamped on the farther side of the Sihon (Syr-Daria) and died at Atrār (Otrar) on the 17th of February 1405. Markham, in his introduction to the narrative of Clavijo's embassy, states that his body "was embalmed with musk and rose water, wrapped in linen, laid in an ebony coffin and sent to Samarkand, where it was buried." Timūr had carried his victorious arms on one side from the Irtish and the Volga to the Persian Gulf and on the other from the Hellespont to the Ganges.

Timūr's generally recognized biographers are—'Alī Yazdī, commonly called Sharifu 'd-Dīn, author of the Persian *Zafarnāma*, translated by Petis de la Croix in 1722, and from French into English by J. Darby in the following year; and Ahmad ibn Mohammed ibn Abdallah, al Dimashki, al 'Ajmi, commonly called Ibn 'Arabshāh, author of the Arabic *'Ajaibu 'l Makhlnkāt*, translated by the Dutch Orientalist Golius in 1636. In the work of the former, as Sir William Jones remarks, "the Tartarian conqueror is represented as a liberal, benevolent and illustrious prince"; in that of the latter he is "deformed and impious, of a low birth and detestable principles." But the favourable account was written under the personal supervision of Timūr's grandson, Ibrāhīm, while the other was the production of his direst enemy. Few indeed, if any, original annals of this class are written otherwise than to order, under patronage, or to serve a purpose to which truth is secondary. Among less reputed biographies or materials for biography may be mentioned a second *Zafarnāma*, by Maulānā Nizāmu 'd-Dīn Shanab Ghāzāni (Nizām Shāmī), stated to be "the earliest known history of Timūr, and the only one written in his lifetime"; and vol. i. of the *Matla'u's-Sa'dain*—a choice Persian MS. work of 1495—introduced to Orientalists in Europe by Hammer, Jahrbücher, Dorn and (notably) Quatremère. There are also the *Memoirs* (*Malfūẓāt*) and *Institutes* (*Tuzukāt*), of which an important section is styled *Designs and Enterprises* (*Tadbīrāt wa Kangāshahā*). Upon the genuineness of these doubt has been thrown. The circumstance of their alleged discovery and presentation to Shah Jahān in 1637 was of itself open to suspicion. Alhazen, quoted by Purchas in his quaint notice of Timūr and referred to by Sir John Malcolm, can hardly be accepted as a serious authority. His assumed memoir was printed for English readers in 1597 by William Ponsonby under the title of a *Historie of the Great Emperor Tamerlan, drawn from the ancient monuments by Messire Jean du Bec, Abbot of Mortimer*; and another version of the same book is to be found in the *Histoire du Grand Tamerlan*, by De Sainctyon, published at Amsterdam in 1678. But, although the existence of this Alhazen of Jean de Bec has been believed by many, the more trustworthy critics consider the history and historian to be equally fictitious.

Reference may be made to two more sources of information.

[1] The pastorals in this aspect are closer to Clemens Romanus than to Ignatius.

(1) Supposed likenesses of Timūr are to be found in books and in the splendid collection of Oriental manuscripts and drawings in the British Museum. One contained in the *Shah Jahān Nāma* —a gorgeous specimen of illuminated Persian manuscript and exquisite calligraphy—represents a most ordinary, middle-aged Oriental, with narrow black whisker fringing the cheek and meeting the tip of the chin in a scanty, pointed beard; a thin moustache sweeps in a semicircle from above the upper lip; the eyebrow over the almond-shaped eye is marked but not bushy. But it were vain to seek for an expression of genius in the countenance. Another portrait is included in a set of sketches by native artists, some of which, taken probably from life, show great care and cleverness. Timūr is here displayed as a stoutish, long-bodied man, below the middle-height, in age and feature not unlike the first portrait, but with thicker and more straggling hair, and distincter, though not more agreeable character in the facial expression, yet not a sign of power, genius, or any elements of grandeur or celebrity. The uncomfortable figure in the Bodleian Library does not give much help. Sir John Malcolm has been at some pains to invest his portrait of Timūr with individuality. But an analysis of his results leaves the reader in more perplexity than satisfaction at the kind of information imparted, and he reverts insensibly to the sources from which his instructor has himself been instructed. (2) As regards plays, in Marlowe's *Tamburlaine* Timūr is described as tall of stature, straightly fashioned, large of limb, having joints strongly knit, long and sinewy arms, a breadth of shoulders to "bear old Atlas's burden," pale of complexion, and with "amber hair wrapp'd in curls." The outline of this description might be from Sharifu 'd-Dīn, while the colours are the poet's own. A Latin memoir of Tamerlane by Perondinus, printed in 1600, entitled *Magni Tamerlanis scytharum imperatoris vita*, describes Timūr as tall and bearded, broad-chested and broad-shouldered, well-built but lame, of a fierce countenance and with receding eyes, which express cruelty and strike terror into the lookers-on. But Jean du Bec's account of Timūr's appearance is quite different. Now *Tamburlaine* was written in 1586. The first English translation of Jean du Bec is dated in 1595, the *Life* by Perondinus in 1600, and Petis de la Croix did not introduce Sharifu 'd-Dīn or 'Alī Yazdī to European readers till 1722. The dramatist must have heard of Timūr in other quarters, equally reliable it may be with those available in the present stage of Oriental research. At the beginning of the 18th century Timūr was represented in Rowe's *Tamerlane* as a model of valour and virtue. The plot, however, has little to do with history, and is improbable and void of interest. By Matthew Gregory Lewis again "Timour" is depicted as the conventional tyrant of a gorgeous melodrama, slaying, burning, slaughtering and committing every possible atrocity until checked by a violent death and a poetical climax.

Apart from modern European *savants* and historians, and the more strictly Oriental chroniclers who have written in Persian, Turkish or Arabic, the following authorities may be cited—Laonicus Chalcondylas, Joannes Leunclavius, Joachimus Camerarius, Petrus Perondinus, Lazaro Soranzo, Simon Mairlus, Matthew Michiovius. A score or so of other names are given by Samuel Purchas. See also Sir Clements Markham's *Clavijo*, in the Hakluyt Society's publications; White's edition of Davy's translation of the *Institutes* (1783); Stewart's translation of the *Malfūẓāt*; Malcolm's *History of Persia*; and *Trans. Roy. Soc.* (1885); Horn, "Gesch. Irans in islam. Zeit," in Geiger and Kuhn, *Grundr. der iranisch. Philol.* (1904); works quoted, *s.v.* MONGOLS. (F. J. G.)

TIN (Lat. *stannum*, whence the chemical symbol "Sn"; atomic weight=117·6, O=16), a metallic chemical element. Being a component of bronze, it was used as a metal thousands of years prior to the dawn of history; but it does not follow that prehistoric bronzes were made from metallic tin. When the unalloyed metal was first introduced cannot be ascertained with certainty. The "tin" of the Bible (κασσίτερος in the Septuagint) corresponds to the Hebrew *bedhil*, which is really a copper alloy known as early as 1600 B.C. in Egypt. All we know is that about the 1st century the Greek word κασσίτερος designated tin, and that tin was imported from Cornwall into Italy after, if not before, the invasion of Britain by Julius Caesar. From Pliny's writings it appears that the Romans in his time did not realize the distinction between tin and lead: the former was called *plumbum album* or *candidum* to distinguish it from *plumbum nigrum* (lead proper). The word *stannum* definitely assumed its present meaning in the 4th century (H. Kopp). By the early Greek alchemists the metal was named Hermes, but at about the beginning of the 6th century, it was termed Zeusor Jupiter, and the symbol ♃ assigned to it; it was also referred to as *diabolus metallorum*, on account of the brittle alloys which it formed.

Occurrence.—Grains of metallic tin occur intermingled with the gold ores of Siberia, Guiana and Bolivia, and in a few other localities. Of minerals containing this element mention may be made of cassiterite (*q.v.*) or tinstone, SnO_2, tin pyrites, $Cu_4SnS_4+(Fe,Zn)_2SnS_4$; the metal also occurs in some epidotes, and in company with columbium, tantalum and other metals. Of these "tinstone" is of the greatest commercial importance. It occurs in its matrix, either in or closely associated with fissure veins or disseminated through rock masses. It is also found in the form of rolled lumps and grains, "stream tin," in alluvial gravels; the latter are secondary deposits, the products of the disintegration of the first-named primary deposits. Throughout the world, primary deposits of tinstone are in or closely connected with granite or acid eruptive rocks of the same type, its mineral associates being tourmaline, fluorspar, topaz, wolfram and arsenical pyrites, and the invariable gangue being quartz: the only exception to this mode of occurrence is to be found in Bolivia, where the tin ore occurs intimately associated with silver ores, bismuth ores and various sulphides, whilst the gangue includes barytes and certain carbonates. Over five-sixths of the world's total production is derived from secondary alluvial deposits, but all the tin obtained in Cornwall (the alluvial deposits having been worked out) and Bolivia is from vein mining, while a small portion of that yielded by Australasia comes from veins and from granitic rocks carrying disseminated tinstone.

Production.—During the 18th century the world's supply of tin was mainly drawn from the deposits of England, Saxony and Bohemia; in 1801 England produced about 2500 tons, while the supplies of Saxony and Bohemia had been greatly diminished. The English supply increased, with some oscillations, to between six and seven thousand tons annually in the period 1840–1860, when it suddenly rose to about 10,000 tons, and this figure was fairly well sustained until about 1890, when a period of depression set in; the yield for 1900 was 4336 tons, and for 1905 about 4200 tons. In the opening decades of the 19th century supplies began to be drawn from Banka; in 1820 this island contributed 1200 tons; the production was increased to 12,000 tons in 1900, when a diminution set in, 9960 tons being the output during 1905. Billiton became of note in 1853 with a production of 40 tons, which increased to 6000 in 1900 and has since declined to about 3000 tons in 1905. The Straits Settlements ranked as an important producer in 1870 with 2337 tons; it now supplies the greater part of the world's supply, contributing 46,795 tons in 1900, and over 60,000 tons in 1905. Australian deposits were worked in 1872, and in the following year the production was 3000 tons; the maximum outputs were in 1881–1883, averaging 10,000 tons annually; but the supply declined to 2420 tons in 1898 and has since increased to about 5028 tons in 1905. Bolivia produced 501 tons in 1883, 10,245 in 1900 and 12,500 in 1905.

The world's supply in 1900 was 72,911 long tons; this increased in 1904 to 97,790 tons, but in 1905, principally owing to a shortage in the supplies from the Straits and Banka, the yield fell to 94,089 tons.

Metallurgy.—The operations in the metallurgy of tin may be enumerated as: (1) mining and dressing, (2) smelting, (3) refining. The first stage has for its purpose the production of a fairly pure tinstone; the second the conversion of the oxide into metallic tin; and the third preparing a tin pure enough for commercial purposes.

Mining and Dressing.—The alluvial deposits are almost invariably worked opencast, those of the Malay Peninsula and Archipelago chiefly by Chinese labour: in a few instances hydraulic mining has been resorted to, and in other cases true underground mining is carried on; but the latter is both exceptional and difficult. The alluvial extracted, which in the Malay Peninsula and Archipelago carries from 5 to 60 lb of tinstone (or "black tin," as it is termed by Cornish miners) to the cubic yard of gravel, is washed in various simple sluicing appliances, by which the lighter clay, sand and stones are removed and tinstone is left behind comparatively pure, containing usually 65 to 75% of metallic tin (chemically pure tinstone contains 78·7%).

Lode tin, as tinstone derived from primary deposits is often termed, is mined in the ordinary method, the very hard gangue in which it occurs necessitating a liberal use of explosives. The veinstuff is broken small either by hand or in rock-breakers, and stamped to fine powder in stamp mills, which are practically large mechanically-worked pestles and mortars, the stamp proper weighing from 500 to 1000 lb. The mineral, crushed small enough to pass a sieve with perforations $\frac{1}{40}$ in. in diameter, leaves the stamps in suspension in water, and passes through a series of troughs in which the heavier mineral is collected; this then passes through a series of washing operations, which leaves a mixture consisting chiefly of tinstone and arsenical pyrites, which is calcined and washed again, until finally black tin containing about 60 to 65% of metal is left. The calcination is preferably effected in mechanical roasters, it being especially necessary to agitate the ore continually, otherwise it cakes. The crude tinstuff raised in Cornwall carries on an average a little over 2% of black tin. The Bolivian tin ore is treated by first extracting the silver by amalgamation, &c., and afterwards concentrating the residues; there are, however, considerable difficulties in the way of treating the poorer of these very complex ores, and several chemical processes for extracting their metallic contents have been worked out. Of the impurities of the ore the wolframite (tungstate of iron and manganese) is the most troublesome, because on account of its high specific gravity it cannot be washed away as gangue. To remove it, Oxland fuses the ore with a certain proportion of carbonate of soda, which suffices to convert the tungsten into soluble alkaline tungstate, without producing noteworthy quantities of soluble stannate from the oxide of tin; the tungstate is easily removed by treatment with water.

2. *Smelting.*—The dressed ore is smelted with carbon by one of two main methods, viz. either in the shaft furnace or the reverberatory; the former is the better suited to stream tin, the latter to lode tin, but either ore can be smelted in either way, although reverberatory practice yields a purer metal. Shaft furnace smelting is confined to those parts of the world where charcoal can still be obtained in large quantities at moderate prices. The furnace consists of a shaft, circular (or more rarely rectangular) in plan, into which alternate layers of fuel and ore are charged, an air blast being generally injected near to the bottom of the furnace through one or more tuyeres. This was the primitive process all over the world; in the East, South America and similar regions it still holds its own. In Europe, Australasia and one large works at Singapore it has been practically replaced by the reverberatory furnace process, first introduced into Cornwall about the year 1700. In this process the purified ore is mixed with about one-fifth of its weight of a non-caking coal or anthracite smalls, the mixture being moistened to prevent it from being blown off by the draught, and is then fused on the sole of a reverberatory furnace for five or six hours. The slag and metal produced are then run off and the latter is cast into bars; these are in general contaminated with iron, arsenic, copper and other impurities.

3. *Refining.*—All tin, except a small quantity produced by the shaft furnace process from exceptionally pure stream tin ore, requires refining by liquation and "boiling" before it is ready for the market. In the English process the bars are heated cautiously on an inclined hearth, when relatively pure tin runs off, while a skeleton of impure metal remains. The metal run off is further purified by *poling*, *i.e.* by stirring it with the branch of a tree—the apple tree being preferred traditionally. This operation is no doubt intended to remove the oxygen diffused throughout the metal as oxide, part of it perhaps chemically by reduction of the oxide to metal, the rest by conveying the finely diffused oxide to the surface and causing it to unite there with the oxide scum. After this the metal is allowed to rest for a time in the pot at a temperature above its freezing point and is then ladled out into ingot forms, care being taken at each stage to ladle off the top stratum. The original top stratum is the purest, and each succeeding lower stratum has a greater proportion of impurities; the lowest consists largely of a solid or semi-solid alloy of tin and iron.

To test the purity of the metal the tin-smelter heats the bars to a certain temperature just below the fusing point, and then strikes them with a hammer or lets them fall on a stone floor from a given height. If the tin is pure it splits into a mass of granular strings. Tin which has been thus manipulated and proved incidentally to be very pure is sold as grain tin. A lower quality goes by the name of block tin. Of the several commercial varieties Banka tin is the purest; it is indeed almost chemically pure. Next comes English grain tin.

For the preparation of chemically pure tin two methods are employed. (1) Commercially pure tin is treated with nitric acid, which converts the tin proper into the insoluble metastannic acid, while the copper, iron, &c., become nitrates; the metastannic acid is washed first with dilute nitric acid, then with water, and is lastly dried and reduced by fusion with black flux or potassium cyanide. (2) A solution of pure stannous chloride in very dilute hydrochloric acid is reduced with an electric current. According to Stolba, beautiful crystals of pure tin can be obtained as follows: A platinum basin, coated over with wax or paraffin outside, except a small circle at the very lowest point, is placed on a plate of amalgamated zinc, lying on the bottom of a beaker, and is filled with a solution of pure stannous chloride. The beaker also is cautiously filled with acidulated water up to a point beyond the edge of the platinum basin. The whole is then left to itself, when crystals of tin gradually separate out on the bottom of the basin.

Properties.—An ingot of tin is pure white (except for a slight tinge of blue); the colour depends, however, upon the temperature at which it is poured—if too low, the surface is dull, if too high, iridescent. It exhibits considerable lustre and is not subject to tarnishing on exposure to normal air. The metal is pretty soft and easily flattened out under the hammer, but almost devoid of tenacity. That it is elastic, with narrow limits, is proved by its clear ring when struck with a hard body in circumstances permitting of free vibration. The specific gravity of cast tin is 7·29, of rolled tin 7·299, and of electrically deposited tin 7·143 to 7·178. A tin ingot is distinctly crystalline; hence the characteristic crackling noise, or "cry" of tin, which a bar of tin gives out when being bent. This structure can be rendered visible by superficial etching with dilute acid; and as the minuter crystals dissolve more quickly than the larger ones, the surface assumes a frosted appearance (*moirée métallique*). The metal is dimorphous: by cooling molten tin at ordinary air temperature tetragonal crystals are obtained, while by cooling at a temperature just below the melting point rhombic forms are produced. When exposed for a sufficient time to very low temperatures (to −39° C. for 14 hours), tin becomes so brittle that it falls into a grey powder, termed the *grey modification*, under a pestle; it indeed sometimes crumbles into powder spontaneously. At ordinary temperatures tin proves fairly ductile under the hammer, and its ductility seems to increase as the temperature rises up to about 100° C. At some temperature near its fusing point it becomes brittle, and still more brittle from −14° C. downwards. Iron renders the metal hard and brittle; arsenic, antimony and bismuth (up to 0·5%) reduce its tenacity; copper and lead (1 to 2%) make it harder and stronger but impair its malleability; and stannous oxide reduces its tenacity. Tin fuses at about 230° C.; at a red heat it begins to volatilize slowly; at 1600° to 1800° C. it boils. The hot vapour produced combines with the oxygen of the air into white oxide, SnO_2. Its coefficient of linear expansion between 0° and 100° is 0·002717; its specific heat 0·0562; its thermal and electrical conductivities are 145 to 152 and 114·5 to 140·1 respectively compared to silver as 1000.

Industrial Applications.—Commercially pure tin is used for making such apparatus as evaporating basins, infusion pots, stills, &c. It is also employed for making two varieties of tin-foil—one for the silvering of mirrors (see MIRROR), the other for wrapping up chocolate, toilet soap, tobacco, &c. The mirror foil must contain some copper to prevent it from being too readily amalgamated by the mercury. For making tin-foil the metal is rolled into thin sheets, pieces of which are beaten out with a wooden mallet. As pure tin does not tarnish in the air and is proof against acid liquids, such as vinegar, lime juice, &c., it is utilized for culinary and domestic vessels. But it is expensive, and tin vessels have to be made very heavy to give them sufficient stability of form; hence it is generally employed merely as a protecting coating for utensils made essentially of copper or iron. The tinning of a copper basin is an easy operation. The basin, made scrupulously clean, is heated to beyond the fusing point of tin. Molten tin is then poured in, a little powdered sal-ammoniac added, and the tin spread over the inside with a bunch of tow. The sal-ammoniac removes the last unavoidable film of oxide, leaving a purely metallic surface, to which the tin adheres firmly. For tinning small objects of copper or brass (*i.e.* pins, hooks, &c.) a wet-way process is followed. One part of cream of tartar, two of alum and two of common salt are dissolved in boiling water, and the solution is boiled with granulated metallic tin (or, better, mixed with a little stannous chloride) to produce a tin solution; and into this the articles are put at a boiling heat. In the absence of metallic tin there is no visible change; but, as soon as the metal is introduced, an electrolytic action sets in and the articles get coated over with a firmly adhering film of tin. Tinning wrought iron is effected by immersion. The most important form of the operation is making tinned from ordinary sheet iron (making what is called "sheet tin"). This process was mentioned by Agricola; it was practised in Bohemia in 1620, and in England a century later. The iron plates, having been carefully cleaned with sand and hydrochloric or sulphuric acid, and lastly with water, are plunged into heated tallow to drive away the water without oxidation of the metal. They are next steeped in a bath, first of molten ferruginous, then of pure tin. They are then taken out and kept suspended in hot tallow to enable the surplus tin to run off. The tin of the second bath dissolves iron gradually and becomes fit for the first bath. To tin cast-iron articles they must be decarburetted superficially by ignition within a bath of ferric oxide (powdered haematite or similar material), then cleaned with acid, and tinned by immersion, as explained above. (See TIN-PLATE.) By far the greater part of the tin produced metallurgically is used for making tin alloys (see PEWTER, BRONZE).

Compounds of Tin.

Tin forms two well-marked series of salts, in one of which it is divalent, these salts being derived from stannous oxide, SnO, in the other it is tetravalent, this series being derived from stannic oxide, SnO_2.

Stannous Oxide, SnO, is obtained in the hydrated form $Sn_2O(OH)_2$ from a solution of stannous chloride by addition of sodium carbonate; it forms a white precipitate, which can be washed with air-free water and dried at 80° C. without much change by oxidation; if it be heated in carbon dioxide the black SnO remains. Precipitated stannous hydrate dissolves readily in caustic potash; if the solution is evaporated quickly it suffers decomposition, with formation of metal and stannate, $2SnO+2KOH=K_2SnO_2+Sn+H_2O$. If it is evaporated slowly, anhydrous stannous oxide crystallizes out in forms which are combinations of the cube and dodecahedron. Dry stannous oxide, if touched with a glowing body, catches fire and burns to stannic oxide, SnO_2. Stannous oxalate when heated by itself in a tube leaves stannous oxide.

Stannic Oxide, SnO_2.—This, if the term is taken to include the hydrates, exists in a variety of forms. (1) *Tinstone* (see above and also CASSITERITE) is proof against all acids. Its disintegration for analytical purposes can be effected by fusion with caustic alkali in silver basins, with the formation of soluble stannate, or by fusion with sulphur and sodium carbonate, with the formation of a soluble thiostannate. (2) A similar oxide (*flores jovis*) is produced by burning tin in air at high temperatures or exposing any of the hydrates to a strong red heat. Such *tin-ash*, as it is called, is used for the polishing of optical glasses. *Flores stanni* is a finely divided mixture of the metal and oxide obtained by fusing the metal in the presence of air for some time. (3) *Metastannic acid* (generally written $H_{10}Sn_5O_{15}$, to account for the complicated composition of metastannates, *e.g.* the sodium salt $H_8Na_2Sn_5O_{15}$) is the white compound produced from the metal by means of nitric acid. It is insoluble in water and in nitric acid and apparently so in hydrochloric acid; but if heated with this last for some time it passes into a compound, which, after the acid mother liquor has been decanted off, dissolves in water. The solution when subjected to distillation behaves very much like a physical solution of the oxide in hydrochloric acid, while a solution of orthostannic acid in hydrochloric acid behaves like a solution of $SnCl_4$ in water, *i.e.* gives off no hydrochloric acid, and no precipitate of hydrated SnO_2. Metastannic acid is distinguished from orthostannic acid by its insolubility in nitric and sulphuric acids. The salts are obtained by the action of alkalies on the acid. (4) Orthostannic acid is obtained as a white precipitate on the addition of sodium carbonate or the exact quantity of precipitated calcium carbonate to a solution of the chloride. This acid, H_2SnO_3, is readily soluble in acids forming stannic salts, and in caustic potash and soda, with the formation of orthostannates. Of these sodium stannate, Na_2SnO_3, is produced industrially by heating tin with Chile saltpetre and caustic soda, or by fusing very finely powdered tinstone with caustic soda in iron vessels. A solution of the pure salt yields fine prisms of the composition $Na_2SnO_3+10H_2O$, which effloresce in the air. The salt is used as a mordant in dyeing and calico-printing. Alkaline and other stannates when treated with aqueous hydrofluoric acid are converted into fluostannates (*e.g.* K_2SnO_3 into K_2SnF_6), which are closely analogous to, and isomorphous with, fluosilicates.

A *colloidal* or *soluble stannic acid* is obtained by dialysing a mixture of tin tetrachloride and alkali, or of sodium stannate and hydrochloric acid. On heating it is converted into colloidal metastannic acid.

A hydrated *tin trioxide*, SnO_3, was obtained by Spring by adding barium dioxide to a solution of stannous chloride and hydrochloric acid; the solution is dialysed, and the colloidal solution is evaporated to form a white mass of $2SnO_3 \cdot H_2O$.

Stannous Chloride, $SnCl_2$, can only be obtained pure by heating pure tin in a current of pure dry hydrochloric acid gas. It is a white solid, fusing at 250° C. to an oily liquid which boils at 606°, and volatilizing at a red heat in nitrogen, a vacuum or hydrochloric acid, without decomposition. The vapour density below 700° C. corresponds to Sn_2Cl_4, above 800° C. to nearly $SnCl_2$. The chloride readily combines with water to form a crystallizable hydrate $SnCl_2 \cdot 2H_2O$, known as "tin salt" or "tin crystals." This salt is also formed by dissolving tin in strong hydrochloric acid and allowing it to crystallize, and is industrially prepared by passing sufficiently hydrated hydrochloric acid gas over granulated tin contained in stoneware bottles and evaporating the concentrated solution produced in tin basins over granulated tin. The basin itself is not attacked. The crystals are very soluble in cold water, and if the salt is really pure a small proportion of water forms a clear solution; but on adding much water most of the salt is decomposed, with the formation of a precipitate of oxychloride, $2Sn(OH)Cl \cdot H_2O$. According to Michel and Kraft, one litre of cold saturated solution of tin crystals weighs 1827 grammes and contains 1333 grammes of $SnCl_2$. The same oxychloride is produced when the moist crystals, or their solution, are exposed to the air. Hence all tin crystals as kept in the laboratory give with water a turbid solution, which contains stannic in addition to stannous chloride. The complete conversion of stannous into stannic chloride may be effected by a great many reagents—for instance, by chlorine (bromine, iodine) readily; by mercuric chloride in the heat, with precipitation of calomel or metallic mercury; by ferric chloride in the heat, with formation of ferrous chloride; by arsenious chloride in strongly hydrochloric solutions, with precipitation of chocolate-brown metallic arsenic. All these reactions are available as tests for "stannosum" or the respective agents. In opposition to stannous chloride, even sulphurous acid (solution) behaves as an oxidizing agent. If the two reagents are mixed a precipitate of yellow stannic sulphide is produced. A strip of metallic zinc when placed in a solution of stannous chloride precipitates the tin in crystals and takes its place in the solution. Stannous chloride is largely used in the laboratory as a reducing agent, in dyeing as a mordant.

Stannic Chloride, $SnCl_4$, named by Andreas Libavius in 1605 *Spiritus argenti vivi sublimati* from its preparation by distilling tin or its amalgam with corrosive sublimate, and afterwards termed *Spiritus fumans Libavii*, is obtained by passing dry chlorine over granulated tin contained in a retort; the tetrachloride distils over as a heavy liquid, from which the excess of chlorine is easily removed by shaking with a small quantity of tin filings and re-distilling. It is a colourless fuming liquid of specific gravity 2·269 at 0°; it freezes at −33° C., and boils at 113·9°. The chloride unites energetically with water to form crystalline hydrates (*e.g.* $SnCl_4 \cdot 3H_2O$), easily soluble in water. With one-third its weight of water it forms the so-called "butter of tin." It combines readily with alkaline and other chlorides to form double salts, *e.g.* M_2SnCl_6, analogous to the chloroplatinates; the salt $(NH_4)_2SnCl_6$ is known industrially as "pink salt" on account of its use as a mordant to produce a pink colour. The *oxymuriate of tin* used by dyers is $SnCl_4 \cdot 5H_2O$. The plain chloride solution is similarly used. It is usually prepared by dissolving the metal in aqua regia.

Stannous Fluoride, SnF_2, is obtained as small, white monoclinic tables by evaporating a solution of stannous oxide in hydrofluoric acid in a vacuum. *Stannic Fluoride*, SnF_4, is obtained in solution by dissolving hydrated stannic oxide in hydrofluoric acid; it forms a characteristic series of salts, the stannofluorides, M_2SnF_6, isomorphous with the silico-, titano-, germano- and zirconofluorides. *Stannous bromide*, $SnBr_2$, is a light yellow substance formed from tin and hydrobromic acid. *Stannic bromide*, $SnBr_4$, is a white crystalline mass, melting at 33° and boiling at 201°, obtained by the combination of tin and bromine, preferably in carbon bisulphide solution. *Stannous iodide*, SnI_2, forms yellow red needles, and is obtained from potassium iodide and stannous chloride. *Stannic iodide*, SnI_4, forms red octahedra and is prepared similarly to stannic bromide. Both iodides combine with ammonia.

Stannous sulphide, SnS, is obtained as a lead-grey mass by heating tin with sulphur, and as a brown precipitate by adding sulphuretted hydrogen to a stannous solution; this is soluble in ammonium polysulphide, and dries to a black powder. *Stannic sulphide*, SnS_2, is obtained by heating a mixture of tin (or, better, tin amalgam), sulphur and sal-ammoniac in proper proportions in the beautiful form of *aurum musivum* (mosaic gold)—a solid consisting of golden yellow, metallic lustrous scales, and used chiefly as a yellow "bronze" for plaster-of-Paris statuettes, &c. The yellow precipitate of stannic sulphide obtained by adding sulphuretted hydrogen to a stannic solution readily dissolves in solutions of the alkaline sulphides to form *thiostannates* of the formula M_2SnS_3; the free acid, H_2SnS_3, may be obtained as an almost black powder by drying the yellow precipitate formed when hydrochloric acid is added to a solution of a thiostannate.

Analysis.—Tin compounds when heated on charcoal with sodium carbonate or potassium cyanide in the reducing blowpipe flame yield the metal and a scanty ring of white SnO_2. Stannous salt solutions yield a brown precipitate of SnS with sulphuretted hydrogen, which is insoluble in cold dilute acids and in real sulphide of ammonium, $(NH_4)_2S$; but the yellow, or the colourless reagent on addition of sulphur, dissolves the precipitate as SnS_2 salt. The solution on acidification yields a yellow precipitate of this sulphide. Stannic salt solutions give a yellow precipitate of SnS_2 with sulphuretted hydrogen, which is insoluble in cold dilute acids but readily soluble in sulphide of ammonium, and is re-precipitated therefrom as SnS_2 on acidification. Only stannous salts (not stannic) give a precipitate of calomel in mercuric chloride solution. A mixture of stannous and stannic chloride, when added to a sufficient quantity of solution of chloride of gold, gives an intensely purple precipitate of gold purple (purple of Cassius). The test is very delicate, although the colour is not in all cases a pure purple. Tin is generally quantitatively estimated as the dioxide. The solutions are oxidized, precipitated with ammonia, the precipitate dissolved in hydrochloric acid, and re-thrown down by boiling with sodium sulphate. The precipitate is filtered, washed, dried and ignited.

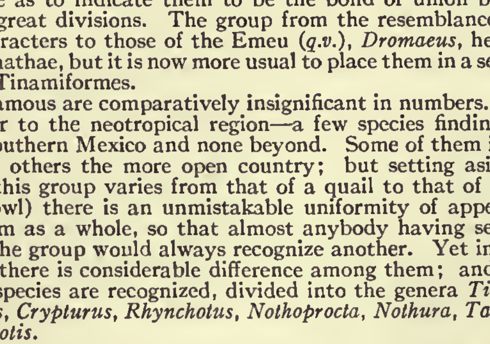
BIBLIOGRAPHY.—For the history of tin and statistics of its production, &c., see Bernard Neumann, *Die Metalle* (1904); A. Rossing, *Geschichte der Metalle* (1901). For its chemistry see Roscoe and Schorlemmer, *Treatise on Inorganic Chemistry*, vol. ii.; H. Moissan, *Traité de chimie minérale*; O. Dammer, *Handbuch der anorganischen Chemie*. For its production and metallurgy see Sydney Fawns, *Tin Deposits of the World*; A. G. Charleton, *Tin Mining*; Henry Louis, *The Production of Tin*, and C. Schnabel, *Handbook of Metallurgy* (English trans. by Louis, 1907). General statistical information, and improvements in the metallurgy, &c., are recorded annually in *The Mineral Industry*.

TINAMOU, the name given in Guiana to a certain bird, as stated in 1741 by P. Barrère (*France équinoxiale*, p. 138), from whom it was taken and used in a more general sense by Buffon (*Hist. nat. oiseaux*, iv. 502). In 1783 J. Latham (*Synopsis*, ii. 724) adopted it as English, and in 1790 (*Index*, ii. 633) Latinized it *Tinamus*, as the name of a new and distinct genus. The "Tinamou" of Barrère has been identified with the "Macucagua" described and figured by Marcgrav in 1648, and is the *Tinamus major* of modern authors.[1]

Buffon and his successors saw that the Tinamous, though passing among the European colonists of South America as "Partridges," could not be associated with those birds, and Latham's step, above mentioned, was generally approved. The genus he had founded was usually placed among the Gallinae, and by many writers was held to be allied to the bustards, which, it must be remembered, were then thought to be "struthious." Indeed the likeness of the Tinamou's bill to that of the Rhea (*q.v.*) was remarked in 1811 by Illiger. On the other hand L'Herminier in 1827 saw features in the Tinamou's sternum that in his judgment linked the bird to the Rallidae. In 1830 J. Wagler (*Nat. Syst. Amphibien*, &c., p. 127) placed the Tinamous in the same order as the ostrich and its allies; and, though he did this on very insufficient grounds, his assignment has turned out to be not far from the mark, as in 1862 the great affinity of these groups was shown by W. K. Parker's researches, which were afterwards printed in the Zoological *Transactions* (v. pp. 205–232, 236–238, pls. xxxix.–xli.), and was further substantiated by him in the *Philosophical Transactions* (1866, pp. 174–178, pl. xv.). Shortly after this T. H. Huxley in his often-quoted paper in the Zoological *Proceedings* (1867, pp. 425, 426) was enabled to place the whole matter in a clear light, urging that the Tinamous formed a very distinct group of birds which, though not to be removed from the Carinatae, presented so much resemblance to the Ratitae as to indicate them to be the bond of union between those two great divisions. The group from the resemblance of its palatal characters to those of the Emeu (*q.v.*), *Dromaeus*, he called Dromaeognathae, but it is now more usual to place them in a separate order, the Tinamiformes.

The Tinamous are comparatively insignificant in numbers. They are peculiar to the neotropical region—a few species finding their way into southern Mexico and none beyond. Some of them inhabit forests and others the more open country; but setting aside size (which in this group varies from that of a quail to that of a large common fowl) there is an unmistakable uniformity of appearance among them as a whole, so that almost anybody having seen one species of the group would always recognize another. Yet in minor characters there is considerable difference among them; and about sixty-four species are recognized, divided into the genera *Tinamus*, *Nothocercus*, *Crypturus*, *Rhynchotus*, *Nothoprocta*, *Nothura*, *Taoniscus* and *Tinamotis*.

To the ordinary spectator Tinamous have much the look of partridges, but the more attentive observer will notice that their



Rufous Tinamou (*Rhynchotus rufescens*).

elongated bill, their small head and slender neck, clothed with very short feathers, give them a different air. The plumage is generally inconspicuous: some tint of brown, ranging from rufous to slaty, and often more or less closely barred with a darker shade or black, is the usual style of coloration; but some species are characterized by a white throat or a bay breast. The wings are short and rounded, and in some forms the feathers of the tail, which in all are hidden by their coverts, are soft. In bearing and gait the birds show some resemblance to their distant relatives the Ratitae, and A. D. Bartlett showed (*Proc. Zool. Soc.*, 1868, p. 115, pl. xii.) that this is especially seen in the newly hatched young. He also noticed the still stronger Ratite character, that the male takes on himself the duty of incubation. The eggs are very remarkable objects, curiously unlike those of other birds; and their shell looks as if it were of highly-burnished metal or glazed porcelain, presenting also various colours, which seem to be constant in the particular species, from pale primrose to sage-green or light indigo, or from chocolate brown to pinkish orange. All who have eaten it declare the flesh of the Tinamou to have a most delicate taste, as it has a most inviting appearance, the pectoral muscles being semi-opaque. Of their habits not much has been told. Darwin (*Journ.* ch. iii.) has remarked upon the silliness they show in allowing themselves to be taken, and this is wholly in accordance with what W. K. Parker observes of their brain capacity and is an additional testimony to their low morphological rank. At least one species of Tinamou has bred not infrequently in confinement, and partly successful attempts to naturalize the species *Rhynchotus rufescens* have been made in England. (A. N.)

[1] Brisson and after him Linnaeus confounded this bird, which they had never seen, with the Trumpeter (*q.v.*).

TINCTURE (Fr. *teinture*, Lat. *tinctura*, *tingere*, to dye, stain), the colour with which a substance is dyed; hence, metaphorically, distinctive character or quality. The term is used in heraldry of the metals, *argent*, *or*, of the colours, *gules*, *azure*, *sable*, *vert*, &c., or of the furs, *ermine*, *vair*, &c. Since the 16th century a conventional arrangement of lines and dots gives the equivalents of these tinctures in black and white (see HERALDRY). In medicine, a tincture is a fluid solution of the essential properties of some substance, animal, vegetable or mineral; the menstruum being either alcohol, ether or ammonia; the various kinds are accordingly distinguished as alcoholic, etherial or ammoniated tinctures.

TINDAL, MATTHEW (d. 1733), English deist, the son of a clergyman, was born at Beer Ferrers (Ferris), Devonshire, probably in 1653. He studied law at Lincoln College, Oxford, under the high churchman George Hickes, dean of Worcester; in 1678 he was elected fellow of All Souls College. About 1685 he saw "that upon his High Church notions a separation from the Church of Rome could not be justified," and accordingly he joined the latter. But discerning "the absurdities of popery," he returned to the Church of England at Easter 1688. His early works were an *Essay of Obedience to the Supreme Powers* (1694); an *Essay on the Power of the Magistrate and the Rights of Mankind in Matters of Religion* (1697); and *The Liberty of the Press* (1698). The first of his two larger works, *The Rights of the Christian Church associated against the Romish and all other priests who claim an independent power over it*, pt. i., appeared anonymously in 1706 (2nd ed., 1706; 3rd, 1707; 4th, 1709). The book was regarded in its day as a forcible defence of the Erastian theory of the supremacy of the state over the Church, and at once provoked criticism and abuse. After several attempts to proscribe the work had failed, a case against the author, publisher and printer succeeded on the 12th of December 1707, and another against a bookseller for selling a copy the next day. The prosecution did not prevent the issue of a fourth edition and gave the author the opportunity of issuing *A Defence of the Rights of the Christian Church*, in two parts (2nd ed., 1709). The book was, by order of the House of Commons, burned, along with Sacheverell's sermon, by the common hangman (1710). It continued to be the subject of denunciation for years, and Tindal believed he was charged by Dr Gibson, bishop of London, in a *Pastoral Letter*, with having undermined religion and promoted atheism and infidelity—a charge to which he replied in the anonymous tract, *An Address to the Inhabitants of London and Westminster*, a second and larger edition of which appeared in 1730. In this tract[2] he makes a valiant defence of the deists, and anticipates

[2] *A Second Address to the Inhabitants*, &c., with replies to some of the critics of that book, bears the same date (1730), though some of the works it refers to appeared in 1731.

here and there his *Christianity as Old as the Creation; or, the Gospel a Republication of the Religion of Nature* (London, 1730, 2nd ed., 1731; 3rd, 1732; 4th, 1733), which was regarded as the "Bible" of deism. It was really only the first part of the whole work, and the second, though written and entrusted in manuscript to a friend, never saw the light. The work evoked many replies, of which the ablest were by James Foster (1730), John Conybeare (1732), John Leland (1733) and Bishop Butler (1736). It was translated into German by J. Lorenz Schmidt (1741), and from it dates the influence of English deism on German theology. Tindal had probably adopted the principles it expounds before he wrote his essay of 1697. He claimed the name of "Christian deist," holding that true Christianity is identical with the eternal religion of nature. He died at Oxford on the 16th of August 1733.

The religious system expounded in *Christianity as Old as the Creation*, unlike the earlier system of Lord Herbert of Cherbury, was based on the empirical principles of Locke. It assumed the traditional deistic antitheses of external and internal, positive and natural, revelations and religions, and perpetuated at the same time the prevalent misconceptions as to the nature of religion and revelation. The system was worked out by the a priori method, with an all but total disregard of the facts of religious history. It starts from the assumptions that true religion must, from the nature of God and things, be eternal, universal, simple and perfect; that this religion can consist of nothing but the simple and universal duties towards God and man, the first consisting in the fulfilment of the second—in other words, the practice of morality. The author's moral system, somewhat confused and inconsistent, is essentially utilitarian. True revealed religion is simply a republication of the religion of nature or reason, and Christianity, if it is the perfect religion, can only be that republication, and must be as old as creation. The special mission of Christianity, therefore, is simply to deliver men from the superstition which had perverted the religion of nature. True Christianity must be a perfectly "reasonable service," reason must be supreme, and the Scriptures as well as all religious doctrines must submit; only those writings can be regarded as divine Scripture which tend to the honour of God and the good of man. The strength of Tindal's position was the conviction of the essential harmony between man's religious and rational nature. Its weakness from the standpoint of modern theology was that, like the whole religious philosophy of the time, it was founded on a misconception of religion and revelation, and on a disregard of the course of man's religious development.

See works quoted under Deism.

TINDER (O. Eng. *tyndre*, from *tindan, tendan*, to *kindle*, cf. Dan. *tonder*, Ger. *anzünden*), a term applied to any dry substance that will readily take light from a spark and so be used for kindling a fire. Before the invention of matches (see Match) fire or light was procured by the ignition of tinder through sparks obtained by the striking of flint against steel, the whole apparatus of tinder, flint and steel being contained in a metal box, which was an essential utensil of all households and was also carried on the person of everyone who might require a light in an emergency. The usual material of "tinder" was a mass of charred linen, but the term was also applied to "touchwood," or wood converted into an easily ignitible consistency by the action of certain fungi. Another form of "tinder" was "touchpaper," paper dipped in nitre and used as a slow-match for igniting gunpowder. In both these words "touch" stands for an earlier *tach, tache* or *tasshe*, tinder, of which the origin is unknown. It may be related to Du. *tak*, bough, twig, and would thus mean dried twigs used as tinder.

TINEO, a town of northern Spain, in the province of Oviedo; on a small tributary of the river Narcea, among the northern outliers of the Cantabrian Mountains, and on the high road from Cangas de Tineo to the Biscayan port of Cudillero. Pop. (1900), 21,865. Mining, agriculture and stock-rearing are the principal industries.

TINKER, an itinerant mender of kettles, pots, pans, &c. The name means simply one who makes a tinkling sound as he mends the vessels, and the word is found as "tinkler" in the 16th century. From early times "tinkers" were looked on as vagabonds, and were so classed in the act of Elizabeth against vagrancy.

TINNÉ, ALEXANDRINE PETRONELLA FRANCINA (1839–1869), Dutch traveller in Africa, born at the Hague on the 17th of October 1839, was the daughter of Philip F. Tinné, a Dutch merchant who settled in England during the Napoleonic wars, but afterwards returned to his native land, and of his wife, Baroness Van Steengracht-Capellan. Her father died when she was five years old, leaving her the richest heiress in the Netherlands. After travelling in Norway, Italy and the East, and visiting Egypt, when she ascended the Nile to near Gondokoro, Miss Tinné left Europe again in 1861 for the Nile regions. Accompanied by her mother and her aunt, she set out from Cairo on the 9th of January 1862. After a short stay at Khartum the party ascended the White Nile to a point above Gondokoro, and explored a part of the Sobat, returning to Khartum in November. Baron Theodor von Heuglin (*q.v.*) and Dr H. Steudner having meantime joined the ladies at Khartum, the whole party set out in February 1863 for the Bahr-el-Ghazal. The intention was to explore that region and ascertain how far westward the Nile basin extended; also to investigate the reports of a vast lake in Central Africa eastwards of those already known—reports referring in all probability to the lake-like expanses of the middle Congo.

Ascending the Bahr-el-Ghazal the limit of navigation was reached on the 10th of March. From Meshra-er-Rek a journey was made overland, across the Bahr Jur and south-west by the Bahr Kosango, to Jebel Kosango, on the borders of the Niam-Niam country. During the journey all the travellers suffered severely from fever. Steudner died in April and Madame Tinné in June, and after many fatigues and dangers the remainder of the party reached Khartum in July 1864, where Miss Tinné's aunt died. Miss Tinné returned to Cairo by Berber and Suakin. The geographical and scientific results of the expedition were highly important, as will be seen in Heuglin's *Die Tinnésche Expedition im westlichen Nilgebiet* (*1863–1864* (Gotha, 1865), and *Reise in das Gebiet des Weissen Nils* Leipzig, 1869). A description, by T. Kotschy and J. Peyritsch, of some of the plants discovered by the expedition was published at Vienna in 1867 under the title of *Plantes Tinnéennes.* At Cairo Miss Tinné lived in Oriental style during the next four years, visiting Algeria, Tunisia and other parts of the Mediterranean. In January 1869 she started from Tripoli with a caravan, intending to proceed to Lake Chad, and thence by Wadai, Darfur and Kordofan to the upper Nile. On the 1st of August, however, on the route from Murzuk to Ghat, she was murdered, together with two Dutch sailors, by Tuareg in league with her escort, who believed that her iron water tanks were filled with gold.

See John A. Tinné's *Geographical Notes of an Expedition in Central Africa by three Dutch Ladies* (Liverpool, 1864), and Sir H. H. Johnston, *The Nile Quest*, ch. xvi. (London, 1903).

TINNEVELLY, a town and district of British India, in the Madras presidency. The town is on the left bank of the Tambraparni river, on the other side of which is Palamcottah, the administrative headquarters of the district. Pop. (1901), 40,469. It is the terminus of a branch of the South Indian railway, 444 m. S.W. of Madras. Its most noteworthy building is a beautifully sculptured temple of Siva.

The District of Tinnevelly has an area of 5389 sq. m. It is for the most part a plain with an average elevation of 200 ft., sloping to the east with slight undulations. It is watered by numerous short streams, the principal being the Tambraparni with a length of 80 m. The chief irrigation work is the Srivaikuntam anicut or dam on this river. In the north the scenery is unattractive and the soil poor; in the south red sandy soil prevails in which little save the Palmyra palm will grow. This palm yields toddy as well as a coarse sugar. Along the banks of the rivers are rice-fields and a variety of trees and crops; and coffee is grown on the slopes of the Travancore hills. The district contains many ancient and magnificent buildings. But the most interesting antiquities are the large sepulchral earthen urns of prehistoric races, which have been found at several places, especially along the course of the Tambraparni; they contain bones, pottery, beads and bronze ornaments, iron weapons, implements, &c. The South Indian railway has its maritime terminus at Tuticorin, the chief seaport. The principal exports are rice to Ceylon and cotton to Japan and Europe. In 1901 the population was 2,059,607, showing an increase of 8% in the decade. The number of native Christians was 159,213, Tinnevelly being the most Christian district in India. The Society for the Propagation of the Gospel and the Church Missionary Society have important and flourishing stations at Tinnevelly town and Palamcottah, as also have the Jesuits. It was here that St Francis Xavier began his preaching in India. The Shanans, or caste of toddy-drawers, have supplied many converts to Christianity. In 1899 their treatment by the Vellalars, or cultivating caste, led to serious riots and bloodshed.

The early history of Tinnevelly is mixed up with that of Madura and Travancore. Down to 1781 it is a confused tale of anarchy and bloodshed. In that year the nawab of Arcot assigned the revenues to the East India Company, which then undertook the internal administration. Several risings subsequently took place, and in 1801 the whole Carnatic, including Tinnevelly, was ceded to the British.

TIN-PLATE and **TERNE-PLATE.** Tin-plate consists of sheets of iron or steel which have been thinly coated with tin by being dipped in a molten bath of that metal. Terne-plate is a similar product, but the bath is not of tin, but of tin and lead mixed, the latter metal constituting from 75–90% of the whole; it has not the bright lustre of tin-plate, whence its name, from *terne*, dull, tarnished. The sheets employed in the manufacture are known as "black plates," and are now of steel, either Bessemer or open-hearth. Formerly iron was used, and was of two grades, coke-iron and charcoal-iron; the latter, being the better, received a heavier coating of tin, and this circumstance is the origin of the terms "coke plates" and "charcoal plates" by which the quality of tin-plate is still designated, although iron is no longer used. Tin-plate is consumed in enormous quantities for the manufacture of the tin cans in which preserved meat, fish, fruit, biscuits, cigarettes and numerous other products are packed, and also for the household utensils of various kinds made by the tinsmith or silversmith; terne-plates, which began to be produced in England about the middle of the 19th century, are widely employed in America for roofing purposes.

The manufacture of tin-plate was long a monopoly of Bohemia, but about 1620 the industry spread to Saxony. In 1665 Andrew Yarranton (1616–1684?), an English engineer and agriculturist, was commissioned to go to Saxony and if possible discover the methods employed. According to his own account (*England's Improvement*, pt. ii. 1681), he was "very civilly treated" and was allowed to see the whole process. On his return to England his friends undertook the manufacture on an experimental scale, but though they were successful they had to abandon it, because their method became known and a patent for it was "trumpt up" by a rival, who, however, from lack of technical skill was unable to work it. Half a century later the manufacture was revived by Major John Hanbury (1664–1734) at Pontypool; the "method of rolling iron plates by means of cylinders," said to have been devised by him, enabled more uniform black plates to be produced than was possible with the old plan of hammering, and in consequence the English tin-plate became recognized as superior to the German. During the next hundred years or so the industry spread steadily in England and Wales, and after 1834 its expansion was rapid, especially in Wales, Great Britain becoming the chief source of the world's supply. In that year her total production was 180,000 boxes of 108 ℔ each (in America a box is 100 ℔), in 1848 it was 420,000 boxes, in 1860 it reached 1,700,000 boxes, in 1870 nearly 3,460,000 boxes, and in 1890 it exceeded 9,500,000 boxes. In the United States the manufacture of tin- and terne-plates did not make much way until about 1890, and up to 1892 the bulk of the supply was imported from Great Britain. But subsequently the advance was rapid, and the production, which was about 2,236,000 ℔ in 1891, had by 1900 increased to more than 849,000,000 ℔, of which over 141,000,000 ℔ were terne-plates. The total imports in that year were only 135,264,881 ℔. In later years, again, there was a decline in the American production, and in 1907 only 20% of the American tin-plate mills were at work, while the British production reached 14 million boxes.

There are two processes for the tinning of the black plates. In the "palm-oil" process, which is the older, the plates, after being properly annealed, are scoured with sand and water and pickled in dilute sulphuric acid alternately until they are perfectly clean and bright. They are then washed in water, and after being boiled in palm oil to remove all traces of acid and water are dipped into a bath of molten tin, covered with oil to prevent oxidation. They are then taken to a second bath containing purer tin than the first. After this they are scoured with a hempen rubber and dipped in a third bath containing the purest tin of all; then they are passed through rolls to finish the surface and regulate the thickness of the coating. As the tin in the third bath becomes alloyed with iron from the operation, it is removed into the second, pure fresh tin being substituted; and similarly the metal of the second, as the amount of iron in it increases, is removed to the first. In the "acid process" only a single bath of tin is required. The molten metal is covered with a layer of muriate of zinc, which acts as the flux, and by means of rolls the plates are passed through this down into the tin, to be brought out at another point in the bath where there is a layer of oil on the surface.

TINTAGEL, or Trevena, a village in the Launceston parliamentary division of Cornwall, England, on the north coast, 4½ m. from Camelford. Pop. (1901), 868. It stands on a bare upland, close to the sea; and below it is Tintagel Haven, or Porth, a small cove surrounded by cliffs of almost black slate. The scanty ruins of a castle are built partly on the mainland, partly on a rugged promontory spoken of as the Island, but united by a narrow peninsula to the shore. They have been celebrated as the birthplace of King Arthur, or as the stronghold of King Mark, in a host of medieval romances, and in the poems of Tennyson and Swinburne. The Norman walls are so darkened and weathered that, from a little distance, they seem a part of the rock itself. Portions of a chapel remain, dating from the 13th century, and including a porch and a stone altar; while beside it are traces of a tomb hewn out of the slate, and of some domestic building which had a staircase and a pointed arch above the door. The cruciform parish church of St Marcelliana stands on a high cliff, west of the castle. Although it has been restored, there remain traces of Saxon workmanship in the chancel, besides two Norman doorways, a font of the same period, a stone altar bearing five crosses and a fine 15th-century brass. In the churchyard the graves are buttressed, storms being frequent and violent on this unprotected coast. For a time the church belonged to Fontevrault Abbey in Normandy; but it was made over by Edward IV. to the collegiate church of Windsor. A 9th-century roodstone stands in the village. Portions of the vicarage date from the 14th century, and in its garden there is a stone dovecote of great age. A little slate is quarried, being taken from the rocks below the church, and exported in the small vessels which can visit Tintagel Haven in calm weather. The magnificence of the coast has inspired more than one famous painting.

Tintagel (Tintajol, Dundagel) is a parish a portion of which appears in the Domesday Survey as Bossiney (Botcinnu). The latter was held in the time of the Confessor by a thegn of St Petrock and at the time of the survey by Robert, count of Mortain, of the same saint. The castle probably existed in pre-Saxon times. Under the Norman earls of Cornwall this was rebuilt, embattled and furnished with munitions of war. Its officers included a constable and a chaplain. It was in a ruinous condition in Leland's time (*c.* 1540). Queen Elizabeth abolished the office of constable. In the parish of Tintagel is the hamlet of Bossiney which under the name of Tintagel received a charter (undated) from Richard king of the Romans, granting freedom to the borough and to the burgesses freedom from pontage and stallage throughout Cornwall, a market on Wednesdays and a three days' fair at Michaelmas. This charter was confirmed in 1386. In 1333 the burgesses, those who held tenements within the borough, numbered 100. The borough, which apparently owed its existence to the castle, shared its fortunes. Leland calls attention to the decay of a great number of houses. Its charter was surrendered to Charles II. and a new one obtained from his brother in 1685. Under the latter a mayor, recorder, six common councillors, a coroner, six freemen and a common clerk were to constitute the corporation. For supplying vacancies in it the votes of those only who were members of it were required. Provision was made for the administration of the borough. Bossiney acquired the right of electing two members of parliament in 1553, the franchise being originally vested in the freeholders within the borough. By the middle of the

18th century the franchise had become restricted to the freemen or burgesses. In 1784 the vicar of Tintagel, as mayor and only qualified elector, enjoyed the probably unique privilege of returning two members to the House of Commons. In 1832 there were ten resident legal voters within the borough and nine out-voters. The Reform Act transferred their votes to the county. There is now no market, and the only fair is held on the 21st of October.

See *Victoria County History: Cornwall;* Sir J. Maclean, *History of Trigg Minor.*

TINTERN ABBEY, in Monmouthshire, one of the most famous ecclesiastical ruins in England. It is beautifully situated on the right bank of the river Wye. The abbey was founded by Walter de Clare in 1131 for Cistercian monks. The existing church, however, dates from the later part of the 13th century; it is unroofed, and the nave is imperfect, but many of the finest details of a style transitional from Early English to Decorated are preserved. The church is cruciform. Cloisters and other monastic buildings, of which there are considerable remains, lay to the north of the church. The foundation was dissolved by Henry VIII. At the neighbouring village of Tintern Parva there is a station on a branch of the Great Western railway.

TINTORETTO, JACOPO ROBUSTI (1518–1594), one of the greatest painters of the Venetian school, was born in Venice in 1518, though most accounts say in 1512. His father, Battista Robusti, was a dyer, or " tintore "; hence the son got the nickname of " Tintoretto," little dyer, or dyer's boy, which is Englished as Tintoret. In childhood Jacopo, a born painter, began daubing on the dyer's walls; his father, noticing his bent, took him round, still in boyhood, to the studio of Titian, to see how far he could be trained as an artist. We may suppose this to have been towards 1533, when Titian was already (according to the ordinary accounts) fifty-six years of age. Ridolfi is our authority for saying that Tintoret had only been ten days in the studio when Titian sent him home once and for all. The reason, according to the same writer, is that the great master observed some very spirited drawings, which he learned to be the production of Tintoret; and it is inferred that he became at once jealous of so promising a scholar. This, however, is mere conjecture; and perhaps it may be fairer to suppose that the drawings exhibited so much independence of manner that Titian judged that young Robusti, although he might become a painter, would never be properly a pupil. From this time forward the two always remained upon distant terms—Robusti being indeed a professed and ardent admirer of Titian, but never a friend, and Titian and his adherents turning the cold shoulder to Robusti. Active disparagement also was not wanting, but it passed unnoticed by Tintoret. The latter sought for no further teaching, but studied on his own account with laborious zeal; he lived poorly, collecting casts, bas-reliefs, &c., and practising by their aid. His noble conception of art and his high personal ambition were evidenced in the inscription which he placed over his studio—" Il disegno di Michelangelo ed il colorito di Tiziano " (Michelangelo's design and Titian's colour). He studied more especially from models of Michelangelo's " Dawn," " Noon," " Twilight " and " Night," and became expert in modelling in wax and clay—a method (practised likewise by Titian) which afterwards stood him in good stead in working out the arrangement of his pictures. The models were sometimes taken from dead subjects dissected or studied in anatomy schools; some were draped, others nude, and Robusti was wont to suspend them in a wooden or cardboard box, with an aperture for a candle. Now and afterwards he very frequently worked by night as well as by day. The young painter Schiavone, four years Robusti's junior, was much in his company. Tintoret helped Schiavone gratis in wall-paintings; and in many subsequent instances he worked also for nothing, and thus succeeded in obtaining commissions. The two earliest mural paintings of Robusti—done, like others, for next to no pay—are said to have been " Belshazzar's Feast " and a " Cavalry Fight," both long since perished. Such, indeed, may be said to have been the fate of all his frescoes, early or later. The first work of his which attracted some considerable notice was a portrait-group of himself and his brother—the latter playing a guitar—with a nocturnal effect; this also is lost. It was followed by some historical subject, which Titian was candid enough to praise. One of Tintoret's early pictures still extant is in the church of the Carmine in Venice, the " Presentation of Jesus in the Temple "; also in S. Benedetto are the " Annunciation " and " Christ with the Woman of Samaria." For the Scuola della Trinità (the scuole or schools of Venice were more in the nature of hospitals or charitable foundations than of educational institutions) he painted four subjects from Genesis. Two of these, now in the Venetian Academy, are " Adam and Eve " and the " Death of Abel," both noble works of high mastery, which leave us in no doubt that Robusti was by this time a consummate painter—one of the few who have attained to the highest eminence by dire study of their own, unseconded by any training from some senior proficient.

Towards 1546 Robusti painted for the church of the Madonna dell' Orto three of his leading works—the " Worship of the Golden Calf," the " Presentation of the Virgin in the Temple," and the " Last Judgment "—now shamefully repainted; and he settled down in a house hard by the church. It is a Gothic edifice, looking over the lagoon of Murano to the Alps, built in the Fondamenta de' Mori, still standing, but let out cheap to artisans. In 1548 he was commissioned for four pictures in the Scuola di S. Marco—the " Finding of the body of St Mark in Alexandria " (now in the church of the Angeli, Murano), the " Saint's Body brought to Venice," a " Votary of the Saint delivered by invoking him from an Unclean Spirit " (these two are in the library of the royal palace, Venice), and the highly and justly celebrated " Miracle of the Slave." This last, which forms at present one of the chief glories of the Venetian Academy, represents the legend of a Christian slave or captive who was to be tortured as a punishment for some acts of devotion to the evangelist, but was saved by the miraculous intervention of the latter, who shattered the bone-breaking and blinding implements which were about to be applied. These four works were greeted with signal and general applause, including that of Titian's intimate, the too potent Pietro Aretino, with whom Tintoret, one of the few men who scorned to curry favour with him, was mostly in disrepute. It is said, however, that Tintoret at one time painted a ceiling in Pietro's house; at another time, being invited to do his portrait, he attended, and at once proceeded to take his sitter's measure with a pistol (or a stiletto), as a significant hint that he was not exactly the man to be trifled with. The painter having now executed the four works in the Scuola di S. Marco, his straits and obscure endurances were over. He married Faustina de' Vescovi, daughter of a Venetian nobleman. She appears to have been a careful housewife, and one who both would and could have her way with her not too tractable husband. Faustina bore him several children, probably two sons and five daughters.

The next conspicuous event in the professional life of Tintoret is his enormous labour and profuse self-development on the walls and ceilings of the Scuola di S. Marco, a building which may now almost be regarded as a shrine reared by Robusti to his own genius. The building had been begun in 1525 by the Lombardi, and was very deficient in light, so as to be particularly ill-suited for any great scheme of pictorial adornment. The painting of its interior was commenced in 1560. In that year five principal painters, including Tintoret and Paul Veronese, were invited to send in trial-designs for the centre-piece in the smaller hall named Sala dell' Albergo, the subject being S. Rocco received into Heaven. Tintoret produced not a sketch but a picture, and got it inserted into its oval. The competitors remonstrated, not unnaturally; but the artist, who knew how to play his own game, made a free gift of the picture to the saint, and, as a by-law of the foundation prohibited the rejection of any gift, it was retained *in situ*—Tintoret furnishing gratis the other decorations of the same ceiling. (This is one version of the anecdote: there is another version, which, though differing in incident, has the like general bearing.) In 1565 he resumed work at the scuola, painting the magnificent " Crucifixion," for which a sum of

250 ducats was paid. In 1576 he presented gratis another centre-piece—that for the ceiling of the great hall, representing the "Plague of Serpents"; and in the following year he completed this ceiling with pictures of the "Paschal Feast" and "Moses striking the Rock"—accepting whatever pittance the confraternity chose to pay. Robusti next launched out into the painting of the entire scuola and of the adjacent church of S. Rocco. He offered in November 1577 to execute the works at the rate of 100 ducats per annum, three pictures being due in each year. This proposal was accepted and was punctually fulfilled, the painter's death alone preventing the execution of some of the ceiling-subjects. The whole sum paid for the scuola throughout was 2447 ducats. Disregarding some minor performances, the scuola and church contain fifty-two memorable paintings, which may be described as vast suggestive sketches, with the mastery, but not the deliberate precision, of finished pictures, and adapted for being looked at in a dusky half-light. "Adam and Eve," the "Visitation," the "Adoration of the Magi," the "Massacre of the Innocents," the "Agony in the Garden," "Christ before Pilate," "Christ carrying His Cross," and (this alone having been marred by restoration) the "Assumption of the Virgin" are leading examples in the scuola; in the church, "Christ curing the Paralytic."

It was probably in 1560, the year in which he began working in the Scuola di S. Rocco, that Tintoret commenced his numerous paintings in the ducal palace; he then executed there a portrait of the doge, Girolamo Priuli. Other works which were destroyed in the great fire of 1577 succeeded—the "Excommunication of Frederick Barbarossa by Pope Alexander III." and the "Victory of Lepanto." After the fire Tintoret started afresh, Paul Veronese being his colleague; their works have for the most part been disastrously and disgracefully retouched of late years, and some of the finest monuments of pictorial power ever produced are thus degraded to comparative unimportance. In the Sala dello Scrutinio Robusti painted the "Capture of Zara from the Hungarians in 1346 amid a Hurricane of Missiles"; in the hall of the senate, "Venice, Queen of the Sea"; in the hall of the college, the "Espousal of St Catherine to Jesus"; in the Sala dell' Anticollegio, four extraordinary masterpieces—"Bacchus, with Ariadne crowned by Venus," the "Three Graces and Mercury," "Minerva discarding Mars," and the "Forge of Vulcan"—which were painted for fifty ducats each, besides materials, towards 1578; in the Antichiesetta, "St George and St Nicholas, with St Margaret" (the female figure is sometimes termed the princess whom St George rescued from the dragon), and "St Jerome and St Andrew"; in the hall of the great council, nine large compositions, chiefly battle-pieces. We here reach the crowning production of Robusti's life, the last picture of any considerable importance which he executed, the vast "Paradise," in size 74 ft. by 30, reputed to be the largest painting ever done upon canvas. It is a work so stupendous in scale, so colossal in the sweep of its power, so reckless of ordinary standards of conception or method, so pure an inspiration of a soul burning with passionate visual imagining and a hand magical to work in shape and colour, that it has defied the connoisseurship of three centuries, and has generally (though not with its first Venetian contemporaries) passed for an eccentric failure; while to a few eyes (including those of the present writer) it seems to be so transcendent a monument of human faculty applied to the art pictorial as not to be viewed without awe nor thought of without amazement. While the commission for this huge work was yet pending and unassigned Robusti was wont to tell the senators that he had prayed to God that he might be commissioned for it, so that paradise itself might perchance be his recompense after death. Upon eventually receiving the commission in 1588 he set up his canvas in the Scuola della Misericordia and worked indefatigably at the task, making many alterations and doing various heads and costumes direct from nature. When the picture had been brought well forward he took it to its proper place and there finished it, assisted by his son Domenico for details of drapery, &c. All Venice applauded the superb achievement, which has in more recent times suffered from neglect, but fortunately hardly at all from restoration. Robusti was asked to name his own price, but this he left to the authorities. They tendered a handsome amount; Robusti is said to have abated something from it, which is even a more curious instance of ungreediness for pelf than earlier cases which we have cited where he worked for nothing at all.

After the completion of the "Paradise" Robusti rested for a while, and he never undertook any other work of importance, though there is no reason to suppose that his energies were exhausted had his days been a little prolonged. He was seized with an attack in the stomach, complicated with fever, which prevented him from sleeping and almost from eating for a fortnight, and on the 31st of May 1594 he died. A contemporary record states his age to have been seventy-five years and fifteen days. If this is accurate, the 16th of May 1519 must have been the day of his birth; but we prefer the authority of the register of deaths in S. Marciliano, which states that Tintoret died of fever, aged seventy-five years, eight months and fifteen days—thus bringing us to the 16th of September 1518 as the true date of his birth. He was buried in the church of the Madonna dell' Orto by the side of his favourite daughter Marietta, who had died in 1590, aged thirty; there is a well-known tradition that as she lay dead the heart-stricken father painted her portrait. Marietta had herself been a portrait-painter of considerable skill, as well as a musician, vocal and instrumental; but few of her works are now traceable. It is said that up to the age of fifteen she used to accompany and assist her father at his work, dressed as a boy; eventually she married a jeweller, Mario Augusta. In 1866 the grave of the Vescovi and Robusti was opened, and the remains of nine members of the joint families were found in it; a different locality, the chapel on the right of the choir, was then assigned to the grave.

Tintoret painted his own portrait at least twice, one of the heads being in the Uffizi Gallery of Florence and the other, done when his age was advanced, in the Louvre. It is a very serious face, somewhat blunt and rugged, but yet refined without the varnish of elegance—concentrated and resolute, its native ardours of frankness and energy welded down into lifelong laboriousness, with a pent look as of smouldering fire. The eyes are large, dark and round; the grizzled hair close and compact. The face has been held to bear some resemblance to that of Michelangelo, but this does not go very far. Robusti appears also as one of the figures in the two vast pictures by Paul Veronese—the "Marriage in Cana" and the "Feast in the House of Levi."

Audacious and intrepid, though not constantly correct, as a draughtsman, majestically great as a colourist, prodigious as an executant, Tintoret was as absolute a type of the born painter as the history of art registers or enables us to conceive. Whatever he did was imaginative—sometimes beautiful and suave (and he was eminently capable of painting a lovely female countenance or an heroic man), often imposing and romantic, fully as often turbulent and reckless, sometimes trivial, never unpainter-like or prosaic. When he chose—which was not always—he painted his entire personages characteristically; but, like the other highest masters of Venice, he conceded and attended little to the expression of his faces as evincing incidental emotion. In several of his works—as especially the great "Crucifixion" in S. Rocco—there is powerful central thought, as well as inventive detail; but his imagination is always concrete: it is essentially that of a painter to whom the means of art—the form, colour, chiaroscuro, manipulation, scale, distribution—are the typical and necessitated realities. What he imagines is always a visual integer, a picture—never a treatise, however thoughtfully planned or ingeniously detailed. Something that one could see—that is his ideal, not something that one could narrate, still less that one could deduce and demonstrate. In his treatment of action or gesture the most constant peculiarity is the sway and swerve of his figures: they bend like saplings or rock like forest-boughs in a gale; stiffness or immobility was entirely foreign to his style, which has therefore little of the monumental or severe character. Perhaps he felt that there was no other way for combining "the colour of Titian with the design of Michelangelo." The knitted strength and the transcendent fervour of energy of the supreme Florentine might to some extent be emulated; but, if they were to be united with the glowing fusion of hue of the supreme Venetian, this could only be attained by a process of relaxing the excessive tension and modifying muscular into elastic force. In this respect he was a decided innovator; but he had many imitators, comparatively feeble if we except Paul Veronese.

Tintoret scarcely ever travelled out of Venice. He loved all the arts, played in youth the lute and various instruments, some of them of his own invention, and designed theatrical costumes and properties, was versed in mechanics and mechanical devices, and was a very agreeable companion. For the sake of his work he lived in a most retired fashion, and even when not painting was wont to remain in his working room surrounded by casts. Here he hardly admitted any, even intimate friends, and he kept his modes of work secret, save as regards his assistants. He abounded in pleasant witty sayings whether to great personages or to others, but no smile hovered on his lips. Out of doors his wife made him wear the robe of a Venetian citizen; if it rained she tried to induc him with an outer garment, but this he resisted. She would also when he left the house wrap up money for him in a handkerchief, and on his return expected an account of it; Tintoret's accustomed reply was that he had spent it in alms to the poor or to prisoners. In 1574 he obtained the reversion of the first vacant broker's patent in a fondaco, with power to bequeath it—an advantage granted from time to time to pre-eminent painters. For his phenomenal energy in painting he was termed "Il Furioso." An agreement is extant showing that he undertook to finish in two months two historical pictures each containing twenty figures, seven being portraits. The number of his portraits is enormous; their merit is unequal, but the really fine ones cannot be surpassed. Sebastiano del Piombo remarked that Robusti could paint in two days as much as himself in two years; Annibale Caracci that Tintoret was in many pictures equal to Titian, in others inferior to Tintoret. This was the general opinion of the Venetians, who said that he had three pencils—one of gold, the second of silver and the third of iron. The only pictures (if we except his own portrait) on which he inscribed his name are the "Miracle of Cana" in the church of the Salute (painted originally for the brotherhood of the Crociferi), the "Miracle of the Slave," and the "Crucifixion" in the Scuola di S. Rocco; the last was engraved in 1589 by Agostino Caracci. Generally he painted at once on to the canvas without any preliminary. Some of his dicta on art have been recorded as follows by Ridolfi: "the art of painting remains increasingly difficult"; "painters in youth should adhere to the best masters, these being Michelangelo and Titian, and should be strict in representing the natural forms"; "the first glance at a picture is the crucial one"; "black and white, as developing form, are the best of colours"; "drawing is the foundation of a painter's work, but drawing from life in the nude should only be essayed by well-practised men, as the real is often wanting in beauty."

Of pupils Robusti had very few; his two sons and Martin de Vos of Antwerp were among them. Domenico Robusti (1562–1637), whom we have already had occasion to mention, frequently assisted his father in the groundwork of great pictures. He himself painted a multitude of works, many of them on a very large scale; they would at best be mediocre, and, coming from the son of Tintoret, are exasperating; still, he must be regarded as a considerable sort of pictorial practitioner in his way.

We conclude by naming a few of the more striking of Tintoret's very numerous works not already specified in the course of the article. In Venice (S. Giorgio Maggiore), a series of his later works, the "Gathering of the Manna," "Last Supper," "Descent from the Cross," "Resurrection," "Martyrdom of St Stephen," "Coronation of the Virgin," "Martyrdom of St Damian"; (S. Francesco del Vigna) the "Entombment"; (the Frari) the "Massacre of the Innocents"; (S. Cassano) a "Crucifixion," the figures seen from behind along the hill slope; (St Mark's) a mosaic of the "Baptism of Christ"—the oil-painting of this composition is in Verona. In Milan (the Brera), "St Helena and other saints." In Florence (Pitti Gallery), "Venus," "Vulcan" and "Cupid." In Cologne (Wallraff-Richarts Museum), "Ovid and Corinna." In Augsberg (the town-hall), some historical pictures, which biographers and tourists alike have unaccountably neglected—one of the siege of a fortified town is astonishingly fine. In England (Hampton Court), "Esther and Ahasuerus," and the "Nine Muses"; (the National Gallery), "The Origin of the Milky Way," a memorable *tour de force*, "Christ washing Peter's Feet," a grand piece of colour and execution, not greatly interesting in other respects, also a spirited smallish work, "St George and the Dragon."

The writer who has done by far the most to establish the fame of Tintoret at the height which it ought to occupy is Ruskin in his *Stones of Venice* and other books; the depth and scope of the master's power had never before been adequately brought out, although his extraordinarily and somewhat arbitrarily used executive gift was acknowledged. Ridolfi (Meraviglie dell' Arte) gives interesting personal details; the article by Dr Janitschek in *Kunst und Künstler* (1876) is a solid account. For an English reader the most handy narrative is that of W. R. Osler (*Tintoretto*, 1879), in the series entitled "The Great Artists." Here the biographical facts are clearly presented; the aesthetic criticism is enthusiastic but not perspicuous. Other works deserving of mention are: L. Mesnard, *Étude sur Tintoret* (1881); T. P. Stearns, *Four Great Venetians* (1901); H. Thode, *Tintoretto* (1901); Stoughton Holborn, *Jacopo Robusti* (1903). (W. M. R.)

TIPASA. (1) A town and commune on the coast of Algeria, in the department of Algiers, 30 m. W. of the capital. Pop. of the commune (1906), 2725. The modern town, founded in 1857, is remarkable chiefly for its pleasant situation and sandy beach. The roadstead is exposed to the N.E. and N.W. There is a mole about 90 ft. long and anchorage in six fathoms. A considerable trade is done. The Roman city of Tipasa was built on three small hills which overlooked the sea. Of the houses, most of which stood on the central hill, no traces remain; but there are ruins of three churches—the Great Basilica and the Basilica Alexander on the western hill, and the Basilica of St Salsa on the eastern hill—two cemeteries, the baths, theatre, amphitheatre and nymphaeum. The line of the ramparts can be distinctly traced and at the foot of the eastern hill the remains of the ancient harbour. The basilicas are surrounded by cemeteries, which are full of coffins, all of stone and covered with mosaics. The basilica of St Salsa, which has been excavated by S. Gsell, consists of a nave and two aisles, and still contains a mosaic. The Great Basilica served for centuries as a quarry, but it is still possible to make out the plan of the building, which was divided into seven aisles. Under the foundations of the church are tombs hewn out of the solid rock. Of these one is circular, with a diameter of 60 ft. and space for 24 coffins.

Tipasa was founded by the Phoenicians, was made a Roman military colony by the emperor Claudius, and afterwards became a municipium. Commercially it was of considerable importance, but it was not distinguished in art or learning. Christianity was early introduced, and in the third century Tipasa was a bishop's see. Most of the inhabitants continued heathens until, according to the legend, Salsa, a Christian maiden, threw the head of their serpent idol into the sea, whereupon the enraged populace stoned her to death. The body, miraculously recovered from the sea, was buried, on the hill above the harbour, in a small chapel which gave place subsequently to the stately basilica. Salsa's martyrdom took place in the 4th century. In 484 the Vandal king Huneric (477–484) sent an Arian bishop to Tipasa; whereupon a large number of the inhabitants fled to Spain, while many of the remainder were cruelly persecuted. After this time the city disappears from history; and, whether or not its ruin was caused by the Arabs, they seem to have made no settlement there.

(2) Another town which in Roman times was called Tipasa is in the department of Constantine, Algeria, 55 m. due south of Bona, 3140 ft. above the sea; it is now called Tifesh. The chief ruin is that of an extensive fortress, the walls of which are 9 ft. thick.

TIP-CAT (also called *Cat* and *Cat and Dog*), a pastime which consists in tapping with a stick a short billet of wood with sharpened ends upon one of these ends, so that it jumps in the air, and then hitting it to the greatest possible distance. There are many varieties of the game, but in the most common the batter, having placed the billet, or *cat*, in a small circle on the ground, *tips* it into the air and hits it to a distance. His opponent then offers him a certain number of points, based upon his estimate of the number of hops or jumps necessary to cover the distance. If the batter thinks the distance underestimated he is at liberty to decline the offer and measure the distance in jumps, and score the number made. The game is one or more hundreds.

TIPPERA (*Tripura*), a native state and also a British district of India, in Eastern Bengal and Assam. The state, which is known as Hill Tippera (*q.v.*), represents that portion of the raja's territory that was never conquered by the Mahommedans. The dynasty, which is of great antiquity, was converted to Hinduism many centuries ago; but the people still profess an aboriginal religion, similar to that of the neighbouring hill tribes. The raja owns an estate of 570 sq. m., yielding an income of more than £40,000, in the British district, where he ranks as an ordinary *zamindar*. His residence is at Agartalla, just within the boundary of Hill Tippera.

The British district of Tippera, with administrative headquarters at Comilla, has an area of 2499 sq. m. It has a flat and open surface, with the exception of the isolated Lālmāi range

(100 feet), and is for the most part laid out in well-cultivated fields, intersected by rivers and *khals* (creeks) partially affected by the tides. In the lowlands the soil is light and sandy; but in the higher parts a deep alluvial soil alternates with bands of clay and sand. The principal rivers are the Meghna, or estuary of the Brahmaputra; and the Gumti, Dākātiā, and Titās, which are also navigable for a considerable portion of their course. There are many marshes or *bils*. The wild animals include tigers, leopards, wild boars and buffaloes. The climate is mild and healthy. In 1901 the population was 2,117,991, showing an increase of 19% in the decade, being the highest rate in the province. Mahommedans form nearly three-fourths of the total. Rice is the staple crop, followed by jute; betel-nut and betel-leaf and chillies are also grown. The chief exports are rice, jute and betel-nuts; and the principal imports cotton goods, salt and kerosene oil.

The eastern border of the district is traversed by the Assam-Bengal railway, with branches from Laksham to Chandpur and Noakhali; but waterways remain the chief means of communication.

Tippera came under the East India Company in 1765; but more than a fifth of its present area was under the immediate rule of the raja of Hill Tippera, who paid a tribute of ivory and elephants. At that time Tippera with Noakhali formed part of Jalalpur, one of Shuja-ud-Din's divisions of the province of Bengal; but in 1822 it was separated, and since then great changes have been made in its boundaries. With the exception of a serious raid in 1860 by the Kukīs or Lushāis, nothing has disturbed the peace of the district.

TIPPERARY, a county of Ireland in the province of Munster, bounded N.W. by Galway, N.E. by King's County, E. by Queen's County and Kilkenny, S. by Waterford, and W. by Cork, Limerick, Clare and Galway. The county is the sixth in size of the Irish counties, having an area of 1,062,963 acres, or about 1661 sq. m. The surface is varied and picturesque. The Knockmealdown Mountains on the southern border reach an elevation of 2609 ft. To the north of this range are the picturesque Galty or Galtee Mountains (Galtymore 3015 ft.). To the east, bordering Kilkenny, are the Slieveardagh Hills, and near Templemore the Devil's Bit Mountains (1583 ft.) with a curious gap on the summit. In the north-west is Keeper Hill, 2278 ft. The greater part of the county, however, is a gently undulating plain. From the rich level country the Rock of Cashel rises boldly. Tipperary has only one considerable river, the Suir, which has its source in the Devil's Bit Mountains, and flows southward and eastward by Templemore, Thurles, Caher, and Clonmel. The Nore, which also rises in the Devil's Bit Mountains, soon passes into Queen's County, and the Shannon forms part of the western border. The Mitchelstown stalactite caverns, discovered accidentally in 1833, attract a large number of visitors. They are in the extreme south-west of the county; take their name from the neighbouring town of Mitchelstown, 6 m. distant in County Cork; and were explored and surveyed by M. Martel, the French speleologist, in 1895.

Geology.—In this county the Carboniferous Limestone is escaping, as it were, from confinement between the Old Red Sandstone ridges of the south, and spreading out northward into the great plain. Its folded character is seen in the anticlinal boss on which the acropolis of Cashel stands; but generally its level surface is covered by boulder-drift. A great denuded dome of Old Red Sandstone, with Silurian exposed across the centre, divides the north of the county, and another similar mass, the Arra Mountains, rises between Nenagh and Lough Derg. The same rocks form the Galtees, Slievenaman and the Knockmealdown Mountains. In the east, Upper Carboniferous shales and sandstones lie along a synclinal axis, from Cashel to Kilkenny, and anthracite is mined on a Coal Measure plateau at Killenaule. The lead-ore mined for many centuries at Silvermines south of Nenagh is silver-bearing, and is associated with zinc blende. Indications of ore have been traced along the junction of the limestone with the older rocks for thirty miles. Good slates are quarried in the Silurian area in Clashnasmuth townland on Slievenaman.

Industries.—Tipperary ranks among the best agricultural districts of Ireland. The subsoil in the lower grounds is limestone, which is overlaid by a rich calcareous loam, capable of yielding the finest crops. The centre of the county is occupied by the Golden Vale, the most fertile district in Ireland, which stretches from Cashel to the town of Limerick. On the higher districts the soil is light and thin, partaking much of the character of the clay slate and sands on which it rests. Detached portions of the Bog of Allen encroach on the north-east of the county. The proportion of tillage to pasture is roughly as 1 to 2½, and the area under the standard crops of oats and potatoes decreases. The area under barley, however, is well maintained, as distillation causes a steady demand for this grain. Turnips are also an important and steady crop. The numbers of cattle, sheep, pigs, goats and poultry also increase generally; and butter-making occupies considerable attention. A few persons are employed in mining, but the occupation of the inhabitants is chiefly agricultural. There is a considerable number of meal and flour mills.

Communications are supplied by the Great Southern & Western railway, the main line of which crosses the county from north-east to south-west by Templemore and Thurles. The Ballybrophy (Queen's County) & Limerick branch from this line serves the north of the county by Roscrea (junction for Birr) and Nenagh. The Waterford & Limerick line passes through the south of the county by way of Clonmel and Tipperary, crossing the main line at Limerick junction. The two lines are also connected by the Thurles, Fethard and Clonmel branch.

Population and Administration.—The population (175,217 in 1891; 160,232 in 1901) shows a serious decrease (though much less so than formerly), and emigration is very heavy. Of the total about 94% are Roman Catholics, and about 76% constitute the rural population. The principal towns are Clonmel (the county town, pop. 10,167), Tipperary (6281), Carrick-on-Suir (5406), Nenagh (4704), Thurles (4411), Cashel (a cathedral city, 2938), Roscrea (2325), Caher (2058), Templemore (2774) and Fethard (1498). Tipperary is divided into a north and south riding, each consisting of six baronies. For parliamentary purposes it is separated into four divisions—East, Mid, North and South—each returning one member. Before the Union in 1800 the county returned two members to the Irish parliament, and the boroughs of Cashel, Clonmel and Fethard two each; afterwards, until the Redistribution Act of 1885, the county returned two members and Cashel and Clonmel one each. Assizes for the north riding are held in Nenagh and for the south riding in Clonmel. Quarter-sessions are held at Cashel, Clonmel, Nenagh, Roscrea, Thurles and Tipperary. Ecclesiastically the county belongs to the Protestant dioceses of Cashel and Killaloe, and the Roman Catholic dioceses of Cashel, Killaloe, Waterford and Lismore.

History and Antiquities.—Tipperary is one of the counties generally considered to have been formed by King John in 1210; in 1328 Edward III. made it a county palatine in favour of the earl of Ormonde; and, though the king shortly afterwards resumed his regal prerogative, the county was regranted in 1337. In 1372 the grant was confirmed to James Butler, earl of Ormonde, the lands belonging to the Church retaining, however, a separate jurisdiction, and being known as the county of Cross Tipperary, or the Cross of Tipperary. In 1621 James I. took the county palatine into his own hands. It was, however, restored in 1664 to James, 12th earl and 1st duke, whose regalities were further made to include the county of the Cross. On the attainder of James, 2nd duke, in 1715, the jurisdiction reverted to the Crown, and the last of the Irish palatinates thus ceased to exist.

There are two round towers within the county—one at Roscrea and the other on the Rock of Cashel. The county is rich in possession of remains of several ecclesiastical foundations of the highest interest. Of these the following are described under the names of the respective towns: the remarkable collection of buildings on and adjacent to the Rock of Cashel; the Cistercian abbey of Holy Cross near Thurles, one of the finest monastic ruins in Ireland; and the abbey and Franciscan friary at Roscrea. The stronghold of Caher, occupied as a barrack, is in good preservation. At Roscrea one of the towers of the castle built by King John remains, and the stronghold of the Ormondes, erected in the reign of Henry VIII., forms the dépot attached to the barracks. The other principal ecclesiastical ruins are the priory of Athassel, founded for Augustinian monks about 1200; and Fethard Abbey, founded in the 14th century, now used as a chapel.

TIPPERARY, a market town of Co. Tipperary, Ireland. Pop. (1901), 6281. It is beautifully situated near the base of the Slieve na muck or Tipperary Hills, a branch of the Galtee range, on the Waterford & Limerick line of the Great Southern & Western railway, 3 m. S.E. of Limerick Junction and 110½ S.W. of Dublin. It is governed by an urban district council. It is situated in the centre of a fine agricultural district, and its butter market ranks next to that of Cork. Condensed milk is manufactured. The town is of great antiquity, but first acquired importance by the erection of a castle by King John, of which there are no remains. A monastery founded for Augustinians by Henry III. gave a second impulse to its growth. The gatehouse, all that remains of this foundation, is the only building of antiquity in the town. Formerly Tipperary was a corporation from a grant made in 1310 by Edward II. New Tipperary was founded outside the town by Mr William O'Brien in 1890 during the "Plan of Campaign" inaugurated to boycott the Smith-Barry estate, in order to accommodate the tenants who vacated their holdings, but the scheme was a failure, and the place was abandoned and sold.

TIPPOO SAHIB (1753–1799), sultan of Mysore, son of Hyder Ali (*q.v.*), was born in 1753. He was instructed in military tactics by French officers in the employment of his father. In 1767 in the invasion of the Carnatic he commanded a corps of cavalry, and he distinguished himself in the Mahratta War of 1775–79. On the outbreak of the first Mysore War in 1780 he was put at the head of a large body of troops, and defeated Brathwaite on the banks of the Coleroon in February 1782. He succeeded his father in December 1782, and in 1784 concluded peace with the British, and assumed the title of sultan. In 1787–88 he subjugated the Nairs of Malabar, and in 1789 provoked British invasion by ravaging the territories of the raja of Travancore. When the British entered Mysore in 1790, he retaliated by a counter-invasion, but was compelled by Cornwallis's victory near Seringapatam to cede half his dominions (March 16, 1792). The British having deemed it necessary to renew hostilities in March 1799, he was shut up in Seringapatam and finally killed during the storm (May 4, 1799). Tippoo was of cruel disposition, and inferior in military talents to his father.

See L. B. Bowring, *Haidar Ali and Tipu Sultan* ("Rulers of India series," 1893).

TIPSTAFF (Mid. Eng. *tipped staf*), a staff of office mounted with a tip or cap of metal, or with a crown, carried by a constable or sheriff's officer, the term being hence applied to such an officer. Tipstaffs are attached to the king's bench and chancery divisions of the High Court of Justice in England; their duty is to arrest or take into custody any person on an order of committal, if within the precincts of the court, and convey him to the king's prison at Holloway. The tipstaff for the common law courts was originally appointed by the marshal of the king's bench, and the tipstaff of the lord chancellor by the marshal of the Fleet prison. Since the abolition of these prisons the tipstaffs have been appointed by the lord chancellor and lord chief justice respectively.

TIPTON, an urban district of Staffordshire, England, in the parliamentary borough of Wednesbury, adjacent to Dudley (1½ m. S.), served by the London & North Western and Great Western railways. Pop. (1901), 30,543. Its streets are interspersed with coal-mines and iron works. Heavy iron goods are the principal products, anchors and cables being a speciality; there are numerous furnaces and rolling mills; also cement-works, brick-works and maltings. The village round which the modern town sprang up is mentioned in Domesday as Tibbington; its ancient church was undermined and collapsed in 1797.

TIRABOSCHI, GIROLAMO (1731–1794), the first historian of Italian literature, was born at Bergamo on the 18th of December 1731. He studied at the Jesuit college at Monza, entered the order, and was appointed in 1755 professor of eloquence in the university of Milan. Here he produced (1766–1768) *Vetera humiliatorum monumenta* (3 vols.), a history of the extinct order of the Humiliati, which made his literary reputation. Nominated in 1770 librarian to Francis III., duke of Modena, he turned to account the copious materials there accumulated for the composition of his *Storia della letteratura italiana*. This vast work, in which Italian literature from the time of the Etruscans to the end of the 17th century is traced in detail, occupied eleven years, 1771–1782, and the thirteen quarto volumes embodying it appeared successively at Modena during that period. A second enlarged edition (16 vols.) was issued from 1787 to 1794, and was succeeded by many others, besides abridgments in German, French and English. Tiraboschi died at Modena on the 3rd of June 1794, leaving a high reputation for virtue, learning and piety.

Tiraboschi wrote besides *Biblioteca modenese* (6 vols., 1781–1786); *Notizie de' pittori, scultori, incisori, ed architetti modenesi* (1786); *Memorie storiche modenesi* (5 vols., 1793–1794), and many minor works. He edited the *Nuovo giornale dei letterati d'Italia* (1773–1790), and left materials for a work of great research entitled *Dizionario topografico-storico degli stati estensi* (2 vols. 4to, Modena, 1824–1825).

TIRAH, a mountainous tract of country on the Peshawar border of the North-west Province of India. It lies between the Khyber Pass and the Khanki Valley, and is inhabited by the Afridi and Orakzai tribes. It is chiefly notable as the scene of the Tirah Campaign of 1897 (see below). It is a cul-de-sac in the mountains, lying off all the roads to India, and the difficulty of its passes and the fierceness of its inhabitants had hitherto preserved it inviolable from all invaders. Tirah comprises an area of some six to seven hundred square miles and includes under this general name all the valleys lying round the source of the Bara river. The five chief valleys are Maidan, Rajgul, Waran, Bara and Mastura.

Maidan, the summer home of the Afridis, lies close under the snow-bound ridges of the Safed Koh at an elevation of about 6400 ft. It is an oval plain about seven to eight miles long, and three or four wide, and slopes inwards towards the centre of its northern side, where all the drainage gathered from the four corners of the plain is shot into a narrow corkscrew outlet leading to the Bara Valley. Centuries of detritus accumulated in this basin have filled it up with rich alluvial soil and made it one of the most fertile valleys on the frontier. All its alluvial slopes are terraced and revetted and irrigated till every yard is made productive. Here and there dotted about in clusters all over the plain are square-built two storeyed mud and timber houses, standing in the shade of gigantic walnut and mulberry trees. Up on the hillsides surrounding the Maidan basin are wild olives in wide-grown clumps, almost amounting to forest, and occasional pomegranates. Higher still are the blue pines; but below on the shelving plains are nothing but fruit trees. Rajgul Valley lies north of Maidan, from which it is separated by a steep valley and well-wooded spur, eight to nine thousand feet high, and west of the Bara Valley, which it joins at Dwatoi. It is ten miles long, four to five miles at its widest, and has an elevation of 5000 ft. It is inhabited by the Kuki Khel Afridis. The Waran Valley is another valley about the same size as Maidan, lying east of it, and separated from it by the Tseri-Kandao Pass. It was the home of the Afridi mullah Sayad Akbar, and is the country of the Aka Khels. After the junction of the Rajgul and Maidan drainage at Dwatoi, the united stream receives the name of Bara, and the valley through which it flows down to its exit in the Peshawar Valley is also known by this name. The elevation of the valley is from 5000 ft. at Dwatoi to 2000 at Kajurai; on the north side it is hemmed in by the Surghar range, which divides it from the Bazar Valley; on the south lies another range dividing it from Maidan and the Waran Valley. The heat of the Bara Valley in summer is said to be excessive, malaria is prevalent, and mosquitoes very troublesome, so the hamlets are deserted and the Afridis migrate to the pleasant heights of Maidan. The Mastura Valley occupies the southern half of Tirah, and is inhabited by the Orakzais. It is one of the prettiest valleys on the frontier, lying at an elevation of 6000 ft. The Orakzais live, for the most part, in the Miranzai Valley, in the winter, and retreat to Mastura, like the Afridis, during the summer months. The chief passes in Tirah are the Sampagha Pass (6500 ft.), separating the Khanki Valley from the Mastura Valley; the Arhanga Pass (6995 ft.), separating Mastura Valley from Maidan; Saran Sar (8650 ft.), leading from the Zakka Khel portion of Maidan into the Bara Valley; the Tseri Kandao (8575 ft.), separating Maidan from the Waran Valley, and the Sapri Pass (5190 ft.), leading from the east of the Mastura Valley into the Bara Valley in the direction of Mamanai. The whole of Tirah was thoroughly explored and mapped at the time of the Tirah Expedition.

TIRAH CAMPAIGN, an Indian frontier war in 1897–98. The Afridis had for sixteen years received a subsidy from the Indian government for the safeguarding of the Khyber Pass, in addition to which the government had maintained for this purpose a local regiment entirely composed of Afridis, who were stationed in the pass. Suddenly, however, the tribesmen rose, captured all the posts in the Khyber held by their own countrymen, and attacked the forts on the Samana Ridge near Peshawar. It was estimated that the Afridis and Orakzais could, if united, bring from 40,000 to 50,000 men into the field. The preparations for the expedition occupied some time, and meanwhile the Mohmand rising north-west of the Khyber Pass was first dealt with (see MOHMAND).

The general commanding was General Sir William Lockhart (*q.v.*) commanding the Punjab Army Corps; he had under him 34,882 men, British and native, in addition to 20,000 followers. The frontier post of Kohat was selected as the base of the campaign, and it was decided to advance along a single line. On the 18th of October the operations commenced, fighting ensuing immediately. The Dargai heights, which commanded the line of advance, were captured without difficulty, but abandoned owing to the want of water. On the 20th the same positions were gallantly stormed, with a loss of 199 killed and wounded. The progress of the expedition, along a wretched track through the mountains, was obstinately contested on the 29th of October at the Sampagha Pass leading to the Mastura valley, and on the 31st at the Arhanga Pass from the Mastura to the Tirah valley. The force, in detached brigades, now proceeded to traverse the Tirah district in all directions, and to destroy the walled and fortified hamlets of the Afridis. The two divisions available for this duty numbered about 20,000 men. A force about 3200 strong commanded by Brigadier-General (afterwards Major-General Sir Richard) Westmacott was first employed to attack Saran Sar, which was easily carried, but during the retirement the troops were hard pressed by the enemy and the casualties numbered sixty-four. On the 11th of November Saran Sar was again attacked by the brigade of Brigadier-General (afterwards Sir Alfred) Gaselee. Experience enabled better dispositions to be made, and the casualties were only three. The traversing of the valley continued, and on the 13th of November Brigadier-General Kempster's brigade visited the Waran valley via the Tseri Kandao Pass. Little difficulty was experienced during the advance, and several villages were destroyed; but on the 16th, during the return march, the rearguard was hotly engaged all day, and had to be relieved by fresh troops next morning. The casualties numbered seventy-two. Almost daily the Afridis, too wise to risk general engagements, waged a perpetual guerrilla warfare, and the various bodies of troops engaged in foraging or survey duties were constantly attacked. On the 21st of November a brigade under Brigadier-General Westmacott was detached to visit the Rajgul valley. The road was exceedingly difficult and steady opposition was encountered. The objects were accomplished, and the casualties during the retirement alone numbered twenty-three. The last important work undertaken was the punishment of the Chamkannis, Mamuzais and Massozais. This was carried out by Brigadier-General Gaselee, who joined hands with the Kurram movable column ordered up for the purpose. The Mamuzais and Massozais submitted immediately, but the Chamkannis offered resistance on the 1st and 2nd of December, the British casualties numbering about thirty. The Kurram column then returned to its camp, and Sir W. Lockhart prepared to evacuate Tirah, despatching his two divisions by separate routes—the 1st under Major-General W. Penn Symons (d. 1899) to return via the Mastura valley, destroying the forts on the way, and to join at Bara, within easy march of Peshawar; the 2nd division under Major-General Yeatman Biggs (d. 1898), and, accompanied by Sir W. Lockhart, to move along the Bara valley. The base was thus to be transferred from Kohat to Peshawar. The return march began on the 9th of December. The cold was intense, 21 degrees of frost being registered before leaving Tirah. The movement of the 1st division though arduous was practically unopposed, but the 40 miles to be covered by the 2nd division were contested almost throughout. The actual march down the Bara valley (34 miles) commenced on the 10th, and involved four days of the hardest fighting and marching of the campaign. The road crossed and recrossed the icy stream, while snow, sleet and rain fell constantly. On the 10th the casualties numbered about twenty. On the 11th some fifty or sixty casualties were recorded among the troops, but many followers were killed or died of exposure, and quantities of stores were lost. On the 12th the column halted for rest. On the 13th the march was resumed in improved weather, though the cold was still severe. The rearguard was heavily engaged, and the casualties numbered about sixty. On the 14th, after further fighting, a junction with the Peshawar column was effected. The 1st division, aided by the Peshawar column, now took possession of the Khyber forts without opposition. Negotiations for peace were then begun with the Afridis, who under the threat of another expedition into Tirah in the spring at length agreed to pay the fines and to surrender the rifles demanded. The expeditionary force was broken up on the 4th of April 1898. A memorable feature of this campaign was the presence in the fighting line of the Imperial Service native troops under their own officers, while several of the best known of the Indian princes served on Sir W. Lockhart's staff. (C. J. B.)

TIRANA, a town of Albania, European Turkey, in the vilayet of Scutari; 20 m. E. by N. of Durazzo, at the southern extremity of the plain of Kroïa. Pop. (1905) about 12,000. Tirana is beautifully situated on the border of the richly wooded highlands inhabited by the Mirdite Albanians. It is a picturesque town with a large bazaar and many mosques, gardens and olive groves. It was founded early in the 17th century and was long the see of a Greek bishop, although the majority of its inhabitants have always been Moslems. Kroïa, the ancient stronghold of Scanderbeg (*q.v.*), is 14 m. north.

TIRARD, PIERRE EMANUEL (1827–1893), French politician, was born of French parents at Geneva on the 27th of September 1827, and, after studying in his native town, became a civil engineer. After five years of government service he resigned to become a jewel merchant. His determined opposition to the empire, culminating in 1869 in a campaign in favour of the radical candidate opposed to Ollivier, was rewarded by his election as mayor of the 11th arrondissement of Paris and as deputy for the Seine. Nominated a member of the Commune, he protested against the tyranny of the central committee, and escaped from Paris to resume his place among the extreme Left in the National Assembly at Versailles. In 1876 he was returned for the 1st arrondissement of Paris to the Chamber of Deputies, and was re-elected next year. He specially devoted himself to finance, being for a short time president of the customs commission before his appointment as minister of agriculture and commerce in March 1879 in the Waddington cabinet. He held the same portfolio in the first Freycinet ministry (1879–1880) and in the Jules Ferry cabinet (1880–1881). He was minister of commerce in Freycinet's second cabinet (1882), of finance under E. Duclerc (1882–1883), and under A. Fallières (1883), retaining the same office in the second Jules Ferry ministry (1883–1885). When Carnot became president of the Republic in 1887 he asked Tirard to form a ministry. He had to deal with the Wilson scandal which had led to President Grévy's downfall, and with the revisionist agitation of General Boulanger. His refusal to proceed to the revision of the constitution of 1875 led to his defeat on the 30th of March 1888. He returned to power next year, and decided to bring Boulanger and his chief supporters before the High Court, but the general's flight effectively settled the question. He also arrested Philip, duke of Orleans, who had visited France in disguise. He resigned office on the 15th of March 1890 on the question of the Franco-Turkish commercial treaty. He replaced M. Rouvier in the Ribot cabinet (1892–1893) as minister of finance, and died in Paris on the 4th of November 1893.

TIRE, an homonymous word, of which the meanings are (1) to weary out, (2) to adorn, or, as a substantive, a head-dress, (3) the outer rim of a wheel. "Tire" in sense (1) is from the Old English *teorian*, to weary, transitive and intransitive. Ultimately this word is connected with "tear," to rend, the stages of meaning being to rend apart, to wear out, to be or make exhausted.

In sense (2) the word is a shortened form of "attire," dress, equipment; this is from the Old French *atirer*, to put in order, *tire*, a row, hence the word now spelled in English *tier*, but earlier found as *tire* or *lyre*. "Tire" (3) is somewhat obscure etymologically. It may be connected with "attire," especially with reference to a similarity to the band of a woman's head-dress, or it may be a corruption of "tie-r," meaning that which "ties" or fastens together, though this is rejected by Skeat. The spelling "tyre" is not now accepted by the best English authorities, and is unrecognized in America.

The tire of a wheel is the outer circumferential portion that rolls on the ground or the track prepared for it. When the track is smooth and level, as in a railway, the principal functions of the tire are to provide a hard, durable surface for the wheel, and to reduce to a minimum the resistance to rolling. Railway vehicle wheels usually have hard steel tires, this combination with the hard steel rail giving the maximum endurance and the minimum rolling resistance. For road vehicles also, in which durability is the prime consideration, the tires are usually rings of iron or steel shrunk on the wooden wheels.

In bicycles, motor-cars, and other road vehicles in which freedom from vibration and shock from uneven road surface is desired, rubber or pneumatic tires are employed. These elastic tires are capable of absorbing small irregularities in the road surface without transmitting much vibration to the frame of the vehicle. Their range of yield is, however, too limited to absorb the larger irregularities met with on rough roads, so that their use does not obviate the necessity of spring support of the carriage body on the wheel axles. The pneumatic tire has a very much smaller rolling resistance than a solid rubber tire. Where the driving power is limited, as in bicycles, this consideration is by far the most important. A pneumatic tired bicycle requires less power to drive it at a given speed than does one with solid rubber tires—in popular language, it is much faster; hence pneumatic tires are now almost universally used on bicycles.

Rolling Resistance.—Professor Osborne Reynolds, in his investigations on the nature of rolling resistance, found that it is due to actual sliding of the surfaces in contact. Fig. 1 shows an iron roller resting on a flat, thick sheet of india-rubber. A series of equidistant parallel lines drawn on the india-rubber are distorted by the pressure, as shown in the figure. The distance between the marks on the periphery of the roller corresponds to that between the lines on the undistorted sheet of rubber. The motion of the roller being from left to right, actual contact takes place between C and D. The surface of the rubber is depressed at P, is bulged up in front at D, and behind at C. The vertical compression of the rubber at P causes it to bulge laterally, this causing a lateral contraction at D, which in turn causes a vertical extension at D. There is thus created a tendency to relative creeping motion between the roller and rubber. Between f and e there is no relative sliding, but over the portions eD and Cf there is slipping, with a consequent expenditure of energy. The action causes the actual distance traversed by the roller to be different from the geometric distance calculated from the diameter and number of revolutions of the roller. A certain amount of energy is expended in distorting the rubber between P and D; part of this energy is restored as the rear portion of the roller passes over this and the rubber gets back to its original unstrained state.

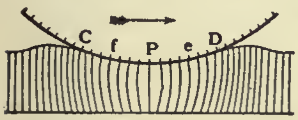


FIG. 1.

With a solid rubber tire rolling on a hard, smooth surface the action is similar. Fig. 2 shows a portion of the tire flattened out: p_1 and p_2 are the intensities of the pressures at points a_1 and a_2 at equal distances in front of and behind c, the geometrical point of contact: p_1 opposes, p_2 assists the rolling of the wheel. At usual speeds the opposing force, p_1, will be greater than the force of restitution, p_2, the difference being a measure of the elastic hysteresis of the material, H, at that speed. If the vertical compression cd of the tire be denoted by y, the energy lost may be said to be proportional to Hy. Comparing three tires of steel, solid rubber and air respectively rolling on a smooth, hard surface, H is probably smallest for steel and largest for rubber, y is least for steel, greater for a pneumatic tire pumped hard, greater still for solid rubber and for a pneumatic tire insufficiently inflated. The rolling resistance of the steel tire will therefore be least; next in order come the pneumatic tire inflated hard, and the pneumatic tire inflated soft, while the solid rubber tire has the greatest resistance.

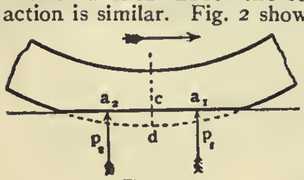

FIG. 2.

Pneumatic Tires. Weight Supported.—Let a pneumatic tire inflated to p lb per square inch support a load W lb. The portion

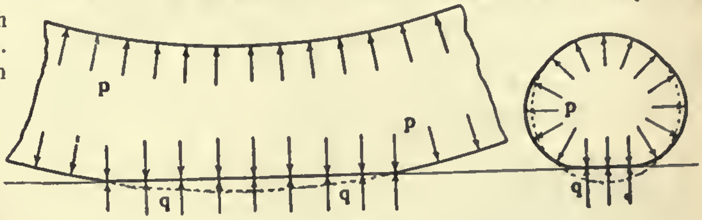

FIG. 3.

near the ground is flattened (fig. 3). If the tire fabric is assumed to be perfectly flexible, then, since the part in contact with the ground is quite flat, the pressure p and q on the opposite sides must be equal; that is, the tire presses on the ground with an intensity p lb per square inch. The area of the flattened portion

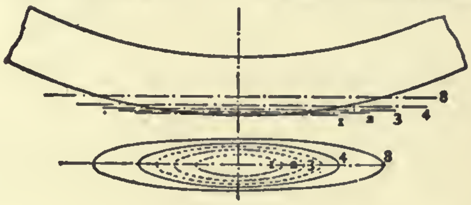

FIG. 4.

is therefore W/p. Fig. 4 shows the shapes of the areas of contact of a bicycle tire 28 in. by $1\frac{1}{2}$ in., for various amounts of vertical flattening, the figures annexed to the curves in plan and to the corresponding lines in elevation indicating the amount of vertical flattening in sixteenth parts of an inch. Let y be the vertical flattening, a the semi-major axis, and b the semi-minor axis of the curve of contact. For small values of y, corresponding to a tire pumped hard, the curves of contact may be considered plane sections of a circular ring. The area of the curve may be taken equal to that of an ellipse having the same axes, *i.e.* πab. But

$$a=\sqrt{R^2-(R-y)^2}=\sqrt{2Ry-y^2}=\sqrt{y}\,\sqrt{2R-y},$$

and

$$b=\sqrt{r^2-(r-y)^2}=\sqrt{y}\,\sqrt{2r-y},$$

R and r being the principal radii of section of the tire longitudinally and transversely. Therefore, approximately,

$$A=\pi ab=\pi y\sqrt{2R-y}\sqrt{2r-y}.$$

For small values of y, y may be neglected in comparison with $2R$ and $2r$ respectively, and the above equation becomes

$$A=2\pi y\sqrt{Rr}=\pi y\sqrt{Dd},$$

and therefore

$$W=2\pi yp\sqrt{Rr}=\pi yp\sqrt{Dd}.$$

For larger values of y, A is smaller than that given by the above formula, as shown in fig. 5, which gives the areas of contact plotted with respect to the vertical flattenings for a tire 28 in. by $1\frac{1}{2}$ in. The same curve may serve to show values of W, thus corresponding to the load-deflection curve of a spring. The curve clearly shows the small value of the pneumatic tire as a spring device. Thus, when pumped hard, so that the normal load is carried with $\frac{1}{4}$ in. vertical flattening, when the bicycle is travelling quickly, a lump on the road equivalent to $\frac{3}{8}$ in. further flattening nearly doubles the upward reaction on the wheel. With the normal load carried with $\frac{5}{8}$ in. vertical flattening the same lump on the road increases the upward reaction by only 23%, the area of contact of the tire being increased from 6·5 to 8 sq. in. The above brief investigation, involving a few approximations, is yet sufficiently accurate to afford a clear idea of the usual conditions of a tire.

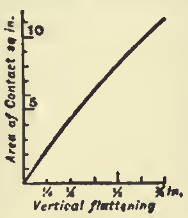

FIG. 5.

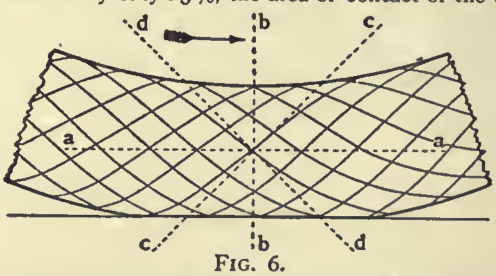

FIG. 6.

Outer Cover.—The outer cover has to be strong enough to withstand the air-pressure inside the tire and to transmit the driving or the braking effort from the wheel to the road surface. For the latter purpose, the threads of the fabric are best disposed spirally, as shown in fig. 6. While driving in the direction of the arrow the tension on the fibres *cc* will be slightly increased, that on fibres *dd* decreased. The distortion of the fabric due to driving is thus reduced to a minimum. A woven fabric is sometimes used, but one made up of two or more layers of parallel threads embedded in rubber is better. This construction makes the outer cover more flexible, and consequently less energy is wasted in distorting the fabric as the tire rolls on and off the ground, while greater durability is also secured. Fig. 7 shows a plain woven fabric, from which it is seen that each thread takes the form of a sinuous line. As the air-pressure inside the tire is increased the threads tend to become straighter, thus pressing together with a cutting action. The total thickness is greater than that of two layers of parallel threads, while on the latter the threads can be placed closer together. The woven fabric is therefore stiffer, weaker and less durable than that built up of parallel layers. The average tensile stress per inch width, t_1, on the longitudinal section of the cover is given by the formula $pd=2t_1$; that on the transverse section, t_2, by $pd=4t_2$, d being the diameter of the tire in transverse section; consequently the stress on the longitudinal section is twice that on the transverse. With the spiral disposition of the threads, as shown in fig. 6, this inequality of stress in the two principal directions has the effect of tending to enlarge the transverse section of the tire, while at the same time tending to contract the tire on the rim.

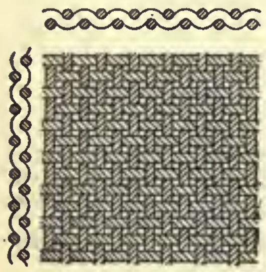

FIG. 7.

Single tube, Double tube and Tubeless Tires.—A tire, beside being strong enough to resist the stresses to which it is subjected, must be air-tight. In most tires for cycles and motor-cars an inner tube of india-rubber is made separate from the outer cover. In these double-tube tires the outer cover is more or less easily detachable from the rim. The air under pressure is pumped inside the inner tube, which is supported by the outer cover. In case of puncture of a bicycle tire, the inner tube is repaired by cementing a patch of rubber on the outside of the inner tube, a solution of india-rubber in naphtha or bisulphide of carbon being the cementing agent employed. Motor-car tires are best repaired by vulcanizing, as solution patches usually come loose owing to the heating of the tire. In a single-tube tire, as its name indicates, the outer cover and the air-tight tube are vulcanized together to form a single hollow ring. To repair a simple puncture of a single-tube tire it is not necessary to detach it from the rim. Single-tube tires are not often used now, except for path-racing bicycles. A tubeless tire, such as the "Fleuss" (fig. 8), consists of the outer cover, as used in a double-tube tire, to the inner surface of which an air-tight layer of sheet-rubber has been cemented. A continuous flap projects from one edge of the tire, and when in position on the rim this flap is pressed against the other edge, forming an air-tight seal. A slight moistening of the flap with soft soap tends to remove any imperfection in the tightness of the air seal. The repair of a puncture of a tubeless tire can be very quickly done. Since the inner surface of the air-tight layer is accessible, after placing the patch in position the tire can be inflated and the bicycle ridden at once; whereas in the double-tube tire sufficient time must elapse between the patching and the inflation to allow the rubber solution to set.

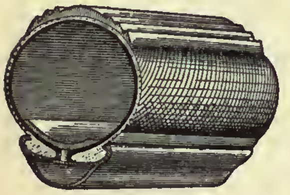

FIG. 8.

Attachment of Tires to Rims.—A single-tube tire can be cemented directly to the rim. For detachable double-tube tires on bicycles, two methods, the Dunlop-Welch endless wire (fig. 9) and the "beaded edge" (fig. 11), account for by far the greater proportion. In the Dunlop-Welch tire the endless wires are embedded in the two edges of the outer cover respectively, the transverse tension of the fabric being transmitted to them. Each endless wire is formed of three coils, so as to give flexibility to the edge of the cover. The ring formed by each endless wire is smaller in diameter than the edge of the rim. The middle portion of the rim is deepened, its diameter being less than that of the ring of endless wire. To detach the tire after deflation, one part of the edge of the outer cover is depressed into the bottom of the rim, the opposite part then projects slightly beyond the edge of the rim and is pulled outside; one portion being got outside, the rest easily follows. Fig. 10 shows the nature of the mutual action between outer cover C, rim R, and endless wire W in a Dunlop-Welch tire. The transverse tension T on the outer cover is transmitted to the endless wire W, which is also subjected to the reaction N of the rim. The resultant Q must lie in the plane of the endless wire W, and constitutes a radially outward force acting at all points, which in turn causes a longitudinal pull, P, on the wire. Let d be the diameter of the inner air-tube, D the diameter of the ring formed by the endless wire W, p the air pressure, and θ the angle

FIG. 9.

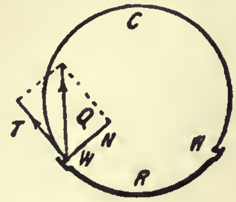

FIG. 10.

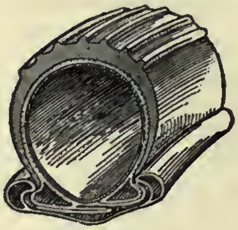

FIG. 11.

between T and Q. Then for each inch length of wire $T=pd/2$, $Q=T/\cos\theta$; while $P=QD/2$. Combining these results, we get $P=pdD/4\cos\theta$. If $\theta=30°$, $P=0{\cdot}29pdD$, from which the section of wire for a tire of any size can be calculated.

In the "beaded edge" fastening, thickened edges on the outer cover take into corresponding edges formed on the rim, and are securely held therein when the tire is inflated.

Prevention of Punctures.—The outside of the tire is covered with a thick layer of rubber, which protects the fabric from injury by contact with the rough road surfaces. In full roadster tires this outer layer of rubber is thinner at the sides than at the tread (the part which actually rolls on the ground), but still completely covers the fabric. In light roadster and racing tires the sides are not covered, and an appreciable gain in speed or ease of driving is due to the greater flexibility of the cover thus obtained. Numerous puncture-proof bands and other devices have been tried with the object of absolutely preventing punctures, or making the tire self-sealing after puncture; but they increase the rolling resistance, and therefore the effort necessary to drive the bicycle at a given speed.

Valve for Pneumatic Tire.—A non-return valve is permanently attached to the inner tube of the tire, which allows the air forced from the inflater to pass inside the inner tube. The most commonly used, the Dunlop-Woods valve, consists of a short piece of rubber tubing mounted on a brass stem, which has a small hole communicating from its outer end to the inner surface of the rubber tube. Normally, the tubing closes the mouth of this hole, preventing the air from escaping from the tire, but lifts freely when air is being forced from the inflater. The arrangement of the parts for deflating and for getting access to the rubber tubing is very simple and effective. The cyclist should be careful that the small piece of valve tubing, and the two fibre washers at the ends of the flexible connecter which serve to make air-tight the two joints between the latter and the pump and valve stem respectively, are always in good condition. If either of these seemingly small details is out of order it may be impossible to pump the tires hard enough; the bicycle being ridden, the tires may be nipped in many places between the rim and sharp edges on the road surface, and practically ruined.

Tires for Motor Cars.—In the cost of upkeep of a motor car the tires are the most expensive item. For a slow speed vehicle an ordinary steel tire, shrunk or hydraulically pressed on a wooden wheel, is cheap and durable. At higher speeds over uneven roads it is less satisfactory; the wheel, forming with the tire one rigid body, receives violent accelerations vertically, due to the uneven road, and is being continually shot upwards into the air out of contact with the ground. Thus excessive noise and vibration are caused at all but very moderate speeds, and for passenger cars an elastic tire is a necessity. The solid rubber tire, not being liable to puncture, is trustworthy if made of sufficient sectional area, but it is expensive and lacks the comfort and easy running of the pneumatic. The motor car pneumatic tire is made on the same lines as the cycle tire, but the air-tube is thicker, and the outer cover is built up with several layers of canvas or fabric to give the necessary strength (fig. 14). To provide for wear, the outer protective layer of rubber is considerably thickened at the tread, where it is also reinforced with two or three layers of canvas. The Palmer cord tire is built up of two layers of cord (fig. 12) arranged spirally, each cord being composed of four strands of six threads. The cords are flattened

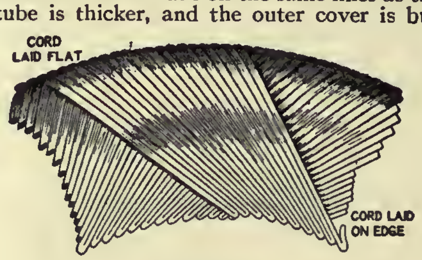

FIG. 12.

somewhat, their narrow surfaces being together at the tread of the tire, and their wide ones at the beaded edge. The anchorage of the cord to the beaded edge is obtained by steel pins passing through the loops of the cord and into the canvas beads (fig. 13). The cords, tread and beads being all vulcanized together, the tire is practically impervious to moisture, and has therefore less tendency to rot than a canvas tire. Further, the threads, by the process of manufacture, are insulated each from the others by a layer of rubber, and there is thus less tendency for them to fray or saw each other as the tire yields during continuous running. These features of construction tend to greater durability.

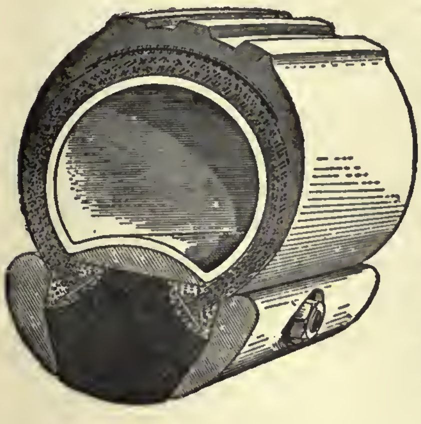

FIG. 13.

Strains on Fabric of Pneumatic Tire.—As each portion of the tread comes in contact with the ground it is flattened, while the rest of the transverse section has its radius of curvature slightly decreased (fig. 3). Thus the transverse section is repeatedly undergoing flexure through a range extending from flatness (radius of curvature infinity) to a radius of curvature slightly less than that of the normal section. On the longitudinal section the range of flexure is from flat to a radius of curvature equal to that of the normal section. The latter range is therefore much less than the former. The necessary thickness of the fabric and rubber to resist the air pressure and punctures involves a certain amount of stiffness; consequently the energy expended in the flexure of the tire is much greater than in a thin cycle tire. This energy appears as heat; the temperature of the cover rises until the heat carried away by the air is equal to that generated by flexure. At very high speeds this heating becomes so great as to have an injurious action on the rubber and fabric. Unfortunately, the solid rubber tire is worse off in this respect, its elastic hysteresis, and therefore the heating effect, being greater than that of a pneumatic tire. It is evident that increase of the diameter of the tire-section lessens the heating action, while reduction of diameter of the wheel has no effect, so long as the range of longitudinal flexure is less than the transverse. Nearly all tire fabrics are equally stiff longitudinally and transversely; but probably greater durability would be obtained from a fabric more flexible transversely, even if somewhat stiffer longitudinally.

Pneumatic Tires for Heavy Loads.—From the formula for load supported, $W=\pi y p\sqrt{Dd}$, for a given air pressure p and vertical flattening y, the load supported is proportional to the square root of the product of the longitudinal and transverse diameters; thus a tire 36″×4″ is equivalent to one 24″×6″. But the latter can be subjected to a much greater vertical flattening y than the former, with a less range of flexure of the cover, probably twice the amount. In this event, with the same air pressures, the 24″×6″ tire could carry a load twice that of the 36″ ×4″ tire. Or, if both tires carried the same load, the air pressure in the former might be half that in the latter, and, its vertical flattening under normal load being twice as great, its value as a spring in absorbing vertical unevenness of the road would be double. Since the first use of pneumatic tires for motor cars, they have been steadily reduced in diameter, and probably they can be made still smaller with advantage, if the transverse section be proportionately increased.

The following table gives the maximum loads and minimum air pressures for a few sizes of tires, as recommended by the Dunlop Pneumatic Tire Company. The corresponding vertical flattening has been calculated from the formula given above.

	Diameter.	Section.	Maximum Load per Wheel.	Minimum Air Pressure.	Vertical Flattening.
	In.	In.	lb	lb per sq. in.	In.
Light Car Tires	28	2½	360	70	·19
	28	3	400	75	·19
	28	3½	700	80	·25
Heavy Car Tires	32	3½	900	80	·33
	32	4	1000	85	·33
	32	5	1300	95	·34

Fastenings of Motor Tires to Rims.—The "beaded edge" type of fastening is most largely used, supplemented by security bolts (fig. 14). Fig. 13 shows a flange fastening as used for the Palmer cord tire, the two flanges being secured by a number of bolts passing through the rim of the wheel.

Solid Rubber Tires for Heavy Vehicles.—Fig. 15 shows a section of a solid rubber tire and rim, the rubber being forced under pressure on the beaded rim. For very heavy loads, as in motor omnibuses, a twin tire gives the best results. The two tires are fastened on the same rim, at a sufficient distance apart to allow each to bulge laterally as it rolls on the ground.

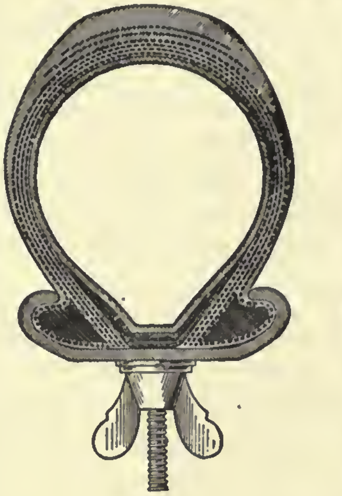

FIG. 14.

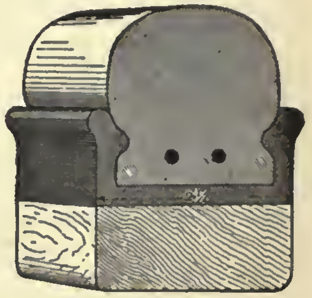

FIG. 15.

Non-Skid Devices.—As a pneumatic tire flattens where it is in contact with the road, under certain conditions of road surface a semi-liquid film of mud gets interposed, and frictional contact is reduced to a minimum. The vehicle has then no lateral constraint, and side-slipping or skidding may occur. On a bicycle this means a dismount, probably a severe fall; on a three or four-wheeled vehicle the steering control is temporarily lost. Cycle tires are usually provided with longitudinal ridges at the tread (figs. 8, 9, 11); the narrow surfaces of the ridges penetrate the mud and get a better grip on the solid road surface. Motor car tires are sometimes left with a smooth tread (fig. 14); fig. 13 shows a non-slipping tread with longitudinal ridges. The Dunlop non-slipping tread is formed by a series of lateral grooves about 2 in. apart all round the tread. Fig. 16 shows a tire fitted with a non-skid leather band, to which hard steel studs are fastened. This type of non-skid band can be either vulcanized to the tire or independently fastened to the rim at the beaded edges. The Parsons "non-skid" device consists of chains crossing the tire at right angles and fitting loosely over its surface; they are fastened at intervals to two chain rings one on each side of the wheel, and can be easily adapted to any tire. (A. Sp.)

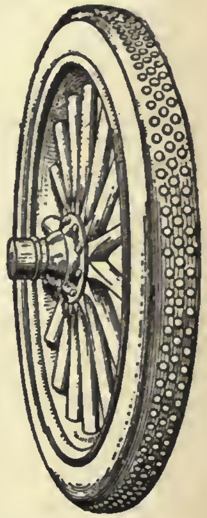

FIG. 16.

TIREH (anc. *Teira*), a town of Asia Minor, situated in the valley of the Küchük Menderes (*Caystrus*) at the foot of Mt Messogis. It was the capital of the amirate of Aidin in the 14th century, and is described by Ibn Batuta as a fine city with streams and gardens. Pop. over 14,000, the larger half Moslems. It is connected with Smyrna by a branch of the Aidin railway, and has a trade in raisins, wheat, rice, tobacco and cotton.

TÎRGOVISHTEA (Rumanian *Tîrgoviştea*, or *Târgovişlea*, sometimes incorrectly written *Tergovista* or *Tirgovist*), the capital of the department of Dimbovitza, Rumania; situated at the foot of the Carpathians, on the right bank of the river Jalomitza, 48 m. N.N.W. of Bucharest. Pop. (1900), 9398. A branch line connects Tîrgovishtea with the main Walachian system, and is prolonged northwards into the hills, where there are rich deposits of petroleum, salt and lignite. Coal is also found but not worked. Apart from the scanty ruins of a 14th-century palace, the most interesting building in the town is the Metropolitan church, still one of the finest in the country, with its nine towers and monuments of the princely house of Cantacuzino. It was founded in 1515 by Neagoe Basarab, builder of the famous cathedral of Curtea de Argesh. Tîrgovishtea is a garrison town, with a cavalry training school and an artillery depot and repairing arsenal.

Under Mircea the Old (1383–1419) Tîrgovishtea became the third capital of Walachia. In the 15th century it was sacked by the Szeklers. Michael the Brave defeated the Turks under its walls in 1597. In the 16th century it had a population of 60,000 and contained 70 churches and 40 convents. After Constantine Brancovan moved the seat of government to Bucharest in 1698, Tîrgovishtea lost its importance and the population decreased.

TÎRGU JIU (often incorrectly written Tergu Jiu), the capital of the department of Gorjiu, Rumania; situated among the lower slopes of the Carpathians, on the left bank of the river Jiu, and at the terminus of a branch railway which joins the main Walachian line between Turnu Severin and Craiova. Pop. (1900), 6634. The town has a small trade in timber, petroleum and farm produce. Anthracite coal is found in the neighbourhood.

TÎRGU OCNA (Rumanian also *Targul Ocna*), a town of Rumania, on the left bank of the river Trotosh, an affluent of the Sereth, and on a branch railway which crosses the Ghimesh Pass into Transylvania. Pop. (1900), 8033. Tîrgu Ocna is built among the Carpathian Mountains, on bare hills formed of rock salt. Outside the town stands the largest prison in Rumania; beyond this are the mines, worked, since 1870, by convicts, who receive a small wage. The thickness of the salt is unknown; the mines yield about 11,000 tons annually.

TIRHUT, or Tirhoot, the historic name of a tract in northern India, being that portion of Behar which lies north of the Ganges. It corresponds roughly with the ancient Hindu kingdom of Mithila (*q.v.*). Down to 1873 it formed a single district, which was then divided into the two districts of Darbhanga and Muzaffarpur. In 1908, when the division of Patna was subdivided, the name of Tirhut was again officially given to a new division, containing the four districts of Darbhanga, Muzaffarpur, Saran and Champaran: total area, 12,588 sq. m.; total pop. (1901), 9,867,373. It is a continuous alluvial plain, traversed by many winding rivers, and it supports the densest population in all India. It is the main centre of the indigo industry, conducted by European planters, which is now in a declining condition. Other crops are rice, millets, wheat, maize, oilseeds, sugar-cane and tobacco. Apart from indigo there are no large industries. Since the famine of 1874 the whole country has been saved from its former isolation by the construction of the Bengal & North-Western railway, with numerous branches; but the Ganges is nowhere bridged.

TIRIDATES, or Teridates, a Persian name, given by Arrian in his *Parthica* (preserved by Photius, *cod.* 58, and Syncellus, p. 539 seq.) to the brother of Arsaces I., the founder of the Parthian kingdom, whom he is said to have succeeded. But Arrian's account seems to be quite unhistorical (cf. Parthia).

The king commonly called Tiridates II. was set up by the Parthians against Phraates IV. in 32 B.C., but expelled when Phraates returned with the help of the Scythians (Dio Cass. li. 18; Justin xlii. 5 seq.; cf. Horace, *Od.* i. 26). Tiridates fled to Syria, where Augustus allowed him to stay, but refused to support him. During the next years Tiridates invaded Parthia again; some coins dated from March and May, 26 B.C., with the name of a king "Arsaces Philoromaios," belong to him; on the reverse they show the king seated on the throne, with Tyche stretching out a palm branch towards him. He was soon expelled again, and brought a son of Phraates into Spain to Augustus. Augustus gave the boy back to his father, but declined to surrender "the fugitive slave Tiridates" (Justin xlii. 5; Dio liii. 33; cf. *Mon. Ancyr.* 5, 54; in li. 18 Dio has wrongly placed the surrender of the son in 30 B.C.).

Tiridates III., grandson of Phraates IV., lived as a hostage in Rome and was educated there. When the Parthians rebelled against Artabanus II. in A.D. 35 they applied for a king to Tiberius, who sent Tiridates. With the assistance of L. Vitellius Tiridates entered Seleucia, but could not maintain himself long (Tacitus, *Ann.* vi. 32 sqq.; Dio Cass. lviii. 26).

The name Tiridates is also borne by some local kings of Persis, and by some Arsacid kings of Armenia and Georgia. The best known of the Armenian kings is the Tiridates (A.D. 238–314) who was baptized by Gregory the Illuminator (see Armenian Church). (Ed. M.)

TIRLEMONT (Flemish *Thienen*), a town of Belgium in the province of Brabant, 11 m. S.E. of Louvain. Pop. (1904), 18,340. It still preserves its enceinte, 6 m. in circumference. The principal church, Notre Dame du Lac, begun in the 12th and enlarged in the 15th centuries, is still unfinished. The church of St Germain also dates from the 12th century, and contains a fine altar-piece by Wappers. John Bolland, the Jesuit who began the collection of the *Acta sanctorum*, was born here in 1596. The principal industries are brewing, soap manufacture and tanning.

TIRMIDHĪ [Abū 'Isā Mahommed ibn 'Isā ut-Tirmidhī] (d. 892), Arabian traditionalist, was born at Tirmidh on the Jiḥūn. He was a scholar of the traditionalist Bukhārī, and in his search for traditions travelled through Khorasan, Irak and Hejaz. His *al-Jāmi' us-Ṣaḥīḥ* is one of the six canonical collections of traditions. In it he admitted every tradition that had ever been used to support a legal decision, indicating the doctrine it supported and mentioning the doctrines opposed to it. It was published at Bulaq in 1875. He also wrote the *Kitāb ush-Shama'il* on the character and life of Mahomet (printed at Calcutta, 1846). (G. W. T.)

TIROL (or Tyrol[1]), the most southerly province of the Austrian Empire. It makes a great bend southwards towards Italy, by which it is bounded on the S.E., S. and S.W., while on the W. it adjoins part of present Switzerland (till 1652 the Lower Engadine was Tirolese, and not Swiss) and also the Austrian province of Voralberg; to the N. it borders on Bavaria and to the E. the province of Upper Austria. It is traversed from west to east by the main chain of the Alps, which rises in various snow-covered summits, the more important being the Ortler (12,802 ft., the loftiest peak in Tirol and in the Eastern Alps generally), the Wildspitze (12,382 ft., Oetzthal group), the Zuckerhütl (11,520 ft., Stubai group), the Hochfeiler (11,559 ft., Zillerthal group), the Gross Venediger (12,008 ft.) and the Gross Glockner (12,461 ft., both in the Tauern range), while more to the south are the Dolomites, which culminate in the Marmolata (10,972 ft.). It is divided into two very distinct portions by the Brenner Pass (4495 ft.), connecting the Stubai and the Zillerthal groups; over this pass a splendid railway was built in 1864–1867 from Innsbruck to Verona, while the highway over the pass has from the earliest times been of immense importance from every point of view. The Brenner, too, being on the main watershed of the Alps, separates the two main river systems of which Tirol is composed. To the north this province comprises the middle portion of the Inn Valley, with its tributaries, as well as the upper portion of the Lech valley, all flowing towards the Danube and so to the Black Sea, while south of the pass is the great upper valley of the Adige or Etsch, with many tributaries, as well as (since 1500) a portion of the upper Drave valley, which physically belongs to Carinthia—all these (save the Drave) flow to the Adriatic Sea. The area of Tirol is 10,204 sq. m. In 1900 its population was 852,712 (all but wholly Romanist), of whom more than half were German-speaking, and many in the south Italian-speaking, while in certain side valleys of the Adige system the quaint old Ladin dialect, still surviving also in the Swiss Engadine, is the prevailing tongue; in the southern half of the region there are a few German-speaking among the Italian-speaking folk. The capital is Innsbruck, while other important towns are Trent, Botzen and Rovereto.

The present very irregular shape of the district is due to historical causes. The original Tirol consisted of part of the middle Inn valley and of the uppermost portion (the Vintschgau) of the Adige valley. In 1500, by inheritance from the counts of Görz, the Pusterthal and upper Drave valley (east) were added; in 1505 the lower portion of the Zillerthal, with the Inn

[1] To speak, as is commonly done, of "the Tirol" is as absurd as speaking of "the England." As regards the English spelling of the name adopted throughout the *Ency. Brit.*, it should, however, be stated that the writer of this article regards "Tyrol" as more correct.—(Ed.)

valley from its entrance to Kufstein, and the Kitzbühel region (north-east) were all won from Bavaria; in 1517 Rovereto and several other places on the present south-eastern frontier were acquired from Venice; in 1803 many fiefs in the bishoprics of Trent and Brixen were annexed on the secularization of those two bishoprics; while finally the rest of the Zillerthal, with Windisch Matrei, was obtained in 1816 from the archbishopric of Salzburg. Besides the great railway line over the Brenner, there are other lines from Botzen past Meran to Mals, from Franzensfeste up the Pusterthal to Lienz in the Drave valley, and from Innsbruck, by a tunnel beneath the Arlberg Pass to the Vorarlberg and the Rhine valley.

The majority of the population is devoted to pastoral, and in some degree to agricultural pursuits, the cattle, as in other Alpine lands, being the mainstay of the peasants. In summer they are driven up to the mountain pastures (called here *Almen*, but *Alpen* in Switzerland), which are, however, less carefully looked after than in Switzerland, partly because in many cases they have been alienated by the neighbouring hamlets to far distant places. Forestry also employs a certain proportion of the population, but the felling of trees is carried on wastefully, though less so than in former years. A few minerals are found in the district, but in this department the saltworks of Hall, near Innsbruck, take the first place. In southern Tirol, silk-spinning is still one of the principal industries, while good local wines are produced near Meran and Botzen. There are also some factories of preserved fruits and tobacco. But, save in the towns, Tirol is above all a pastoral land.

The peasants are famous for their devotion to the Roman Catholic religion, their fervent loyalty to the House of Austria, their excellent marksmanship, and their love of singing and music, the zither being the national instrument. There is a university at Innsbruck, but primary education, though compulsory, does not attain any very high degree of excellence, as in summer the schools are closed, for all hands are then required in the fields or on the mountain pastures. The picturesque local costumes have nearly altogether disappeared, save in the Passeyerthal, near Meran, while the increasing crowds of summer visitors have largely spoilt the simplicity of the natives. Ecclesiastically, Tirol is ruled by the archbishop of Salzburg and his two suffragans, the bishops of Trent and of Brixen. The country is divided into 21 administrative districts (*Bezirke*), each composed of a number of *communes* or civil parishes. Tirol sends 25 representatives to the Austrian parliament at Vienna. Locally it is ruled by an Imperial governor (the *Statthalter*) who resides at Innsbruck, where, too, meets annually the local legislature or Diet (the *Landtag*), composed (according to the constitution of 1861) of 68 members; the archbishop of Salzburg, the bishops of Trent and Brixen, and the rector of the university of Innsbruck sit in person, while the great ecclesiastical corporations send four deputies, the chambers of commerce of Innsbruck, Trent and Rovereto each one, the nobles ten, the towns 13, and the peasants 34.

History.—By far the greater portion of the region later called Tirol was inhabited, when it makes its appearance in history, by the Raetians (perhaps a Celtic race, though some still hold that they were connected with the Etruscans), who were conquered (14 B.C.) by Drusus and Tiberius, and were later organized into the Roman province of Raetia. In the 5th and following centuries the north portion was Teutonized, first by the Ostrogoths, mainly by the Baiouarii, but the Teutonic Langobardi who pressed up from the south became Romanized themselves, so that the double character of the inhabitants of the land appears quite early. In 774 the Carolingians conquered the Langobardi or Lombards, and in 788 the Baiouarii. But the officials charged with the rule of these parts gradually became semi-independent, particularly the Bavarian dukes in the region north of Trent. Some time after the break-up of that duchy in 976, the emperor Conrad II. entrusted all temporal powers in the northern region to the bishop of Brixen, and in the southern portion to the bishop of Trent, detaching these southern districts from Italy (to which they had always belonged, save from 951 to 962, when the march of Verona was annexed to the duchy of Carinthia) and incorporating them with Germany. The bishops, in their turn, had to exercise their temporal rights through lay vassals, of whom the most powerful in the course of the 12th century were the lords of Andechs, near Munich. On the extinction of this family in 1248, most of their fiefs were given by the two bishops to the father-in-law of the last lord of Andechs, Albert, count of Tirol. This new family took its name from the still existing castle of Tirol (Later Roman, *Teriolis*), above Meran, in the upper Adige valley, and is mentioned for the first time in 1140. Albert's elder daughter, Adelaide, married Meinhard, count of Görz (north of Trieste); their elder son Meinhard (d. 1295) took Tirol, and the younger Görz; but in 1500 the latter's line became extinct, and the elder line inherited its possessions. Long before that time the senior branch of the elder line had ended in Margaret, nicknamed *die Maultasche* (the Pocket-mouth), who, in 1342, married Louis of Brandenburg (d. 1361), and whose only child Meinhard died in her lifetime in 1363; Tirol accordingly passed by agreement in the latter year of the junior branch of the elder line, the Habsburgers, dukes of Austria since 1282. In this way Tirol came to the dynasty which has ever since held it (save 1805–1814). From that time onwards till 1665 Tirol was generally entrusted to a cadet of the Austrian house, who ruled first at Meran, and from about 1420 at Innsbruck, as a nearly independent prince; but since 1665 the province has been governed from Vienna. We have noted above the manner in which the limits of Tirol were gradually extended. Several of these additions were due to the archduke Maximilian, who ruled Tirol from 1490 onwards, becoming emperor in 1493 and dying in 1519. His memory is still cherished in the district, for he conferred on it the title of *Gefürslele Grafschaft*, spent much time in it, and erected in the chief church of Innsbruck a sumptuous monument as his tomb.

Owing to its position astride of the Alps, and so commanding the road across them, Tirol has often been the scene of sharp fighting. In 1499 the Swiss won a victory in the Calven gorge (near the head of the Adige valley) against Maximilian, which resulted in the Swiss gaining their practical independence of the empire. In 1703 the Bavarians and French, during the War of the Spanish Succession, took Innsbruck, but were then driven back. In 1805, by the peace of Pressburg, Napoleon forced Austria to hand over Tirol to his ally, Bavaria, which held it till 1814. On the outbreak of war (1809) between France and Bavaria, the people rose in revolt. Their leader was Andreas Hofer (b. 1767), a small innkeeper of the Passeyerthal, and under him the peasants repeatedly defeated the Bavarian, French and Saxon troops. Three times (April 13, May 29 and Aug. 13) did they drive the foe out of Innsbruck. On the 15th of August, Hofer, yielding to the popular wish, assumed the government of Tirol. But in October the ill-success of the Austrians against the French elsewhere forced them to conclude the peace of Vienna, by which Tirol was definitely secured to Bavaria. The peasants refused to believe in the bad news, and continued to resist the French, but were at last overpowered by numbers. The French occupied the Passeyerthal on the 23rd of November, and Hofer was obliged to seek shelter in a hut on the mountain pastures. Here he was betrayed by a neighbour to the French (Jan. 27, 1810), who took him captive to Mantua, where, by express order of Napoleon, he was shot (Feb. 20, 1810) for the sole offence of being loyal to his emperor and his native land. His bones now lie in the great church at Innsbruck, side by side with those of his two chief supporters, the Capuchin friar and army chaplain, Joachim Haspinger (d. 1858), and the peasant, Joseph Speckbacher.

TIRSO DE MOLINA, the pseudonym of Gabriel Tellez (1571–1648), Spanish dramatist. Born at Madrid in October 1571, he studied at the Alcalá de Henares, joined the Order of Mercy on the 4th of November 1600, and made his religious profession in the Monastery of San Antolín at Guadalajara on the 21st of January 1601. He was a dramatist of ten years' standing when he was sent by his superiors on a mission to the West Indies in 1615; returning to Europe in 1617, he resided at the Mercenarian monastery in Madrid, took part in the proceedings of the *Academia poëtica de Madrid*, founded by Sebastián Francisco de Medrano, competed in the literary tournaments then in vogue, and wrote copiously for the stage. His first publication, the incomplete *Cigarrales de Toledo* (licensed in 1621, but apparently not published till 1624), is a miscellany, containing short tales, novels, verses and three plays; one of the novels, *Los Tres maridos burlados*, probably derived from Il Cieco da Ferrara's *Mambriano*, and the play entitled *El Vergonzoso en palacio* are admirable examples of witty contrivance. The preface to the *Cigarrales de Toledo* (the second part of which was never printed) states that Tirso de Molina had already written three hundred plays, and at this period of his career he was second only to his friend Lope de Vega in popularity. He avowed himself hostile to *culteranismo* in the *Cigarrales de Toledo*, and made numerous enemies by his attacks on the new school in such pieces as *Amar por arte mayor* and *La Celosa de sí misma*. The realistic character of some of his productions provided his unsuccessful rivals with an excuse for denouncing him as a corrupter of public morals to the council of Castile in 1625, and, though no legal action was taken against him, he appears to have been reprimanded privately. In 1626 it was deemed advisable to transfer him to Salamanca, and Tirso de Molina left Madrid determined to write no more for the stage. Though one of his plays, *La Huerta de San Juan*, is dated 1626, there is no proof that it was begun after his departure from Madrid, and he seems to have kept to his resolution for eight years. But he had not lost his interest in the theatre, and felt justified in publishing twelve representative pieces as the first part of his dramatic works (1626). This may be taken as a formal protest against the weakness of those who had sacrificed him to hypocritical clamour. In other respects he was submissive, and worked zealously on behalf of his order in which he rose to important positions; he became superior of the monastery at Trujillo in 1626, was elected later to the posts of reader in theology and *definidor general*, and in May 1632 was appointed chronicler of the Order of Mercy. His *Deleitar aprovechado* (1635) is a devout counterpart of the *Cigarrales de Toledo*, much inferior to its predecessor in interest; a sequel was promised to this collection of pious tales, pious lyrics, and *autos*, but, as in the case of the *Cigarrales de Toledo*, the continuation never appeared. Twelve plays constitute the third part of his dramatic works which was published (before the second) in 1634 under the nominal editorship of the writer's nephew Francisco Lucas de Ávila, but the existence of this nephew is doubtful. The second part (1635), the printing of which was paid for by the confraternity of St Jerome, contains four plays by Tirso de Molina, and eight written by him in collaboration with other dramatists; one of these collaborators was Ruiz de Alarcon (*q.v.*), but the internal evidence goes to show that Tirso de Molina was the predominant spirit in these literary partnerships. The fourth part of Tirso's dramatic works (1635) and the fifth (1636) each contain twelve plays; the haste with which these five volumes were issued indicates the natural desire of a great author to save some part of his work from destruction, and the appearance of a supposititious nephew's name on the title-pages of the last four volumes indicates the equally natural desire of a prominent monk to avoid conflict with the authorities. A sixth volume of dramatic pieces, consisting of light comedies, was announced; but the project was abandoned. That dramatic composition still entertained the scanty leisure of Tirso's old age is shown by the fact that the fragmentary autograph copy of *Las Quinas de Portugal* is dated the 8th of March 1638; but his active career as a dramatist ended two years earlier. He was absorbed by other duties. As official chronicler of his order, he compiled the elaborate *Historia de la merced*, which occupied him till the 24th of December 1639, and still survives in manuscript. As a tribute to the count de Sástago, who had accepted the dedication of the fourth part of the plays, and who had probably helped to defray the publishing expenses, Tirso de Molina is said to have compiled the *Genealogía de la casa de Sástago* (1640), but the ascription of this genealogical work is disputed. On the 29th of September 1645 Tirso de Molina became superior of the monastery at Soria, and died there on the 12th of March 1648.

It is only within the last few years that it has become possible to give an outline of his life; it will always be impossible for posterity to do justice to his genius, for but a fraction of his plays have been preserved. The earliest of his extant pieces is dated 1605 and bears no sign of immaturity; in 1624 he had written three hundred plays, and in 1634 he stated that he had composed four hundred within the previous twenty years; of this immense production not more than eighty plays are in existence. Tirso de Molina is universally known as the author of *El Burlador de Sevilla y convidado de piedra*, the piece in which Don Juan is first presented on the stage; but *El Burlador de Sevilla* represents only one aspect of his genius. No less remarkable than his representation of perverse depravity in *El Burlador de Sevilla* is his dramatic treatment of a philosophical enigma in *El Condenado por desconfiado*. Though manifestly attracted by exceptional cases, by every kind of moral aberration, by the infamous and the terrible, his range is virtually unlimited. He reveals himself as a master of historical interpretation in *La Prudencia de la mujer* and of tragical pathos in *La Venganza de Tamar*; his sympathetic, malicious wit finds dramatic expression in *El Vergonzoso en palacio* and *Don Gil de las calzas verdes*, and the fine divination of feminine character in *Averígüelo Vargas* and *La Villana de Vallecas* is incomparable. Tirso de Molina has neither Lope de Vega's inventive resource, nor his infinite seduction; he has neither Calderón's idealistic visions, nor his golden music; but he exceeds Lope in massive intellectual power and in artistic self-restraint, and he exceeds Calderón in humour, in creative faculty, and in dramatic intuition. That his reputation extended beyond the Pyrenees in his own lifetime may be gathered from the fact that J. Shirley's *Opportunity* is derived from *El Castigo del penséque*; but he was neglected in Spain itself during the long period of Calderón's supremacy, and his name was almost forgotten till the end of the 18th century, when some of his pieces were timidly recast by Dionisio Solís and later by Juan Carretero. The renaissance of his fame, however, dates from 1839–1842, when an incomplete but serviceable edition of his plays was published by Hartzenbusch; and he is now accepted as among the greatest dramatists of Spain.

TIRUPATI, or Tripetty, a town of British India, in the North Arcot district of Madras, with a station on the Madras railway, 84 m. N.E. of Madras city. Pop. (1901), 15,485. It is famous for a temple on the neighbouring hill of Tirumala, 2500 ft. above the sea, which is one of the most frequented places of pilgrimage in southern India. The town contains numerous temples connected with the shrine of Tirumala, and is noted for its brass-work and wood-carving.

TIRYNS, the *Τίρυνς τειχιόεσσα* of Homer (*Il.* ii. 559), a small Peloponnesian city, in the prehistoric period of the Achaean race, long before the Dorian immigration. It stood on a small rock in the marshy plain of Argolis, about 3 m. from the sea, and was fabled to have been founded by King Proetus, the brother of Acrisius, who was succeeded by the hero Perseus. It was the scene of the early life of Heracles, who is hence called Tirynthius. The massive walls, which appear to be of earlier

1, Main gate in the outer wall.
2, Inner gate, approached between massive walls.
3, Main propylaeum.
4, Inner propylaeum.
5, Court (*αὐλή*) surrounded by a colonnade on three sides: the altar to Zeus Herceus is by the entrance.
6, *Αἴθουσα*, portico of the megaron.
7, *Πρόδομος*, inner porch.
8, Megaron, with roof supported on four columns, and the circular hearth in the middle.
9, Bath-room and small *θάλαμοι*.
10, 10, Chambers round the great court.
11, 11, Guard chambers by the main propylaeum.
12, Passage (*λαύρη*) from the main propylaeum to the second house.
13, 13, Courts of the second house.
14, Megaron.
15, Chambers (*θάλαμοι*).
16, Passage to the rock-cut stairs.
17, Small postern door in the semicircular bastion, approached by flight of rock-cut steps.
18, 18, Massive outer wall of city.
19, Inner wall to guard the entrance passage.
20, Part of outer wall, with intermediate passage and rows of chambers, as shown in fig. 2.

type than those of Mycenae, were said to have been the work of Cyclopean masons. Its period of greatest splendour was probably between the 14th and 12th centuries B.C.; in Homeric and subsequent times it was usually subject to Argos. The palace was probably burnt at the time of the Dorian conquest. After the Spartan defeat of Argos in 494 B.C. Tiryns regained temporary independence, and the Tirynthians fought on the Greek side at Plataea, while the Argives held aloof. Soon after, in 468 B.C., Tiryns was finally destroyed through the jealousy of the Argives, and the site has been deserted ever since, but for a brief occupation in Byzantine times.

Excavations made in 1884–1885 by Schliemann and Dörpfeld over part of the rock on which Tiryns stood have exposed a most interesting building, which offers the most complete example of a palace of the Mycenaean age in Greece. The rock on which Tiryns is built is of an irregular oval shape, about 330 yds. long by 112 at the widest part, and is surrounded by a very massive wall, varying from 30 to 40 ft. in thickness and averaging when complete about 50 ft. in height, measuring from its base outside. Inside, the wall was probably not more than 10 or 12 ft. high above the ground, so the masonry acts as a retaining wall to a considerable depth of earth which covers the rock (see fig. 2 below). The wall is built of very large hammer-dressed blocks, some as much as 10 ft. long by 3 ft. 3 in. or 3 ft. 6 in. wide, with smaller ones to fill up the interstices. The whole was bedded, not in mortar, but in clay, which has mostly been washed out of the joints; originally the surface was probably protected with a coating of stucco. The only important gateway, which was on the east side, away from the sea, probably resembled the "lion gate" at Mycenae. The other entrances are mere slits in the wall. One of these and the chief gate are shown in fig. 1. Internally the area of the city was divided by cross walls into three parts at successive levels. The lowest and middle divisions have not yet been excavated; the upper part at the south end of the rock was completely exposed in 1884–1885 by Schliemann and Dörpfeld, and the almost complete plan of the various structures clearly made out. This division contains the palace of the ruler of Tiryns, a building which shows careful and skilful construction, elaborate decoration, and a well-arranged plan, suitable to the wants of a wealthy autocratic chief, who lived in a manner which partly recalls the luxury of an Oriental king, and also resembled the feudal state of a medieval baron, surrounded by a crowd of vassals. From the main gate, which was defended by a tower, a strong passage led between the outer wall and an inner one to an inner gate, thence to a propylaeum or double porch, with two wooden columns on each side, adjoining which were chambers for guards. Then came another similar, but smaller propylaeum, and opposite to that was the entrance to the great court (*αὐλή*), nearly 53 by 70 ft., in which stands an altar or pit of sacrifice, in a position similar to that occupied by the altar of Zeus Herceus in the later Greek house. This court was surrounded by wooden columns supporting a roof, like a medieval cloister; on the south side are chambers for attendants (*θάλαμοι*). On the north side is the great hall (*μέγαρον*), with an outer portico supported by two columns (*αἴθουσα*) and an inner vestibule (*πρόδομος*) with three doors. The hall is about 40 by 30 ft., with a circular hearth in the centre (*ἑστία* or *ἐσχάρα*). Four columns supported the roof, the central part of which probably rose above the rest like a medieval "lantern." On the west side of the hall are a

C, Chambers in the thickness of the wall opening out of the gallery.
D, Gallery, with roof formed of projecting courses of stone in large blocks.
E. Top of main wall, paved with clay, level with the inside.
F, Wooden columns on existing stone bases, forming a porticus or covered walk along the top of the wall.
G, Outer wall of the colonnade built of brick, now missing.
H, Probable roof of the colonnade of wood, covered with beaten clay.

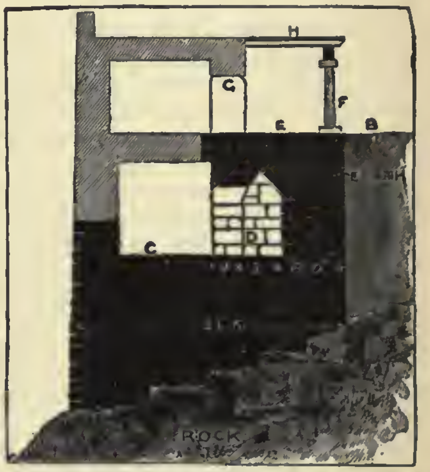

Fig. 2.—Section through the Outer Wall of the City at 20 in fig. 1.

number of small chambers (*θάλαμοι*), and a bathroom about 12 by 10 ft., with its floor formed of one great slab of stone, sloped so as to drain out at one side through a pipe which passes through the wall. In addition to this there is also a second system, with open courts, hall and chambers; this has been generally supposed to be the women's quarters, but there is no authority for such duplication, and it is possible that it should rather be explained as another house. It is approached in a very circuitous way, either by a passage (*λαύρη*) leading from a side door in the main propylaeum or by another long passage which winds round the back of the chief hall, and so leads by a long flight of steps, cut in the rock, to the little postern door in the semicircular bastion. A staircase led to an upper floor. The circuit wall round the palace is more strongly constructed than the rest. On the south is a gallery built in the thickness of the wall, and roofed by projecting courses of stone; and chambers or storehouses open out of this gallery. The wall on the east side has a similar arrangement (see fig. 2). At the top level the wall was covered by a colonnade of wooden pillars resting on circular stone blocks. This supported a flat roof and was open to the inside of the fortress. The back of the colonnade was built of brick, and is now missing, as are all the brick parts of the palace, owing to the bricks having been only sun-dried.

The methods of construction employed in the Tiryns palace are of the highest interest. The foundations and about 3 ft. of the walls above the ground are made of large blocks of stone bedded in clay; above this the wall was of brick, sun-dried, and covered with stucco. The upper storey was probably of wood. Some of the thresholds of the doors were massive blocks of stone (λάϊνος οὐδός); others were of wood (δρύϊνος οὐδός). Wood was also used for all the columns, doorposts, and antae (παραστάδες), and in some cases the walls of the rooms were lined with wood, carefully fixed by dowels, the holes for which still exist. The doors had pivots of bronze revolving in well-fitted bronze cup-like sockets let into the thresholds. In the megaron and other rooms the floors are of good concrete decorated with a simple series of incised lines, coloured blue and red. The stucco of the internal wall is decorated with bold and very effective patterns—birds and scroll-work and other decorative designs. The best preserved painting shows a scene from a bull-fight. Both subjects and style show close analogy to the paintings in the palace at Cnossus in Crete. One example of rich and costly decoration remains—part of a frieze of white alabaster, sculptured in relief with rosettes and interlacing patterns, and studded with jewel-like pieces of blue glass or enamel, the θριγκὸς κυάνοιο of *Od.* vii. 87. Further excavations in the lower parts of the city will probably bring to light the dwellings of the citizens who garrisoned the place. The great bulk of the Tirynthians must have lived in houses outside the citadel, but under the shelter of its protection, just as in medieval Italy villages grew up round the castles of any powerful lord. The relation of the palace at Tiryns to those described in the Homeric poems has given rise to much discussion. The case is somewhat altered by the discovery of several other early houses, of similar character, but not identical in plan, at Mycenae and elsewhere in Greece; these do not, for example, show the duplication of the essential parts of the house found at Tiryns. It is now generally recognized that, while the general character of the palace at Tiryns is invaluable as illustrating the type of house in the mind of the Homeric poet, it is a mistake to appeal to it for the explanation of details of arrangement such as probably varied considerably according to the conditions and requirements in different cases.

(J. H. M.; E. Gr.)

TISCHENDORF, LOBEGOTT FRIEDRICH KONSTANTIN VON (1815–1874), German biblical critic, the son of a physician, was born on the 18th of January 1815 at Lengenfeld, near Plauen, in the Saxon Vogtland. From the gymnasium at Plauen he passed in 1834 to the university of Leipzig, where he was mainly influenced by J. G. B. Winer (1789–1858), and began to take special interest in New Testament criticism. In 1838 he took the degree of doctor of philosophy, and then became master at a school near Leipzig. After a journey through southern Germany and Switzerland, and a visit to Strassburg, he returned to Leipzig, and set to work upon a critical study of the New Testament text, following the guidance of Karl Lachmann. In 1840 he qualified as university lecturer in theology with a dissertation on the recensions of the New Testament text, the main part of which reappeared in the following year in the prolegomena to his first edition of the New Testament. These early textual studies convinced him of the absolute necessity of new and exacter collations of MSS. From October 1840 till January 1843 he was in Paris, busy with the treasures of the great library, eking out his scanty means by making collations for other scholars, and producing for the publisher, F. Didot, several editions of the Greek New Testament, one of them exhibiting the form of the text corresponding most closely to the Vulgate. The great triumph of these laborious months was the decipherment of the palimpsest *Codex Ephraemi Syri Rescriptus*, of which the New Testament part was printed before he left Paris and the Old Testament in 1845. His success in dealing with a MS. much of which, owing to the fact that it had been rewritten with the works of Ephraem Syrus, had been illegible to earlier collators, brought him into note and gained support for more extended critical expeditions. From Paris he had paid short visits to Holland (1841) and England (1842). In 1843 he visited Italy, and after a stay of thirteen months went on to Egypt, Sinai, Palestine and the Levant, returning by Vienna and Munich.[1] From Sinai he brought a great treasure, forty-three leaves of what is now known as the *Codex Sinaiticus*. He kept the place of discovery a secret, and the fragments were published in 1846 as the *Codex Friderico-Augustanus*, a name given in honour of the king of Saxony. He now became professor extraordinarius in Leipzig, and married (1845). In the same year he began to publish an account of his travels in the East (2 vols., 1845–1846). In 1850 appeared his edition of the *Codex Amiatinus* and of the Septuagint version of the Old Testament (7th ed., 1887); in 1852, amongst other works, his edition of the *Codex Claromontanus*. In 1853 and 1859 he made a second and a third voyage to the East. In the last of these, in which he had the active aid of the Russian government, he at length got access to the remainder of the precious Sinaitic codex, and persuaded the monks to present it to the tsar, at whose cost it was published in 1862 (in four folio volumes). In 1869 he was given the style of "von" Tischendorf as a Russian noble. Meanwhile, in 1859, he had been made professor ordinarius of theology and of biblical palaeography, this latter professorship being specially created for him; and another book of travel, *Aus dem heiligen Lande*, appeared in 1862. Tischendorf's Eastern journeys were rich enough in other discoveries to deserve the highest praise.[2] Side by side with his industry in collecting and collating MSS., Tischendorf pursued a constant course of editorial labours, mainly on the New Testament, until he was broken down by overwork in 1873. He died on the 7th of December 1874 at Leipzig.

The great edition, of which the text and apparatus appeared in 1869 and 1872,[3] was called by himself *editio viii.*; but this number is raised to twenty or twenty-one if mere reprints from stereotype plates and the minor editions of his great critical texts are included; posthumous prints bring up the total to forty-one. Four main recensions of Tischendorf's text may be distinguished, dating respectively from his editions of 1841, 1849, 1859 (*ed. vii.*), 1869–1872 (*ed. viii.*). The edition of 1849 may be regarded as historically the most important from the mass of new critical material it used; that of 1859 is distinguished from Tischendorf's other editions by coming nearer to the received text; in the 8th edition the testimony of the Sinaitic MS. received great (probably too great) weight. The readings of the Vatican MS. were given with more exactness and certainty than had been possible in the earlier editions, and the editor had also the advantage of using the published labours of S. P. Tregelles.

Much less important was Tischendorf's work on the Greek Old Testament. His edition of the Roman text, with the variants of the Alexandrian MS., the Codex Ephraemi and the Friderico-Augustanus, was of service when it appeared in 1850, but, being stereotyped, was not greatly improved in subsequent issues. Its imperfections, even within the limited field it covers, may be judged by the aid of C. E. Nestle's appendix to the 6th issue (1880). Besides this may be mentioned editions of the New Testament Apocrypha [*De Evangeliorum apocryphorum origine et usu* (1851); *Acta Apostolorum apocrypha* (1851); *Evangelia apocrypha* (1853; 2nd ed., 1876); *Apocalypses apocryphae* (1866)] and various minor writings, in part of an apologetic character, such as *Wann wurden unsere Evangelien verfasst?* (1865; 4th ed., 1866), *Haben wir den echten Schrifttext der Evangelisten und Apostel?* (1873), and *Synopsis evangelica* (7th ed., 1898).

See, in addition to the handbooks on New Testament criticism, Carl Bertheau's article on Tischendorf in Herzog-Hauck, *Realencyklopädie* (3rd ed., 1907).

TISIO (or Tisi), **BENVENUTO** (1481–1559), commonly called Il Garofalo, Italian painter of the Ferrarese school, was born in

[1] See his *Reise in den Orient* (Leipzig, 1845–1846).

[2] The MSS. brought to Europe on the first two journeys are catalogued in the *Anecdota sacra et profana* (Leipzig, 1855, enlarged 1861). See also the *Monumenta sacra inedita* (Leipzig, 1846), and *Nova collectio* of the same (1855–1869). The 3rd volume of the *Nova collectio* gives the results of his last Eastern journey.

[3] The prolegomena remained unfinished at his death, and have been supplied by C. R. Gregory (cf. his *Textkritik des Neuen Testamentes*, vol. i., 1900).

1481 at Garofolo, in the Ferrarese territory, and constantly used the gillyflower (*garofalo*) as a symbol with which to sign his pictures. He took to drawing in childhood, and was put to study under Domenico Panetti (or Laneto), and afterwards at Cremona under his maternal uncle Niccolò Soriani, a painter who died in 1499; he also frequented the school of Boccaccio Boccaccino. He stayed fifteen months with Giovanni Baldini in Rome, acquiring a solid style of draughtsmanship, and was two years with Lorenzo Costa at Mantua. He then entered the service of the marquis Francesco Gonzaga. Afterwards he went to Ferrara, and worked there four years. Attracted by Raphael's fame, and invited by a Ferrarese gentleman, Geronimo Sagrato, he again removed to Rome, and found the great painter very amicable; here he stayed two years, rendering some assistance in the Vatican frescoes. From Rome family affairs recalled him to Ferrara; there Duke Alphonso I. commissioned him to execute paintings, along with the Dossi, in the Villa di Belriguardo and in other palaces. Thus the style of Tisio partakes of the Lombard, the Roman and the Venetian modes. He painted extensively in Ferrara, both in oil and in fresco, two of his principal works being the "Massacre of the Innocents" (1519), in the church of S. Francesco, and the "Betrayal of Christ" (1524), accounted his masterpiece. For the former he made clay models for study and a lay figure, and executed everything from nature. He continued constantly at work until in 1550 blindness overtook him, painting on all feast-days in monasteries for the love of God. He had married at the age of forty-eight, and died at Ferrara on the 6th (or 16th) of September 1559, leaving two children.

Garofalo combined sacred inventions with some very familiar details. A certain archaism of style, with a strong glow of colour, suffices to distinguish from the true method of Raphael even those pictures in which he most closely resembles the great master—this sometimes *very* closely; but the work of Garofalo is seldom free from a certain trim pettiness of feeling and manner. He was a friend of Giulio Romano, Giorgione, Titian and Ariosto; in a picture of "Paradise" he painted Ariosto between St Catherine and St Sebastian. In youth he was fond of lute-playing and also of fencing. He ranks among the best of the Ferrarese painters; his leading pupil was Girolamo Carpi. The "Adoration of the Magi," in the church of San Giorgio near Ferrara, and a "Peter Martyr," in the Dominican church, Ferrara (sometimes assumed to have been done in rivalry of Titian), are among his principal works not already mentioned. The National Gallery, London, contains four, one of them being a Madonna and Christ enthroned, with St Francis and three other saints.

TISSAPHERNES (Pers. *Cithrafarna*), Persian soldier and statesman, son of Hydarnes. In 413 he was satrap of Lydia and Caria, and commander in chief of the Persian army in Asia Minor (Thuc. viii. 5). When Darius II. ordered the collection of the outstanding tribute of the Greek cities, he entered into an alliance with Sparta against Athens, which in 412 led to the conquest of the greater part of Ionia. But Tissaphernes was unwilling to take action and tried to achieve his aim by astute and often perfidious negotiations; Alcibiades persuaded him that Persia's best policy was to keep the balance between Athens and Sparta, and rivalry with his neighbour Pharnabazus of Hellespontic Phrygia still further lessened his energy. When, therefore, in 408 the king decided to support Sparta strenuously, Tissaphernes was removed from the generalship and limited to the satrapy of Caria, whereas Lydia and the conduct of the war were entrusted to Cyrus the Younger. On the downfall of Athens, Cyrus and Tissaphernes both claimed jurisdiction over the Ionian cities, most of which acknowledged Cyrus as their ruler; but Tissaphernes took possession of Miletus, where he was attacked by Cyrus, who gathered an army under this pretence with the purpose of using it against his brother Artaxerxes II. The king was warned by Tissaphernes, who took part in the battle of Cunaxa, and afterwards tried to destroy the Greek mercenaries of Cyrus by treachery. He was then sent back to Asia Minor to his old position as general in chief and satrap of Lydia and Caria. He now attacked the Greek cities, to punish them for their allegiance to Cyrus. This led to the war with Sparta in 399. Tissaphernes, who once again had recourse to subtle diplomacy, was beaten by Agesilaus on the Pactolus near Sardis (395); and at last the king yielded to the representations of Pharnabazus, strongly supported by the chiliarch (vizier) Tithraustes and by the queen-mother Parysatis, who hated Tissaphernes as the principal cause of the death of her favourite son Cyrus. Tithraustes was sent to execute Tissaphernes, who was lured to Colossae and slain in 395.

(Ed. M.)

TISSERAND, FRANÇOIS FÉLIX (1845–1896), French astronomer, was born at Nuits-Saint-Georges, Côte-d'Or, on the 13th of January 1845. In 1863 he entered the École Normale Supérieure, and on leaving he went for a month as professor at the lycée at Metz. Le Verrier offered him a post in the Paris Observatory, which he accordingly entered as *astronome adjoint* in September 1866. In 1868 he took his doctor's degree with a brilliant thesis on Delaunay's Method, which he showed to be of much wider scope than had been contemplated by its inventor. Shortly afterwards he went out to Malacca to observe the famous solar eclipse of the 18th of August 1868. In 1873 he was appointed director of the observatory at Toulouse, whence he published his *Recueil d'exercices sur le calcul infinitésimal*, and in 1874 became corresponding member of the Académie des Sciences. He took part in the French expeditions of 1874 to Japan, and in 1882 to Martinique to observe the transits of Venus. In 1878 he was elected a member of the Académie des Sciences in succession to Le Verrier, and became a member of the Bureau des Longitudes. In the same year he was appointed *professeur suppléant* to Liouville, and in 1883 he succeeded Puiseux in the chair of celestial mechanics at the Sorbonne. Tisserand always found time to continue his important researches in mathematical astronomy, and the pages of the *Comptes rendus* bear witness to his surprising activity. His writings relate to almost every branch of celestial mechanics, and are always distinguished by rigour and simplicity in the solution of the most difficult problems. He treated in a masterly manner (*Bulletin astronomique*, 1889) the theory of the capture of comets by the larger planets, and in this connexion published his valuable *Criterion* for establishing the identity of a periodic comet, whatever may have been the perturbations brought about in its orbit, between successive appearances, by the action of a planet. His principal work, *Traité de mécanique céleste*, is the noblest and most lasting monument to his memory, and is worthy to stand beside the *Mécanique céleste* of his fellow-countryman, Laplace. In this treatise, published in four quarto volumes, the last of which appeared only a few months before his death, he fused into one harmonious whole the researches of Laplace and those of other workers in the same field since his time. It furnishes a faithful and complete *résumé* of the state of knowledge in that department of astronomy at the end, as Laplace's great work did for the beginning, of the 19th century. In 1892 he succeeded Mouchez as director of the Paris Observatory, and as president of the committee of the photographic chart of the heavens he contributed largely to the success of that great project. Under his direction the revision of Lalande's catalogue was brought almost to completion, and four volumes of the *Annales de l'Observatoire de Paris* exhibit the progress made in this important undertaking. He was also editor of the *Bulletin astronomique* from the beginning, and contributed many important articles to its pages. He died suddenly, in the fullness of his power, of congestion of the brain, on the 20th of October 1896.

(A. A. R.)

TISSOT, JAMES JOSEPH JACQUES (1836–1902), French painter, was born at Nantes on the 15th of October 1836. He studied at the École des Beaux Arts in Paris under Ingres, Flandrin and Lamothe, and exhibited in the Salon for the first time at the age of twenty-three. In 1861 he showed "The Meeting of Faust and Marguerite," which was purchased by the state for the Luxembourg Gallery. His first characteristic period made him a painter of the charms of women. *Demi-mondaine* would be more accurate as a description of the series of studies which he called *La Femme à Paris*. He fought in the Franco-German War, and, falling under suspicion as a Communist, left Paris for London. Here he studied etching with Sir Seymour Haden, drew caricatures for *Vanity Fair*, and painted portraits as well as genre subjects. It was many years before he turned to the chief labour of his career—the production of a series of 700 water-colour drawings to illustrate the life of Christ and the Old Testament. Some sudden shock or bereavement was said to have turned his thoughts from ideals of the café and the boulevard into a more serious channel. He disappeared from Paris, whither he had returned after a stay of some years in England, and went to Palestine. In 1895 the series of 350 drawings of incidents in the life of Christ was exhibited in Paris, and the following year found them on show in London. They were then published by the firm of Lemercier in Paris, who had paid him 1,100,000 francs for them. After this he turned to the scenes of the Old Testament, upon which he was still engaged at the abbey of Buillon, in the department of Doubs, France, when he died on the 8th of August 1902. The merits of Tissot's Bible illustrations lay rather in the care with which he studied the details of scenery than in any quality of religious emotion. He seemed to aim, above all, at accuracy, and, in his figures, at a vivid realism, which was far removed from the conventional treatment of sacred types.

TISSOT, PIERRE FRANÇOIS (1768–1854), French man of letters, was born at Versailles on the 10th of March 1768. His father, a native of Savoy, was a perfumer appointed by royal warrant to the court. At the age of eighteen he entered the office of a *procureur* of the Châtelet, in order to learn the practice of the law; but he cultivated the Muses rather than the study of procedure, and, being a handsome youth, was occasionally invited to the fêtes of the Trianon. He devoted himself ardently to the cause of the Revolution, in spite of the fact that it had ruined his family. While with the *procureur* he had made the acquaintance of Alexandre Goujon, and they soon became inseparable; he married Goujon's sister, Sophie (March 5, 1793), and when his brother-in-law was elected deputy to the Convention and sent on a mission to the armies of the Moselle and Rhine, Tissot went with him as his secretary; he then returned to Paris and resumed his more modest position of *secrétaire général des subsistances*. On the 1st of Prairial he tried in vain to save his brother-in-law, who had been involved in the proscription of the "last Montagnards"; all he could do was to give Goujon the knife with which he killed himself in order to escape the guillotine, and he afterwards avenged his memory in the *Souvenirs de Prairial*. He also took under his care Goujon's widow and children. His connexion with the Jacobin party caused him to be condemned to deportation after the attempt of the 3rd Nivose in the year IX., but Bonaparte, having been persuaded to read his translation of the *Bucolics*, struck his name off the list. Though still a friend of the Republic, Tissot was henceforth an admirer of the First Consul; he celebrated in verse several of the emperor's victories, and the arrival in France of Marie-Louise (1810). So far he had lived on the income derived from a factory of horn lanterns in the Faubourg St Antoine; and, being at last in fairly comfortable circumstances he now devoted himself to literature. The abbé Delille took him as his assistant at the Collège de France; and Tissot succeeded him as head of it (1813); the emperor signed the appointment as a reward for a poem composed by Tissot on his victory at Lützen. He was removed from this post, however, in 1821, in consequence of the publication of a *Précis sur les guerres de la révolution*, in which rather colourless work he had dared to say that the Convention had saved France and vanquished the Coalition. Deprived of his post, Tissot was left still more free to attack the government in the press. He was one of the founders of the newspaper *Le Constitutionnel*, and of the review, the *Minerve*. Without laying stress on his literary works (*Traité de la poésie latine*, 1821; translation of the *Bucolics*, 3rd ed., 1823; *Études sur Virgile*, 1825) we should mention the *Mémoires historiques et militaires sur Carnot*, which he based on the papers left by the "Organizer of Victory" (1824), the *Discours du Général Foy* (1826) and a *Histoire de la guerre de la Péninsule* also inspired by Général Foy (1827). On the overthrow of Charles X., Tissot made a successful effort to regain his position at the Collège de France; he was also elected as a member of the French Academy on the death of Dacier (1833). It was then that he published his chief works: *Histoire de Napoléon* (2 vols., 1833), and *Histoire complète de la révolution française de 1789 à 1806* (6 vols., 1833–1836), full of inconsistencies and omissions, but containing a number of the author's reminiscences; in some places they become practically memoirs, and are consequently of real value. In 1840 a carriage accident almost cost him his sight; he had to find an assistant, and passed the last years of his life in circumstances of increasing suffering, amid which, however, he preserved his cheerfulness and goodness of heart. He died at Paris on the 7th of April 1854.

See an excellent essay on Tissot by P. Fromageot in the *Revue de Versailles et de Seine-et-Oise*, in 1901.

TISSUE (Fr. *tissu*, *tissue*, participle of *tisser*, Lat. *texere*, to weave), properly the name of a fine textile fabric interwoven with gold and silver threads, hence used of any delicate or gauzy fabric (see GOLD AND SILVER THREAD). It was also early applied, as in French, to a ribbon, fillet or various forms of woven ligaments. In biology the word is of general use for an aggregate of cells forming a texture or fabric; in animal anatomy it is thus applied to the primary layers of which the parts are composed, and named by some qualifying word denoting its substance or its use (see CONNECTIVE TISSUE and EPITHELIAL, ENDOTHELIAL AND GLANDULAR TISSUE).

TISTA, a river of northern India, which rises on the edge of the Tibetan plateau, and flows through the mountain gorges of Sikkim and Darjeeling, till it spills itself over the plain of Eastern Bengal. In the 18th century its course was due south to join the Ganges; but in 1787 great floods diverted the stream towards the south-east, and it now enters the Brahmaputra, the whole district of Rangpur being scored by various interlacing channels. Its total length in British territory is about 170 m.

TISZA, KÁLMÁN [KOLOMAN] (1830–1902), Hungarian statesman, was born at Geszt on the 10th of December 1830, the son of Lajos Tisza and the countess Julia Teleki, and was educated at his father's castle. In 1848 he obtained a post in the ministry of instruction of the revolutionary government which he accompanied to Debreczen. After the war he went abroad with most of his family, and carefully studied foreign institutions. On returning home he devoted himself to the improvement of the family estates, and in 1855 was elected assistant curator of the Calvinist church at Nagyszalonta, in succession to his father. When, on the 1st of September 1859, the Austrian government issued the "Patent" which struck at the very roots of Protestant autonomy in Hungary, Tisza, at the congress of the Calvinist Church beyond the Theiss, held at Debreczen, publicly repudiated the Patent on behalf of the Calvinist laity. He renewed his opposition in the most uncompromising terms at the ensuing congress (Jan. 11, 1860), shrewdly guessing that the Patent was directed as much against the Hungarian constitution as against the Calvinist confession. His fears were justified by the October Diploma (see HUNGARY: *History*), which he attacked with equal vehemence. In August 1860 Tisza married the countess Helen Degenfeld-Schomburg, a union which brought him into close connexion with the Karolyis, the Podmaniczkys and the Odescalchis. He was unanimously elected to represent Debreczen at the 1861 Diet, and was elected vice-president of the house at its second session. The Diet was divided between the Addressers, led by Deák, and the "Resolutionists," led by Count László Teleki, and on the death of the latter Tisza succeeded him as the leader of the more radical party. During the Provisorium (1861–1865) Tisza fought for constitutional reform in the columns of the *Hon* and the *Magyar Sajtó*, his leading articles, afterwards collected and published under the title of *Alföldi Levelek* (Letters from the Alföld), being by far the most important contribution to the controversy. When the Diet was again summoned by royal decree (Dec. 10, 1865), Tisza once more represented Debreczen and formed, with Kálmán Ghyczy (1808–1888), the Left-centre party. From 1867 onwards his influence continued to increase, despite the rupture of his party, which he reconstructed at the conference of Nagyvárad (March 17, 1868), when the famous *Bihari pontok*, or articles of Bihar, were subscribed. The *Bihari pontok* started from the assumption that Hungary was a free and independent state. They bound the Tisza party to repeal all laws or institutions contrary to, and to promote all measures necessary for, the national independence. Thus the delegation system and the common ministries were marked out for attack, while every effort was to be made to procure for Hungary a separate army, a separate diplomacy and a separate financial system. It was chiefly owing to the efforts of Tisza and his party that Austria remained neutral during the Franco-German War. His speech on the 3rd of March 1875 led to the resignation of Istoan Bittó's administration and the welding of Deák's followers and the Left-centre into a new party, the *Szabadelvü párt* or Free Principles Party, which took office under Bela Wenckheim (1811–1879), whom (Oct. 2) Tisza succeeded as prime minister, a post he held, with a few interruptions, for the next fifteen years (1875–1890). In 1877 he resigned on the discussion of the question of the Composition (Ausgleich), but he returned to office on his own terms. The same thing happened the following year, when his brief resignation compelled the Magyar Diet to agree to the occupation of Bosnia. In 1879 he materially contributed to the formation of the Austro-German alliance. Not till 1888, when the national army bill was introduced, did he encounter any serious opposition, but thenceforth his position became precarious. On the 13th of March 1890, on the occasion of the revision of the Indigenat Act, he resigned office, but continued, as deputy for Nagyvárad to place his vast political experience at the disposal of the house. It is no exaggeration to say that Hungary owes to Klámán Tisza a consolidated government, the formation of a parliamentary majority, a healthy public spirit, public credit, the reform of the Upper House, an admirable educational system, economical, and particularly railway, development, and administrative and judicial reconstruction on modern lines. His opponents have accused him of unscrupulousness and party spirit, but not one of them can deny that he reshaped Hungary and made her the leading partner of the dual monarchy. As to his personal integrity and disinterestedness there has never been the slightest doubt. It is an open secret that, on the retirement of Andrassy, he was offered the chancellorship. He refused it because, to use his own expression, "I am as wholly and solely Hungarian as the river (Theiss, Hung. *Tisza*) whose name I bear."

See Imre Visi, *Kálmán Tisza, a political appreciation* (Hung.; Budapest, 1885); Kornel Abrányi, *Kálmán Tisza Life and Political Career* (Hung.; Budapest, 1878); G. Gratz, *Kálmán Tisza* (*Modern Magyar Statesmen*, I.) (Hung.; Budapest, 1902); P. Busbach, *The Last Five Years* (Hung.; Budapest, 1895).

His youngest son, Count STEPHEN TISZA (1861–   ), was born on the 22nd of April 1861. After being educated at Berlin, Heidelberg and Budapest, he entered the ministry of the interior for the purpose of studying technical and economical questions at the fountain-head, and soon became a specialist in agrarian matters. His *Magyar agrárpolitik* (Budapest, 1897), authoritative on its subject, was translated into German the same year (Leipzig). In 1886 Tisza began his parliamentary career, speedily becoming a leading member of the principal committees on economical and educational questions. On the resignation of Kálmán Szell (June 17, 1903) he was entrusted with the formation of a ministry of pacification, but abandoned the attempt on finding it impossible to secure a majority. On the 27th of October, however, with the assistance of the Free Principles Party, he succeeded in composing a cabinet, in which he was minister of the interior as well as premier. From the first the ministry was exposed to the most unscrupulous opposition, exacerbated by the new and stringent rules of procedure which Tisza felt it his duty to introduce if any business were to be done. The motion for their introduction was made by the deputy Gábor Daniel, supported by the premier, and after scenes of unheard-of obstruction and violence (Nov. 16–18) the speaker, in the midst of an ear-splitting tumult, declared that the new regulations had been adopted by the house, and produced a royal message suspending the session. But the Andrassy group, immediately afterwards, separated from the Free Principles Party, and during the rest of the year the Opposition made legislation impossible. By January 1905 the situation had become *ex lex* or anarchical. Tisza stoutly stood by his rules, on the ground that this was a case in which the form must be sacrificed to the substance of parliamentary government. But his appeal to the country at the beginning of 1905 was unsuccessful, and his opponents triumphed by a large majority. Tisza thereupon resigned and retired from public life. (R. N. B.)

TITANIUM [symbol Ti, atomic weight 48·1 (O = 16)], a metallic chemical element. Its discovery as an element was due to William Gregor in 1789 who found in the mineral ilmenite or menachinite a new earth, which was regarded as the oxide of a new metal, menachin. Independently of him Klaproth in 1793 discovered a new metal in rutile, and called it titanium; he subsequently found that it was identical with Gregor's element. Klaproth, however, was unable to prepare the pure oxide, which was first accomplished in 1821 by Rose. The isolation of the pure metal is of much later date. Titanium, although pretty widely diffused throughout the mineral kingdom, is not found in abundance. The commonest titanium mineral is rutile or titanium dioxide, TiO_2; anatase and brookite are crystalline allotropes. Titanium is most frequently found associated with iron; ilmenite (Ger. *Titan-eisen*) is $FeTiO_3$, perofskite $(Ca,Fe)TiO_3$, and the metal occurs in most magnetic iron ores. The titanates are well marked in the mineral kingdom. Ilmenite is isomorphous with geikielite, $MgTiO_3$, and pyrophanite, $MnTiO_3$; many of the "rare minerals"—aeschynite, euxenite, polycrase, &c.—contain titanates (and also niobates). Silicates also occur; sphene or titanite, $CaTiSiO_5$, is the commonest; keilhauite is rarer.

The isolation of metallic titanium is very difficult since it readily combines with nitrogen (thus resembling boron and magnesium) and carbon. In 1822 Wollaston examined a specimen of those beautiful copper-like crystals which are occasionally met with in iron-furnace slags, and declared them to be metallic titanium. This view had currency until 1849, when Wöhler showed that the crystals are a compound, $Ti(CN)_2 \cdot 3Ti_3N_2$, of a cyanide and a nitride of the metal. An impure titanium was made by Wöhler and Sainte-Claire Deville in 1857 by heating to redness fluotitanate of potassium (see below) in the vapour of sodium in an atmosphere of dry hydrogen, and extracting the alkaline fluoride formed by water. The metal thus produced formed a dark brown amorphous powder resembling iron as obtained by the reduction of its oxide in hydrogen. In 1887 Nilson and Petersson (*Zeit. phys. Chem.* 1, p. 25) obtained a purer product by heating the chloride with sodium in a steel cylinder; it then formed yellow scales with a bluish surface colour. H. Moissan (*Compt. rend.*, 1895, 120, p. 290) obtained a still purer metal by igniting the oxide with carbon in the electric furnace. The product has a brilliant white fracture, a specific gravity of 4·87, very friable, but harder than quartz or steel. Moissan (ibid., 1906, 142, p. 673) has distilled this metal in a very intense electric furnace. When heated in air it burns brilliantly with the formation of the oxide. It combines directly with the halogens, and dissolves in cold dilute sulphuric acid, in hot strong hydrochloric acid and in aqua regia, but less readily in nitric acid. Its most curious property is the readiness with which it unites with nitrogen. Several nitrides have been described. Ti_3N_4 is a copper-coloured powder obtained by heating the ammonio-chloride $TiCl_4 \cdot 4NH_3$ in ammonia. TiN_2 is a dark blue powder obtained when the oxide is ignited in an atmosphere of ammonia; while TiN is obtained as a bronze yellow mass as hard as the diamond by heating the oxide in an atmosphere of nitrogen in the electric furnace.

In its chemical relations, titanium is generally tetravalent, and occurs in the same sub-group of the periodic classification as zirconium, cerium and thorium. It forms several oxides, TiO_2, Ti_2O_3 and TiO_3 being the best known; others (some of doubtful existence) have been described from time to time.

Titanium dioxide, TiO_2, occurs in nature as the three distinct mineral species rutile, brookite and anatase. Rutile assumes tetragonal forms isomorphous with cassiterite, SnO_2 (and also zircon, $ZrSiO_4$); anatase is also tetragonal, and brookite or thorhombic. Rutile is the most stable and anatase the least, a character reflected in the decrease in density from rutile (4·2) and brookite (4·0) to anatase (3·9). The minerals are generally found together—a feature rarely met with in the case of polymorphs. They have been obtained artificially by Hautefeuille by the interaction of titanium fluoride and steam. At a red heat rutile is produced, at the boiling point of zinc brookite, and of cadmium anatase. It is apparent that these minerals all result in nature from pneumatolytic action. Amorphous titanium oxide may be obtained in a pure form by fusing the mineral, very finely powdered, with six times its weight of potassium bisulphate in a platinum crucible, then extracting the melt with cold water and boiling the filtered solution for a long time. Titanic oxide separates out as a white hydrate, which, however, is generally contaminated with ferric hydrate and often with tin oxide. A better method is Wöhler's, in which the finely powdered mineral is fused with twice its weight of potassium carbonate in a platinum crucible, the melt powdered and treated in a platinum basin with aqueous hydrofluoric acid. The alkaline titanate first produced is converted into crystalline fluotitanate, K_2TiF_6, which is with difficulty soluble and is extracted with hot water and filtered off. The filtrate, which may be collected in glass vessels if an excess of hydrofluoric acid has been avoided, deposits the greater part of the salt on cooling. The crystals are collected, washed, pressed and recrystallized, whereby the impurities are easily removed. The pure salt is dissolved in hot water and decomposed with ammonia to produce a slightly ammoniacal hydrated oxide; this, when ignited in platinum, leaves pure TiO_2 in the form of brownish lumps, the specific gravity of which varies from 3·9 to 4·25, according to the temperature at which it was kept in igniting. The more intense the heat the denser the product. The oxide is fusible only in the oxy-hydrogen flame. It is insoluble in all acids, except in hot concentrated sulphuric, when finely powdered. If the sulphuric acid solution be evaporated to dryness the residue, after cooling, dissolves in cold water. The solution, if boiled, deposits its titanic oxide as a hydrate called meta-titanic acid, $TiO(OH)_2$, because it differs in its properties from ortho-titanic acid, $Ti(OH)_4$, obtained by decomposing a solution of the chloride in cold water with alkalis. The ortho-body dissolves in cold dilute acids; the meta-body does not. If titanic oxide be fused with excess of alkaline carbonate a titanate, R_2TiO_3, is formed. This salt is decomposed by water with the formation of a solution of alkali free of titanium, and a residue of an acid titanate, which is insoluble in water but soluble in cold aqueous mineral acids. The titanates are very similar to the silicates in their tendency to assume complex forms, *e.g.* the potassium salts are $K_2TiO_3 \cdot 4H_2O$, $K_2Ti_2O_7 \cdot 3H_2O$ and $K_2Ti_6O_{13} \cdot 2H_2O$.

Titanium monoxide, TiO, is obtained as black prismatic crystals by heating the dioxide in the electric furnace, or with magnesium powder. *Titanium sesquioxide*, Ti_2O_2, is formed by heating the dioxide in hydrogen. A hydrated form is prepared when a solution of titanic acid in hydrochloric acid is digested with copper, or when the trichloride is precipitated with alkalis. *Titanium trioxide*, TiO_3, is obtained as a yellow precipitate by dropping the chloride into alcohol, adding hydrogen peroxide, and finally ammonium carbonate or potash. When shaken with potash and air it undergoes autoxidation, hydrogen peroxide being formed first, which converts the trioxide into the dioxide and possibly pertitanic acid; this acid may contain sexavalent titanium (see W. Manchot and Richter, *Ber.*, 1906, 39, pp. 320, 488, and also Faber, *Abst. Journ. Chem. Soc.* 1907, ii. 557.)

Titanium fluoride, TiF_4, is a fuming colourless liquid boiling at 284°, obtained by distilling a mixture of titanium oxide, fluorspar and sulphuric acid; by heating barium titanofluoride, $BaTiF_6$ (Emrich, *Monats.*, 1904, 25, p. 907); and by the action of dry hydrofluoric acid on the chloride (Ruff and Plato, *Ber.*, 1904, 37, p. 673). By dissolving the dioxide in hydrofluoric acid a syrupy solution is obtained which probably contains titanofluoric acid, H_2TiF_6. The salts of this acid are well known; they are isomorphous with the silico-, stanno- and zircono-fluorides. They are obtained by neutralizing the solution of the acid, or by fusing the oxide with potassium carbonate and treating the melt with hydrofluoric acid. Potassium titanofluoride, $K_2TiF_6 \cdot H_2O$, forms white, shining, monoclinic scales. When ignited in a current of hydrogen it yields *titanium trifluoride*, TiF_3, as a violet powder.

Titanium chloride, $TiCl_4$, is obtained as a colourless fuming liquid of 1·7604 sp. gr. at 0° C., boiling at 136·4° under 753·3 mm. pressure (T. E. Thorpe), by heating to dull redness an intimate dry mixture of the oxide and ignited lamp-black in dry chlorine. In the method of A. Stähler and H. Wirthwein, the titanium mineral is fused with carbon in the electric furnace, the carbides treated with chlorine, and the titanium chloride condensed. The distillate is freed from vanadium by digestion with sodium amalgam. Other methods are due to E. Vigouroux and G. Arrivaut (*Abst. Journ. Chem. Soc.*, 1907, ii. 97, 270) and Ellis (ibid., p. 270). By passing chloroform vapour over the heated dioxide the tetra- di- and tri-chlorides are formed, together with the free metal and a gaseous hydride, TiH_4 (Renz, *Ber.*, 1906, 39, p. 249). When dropped very cautiously into cold water it dissolves into a clear solution. According to the amount of water used, $TiCl_3OH$, $TiCl_2(OH)_2$, $TiCl(OH)_3$ or titanic acid is formed. The solution when boiled deposits most of its oxide in the meta-hydrate form. It forms addition compounds similar to those formed by stannic chloride, and combines with ammonia to form $TiCl_4 \cdot 8NH_3$ and $TiCl_4 \cdot 6NH_3$, both of which with liquid ammonia give titanamide, $Ti(NH_2)_4$. *Titanium dichloride*, $TiCl_2$, obtained by passing hydrogen over the trichloride at a dull red heat, is a very hygroscopic brown powder which inflames when exposed to air, and energetically decomposes water. *Titanium trichloride*, $TiCl_3$, forms involatile, dark violet scales, and is obtained by passing the vapour of the tetrachloride mixed with hydrogen through a red-hot tube, or by heating the tetrachloride with molecular silver to 200°. It is a powerful reducing agent.

Titanium tetrabromide, $TiBr_4$, is an amber-coloured crystalline mass. The *tetraiodide*, TiI_4, is a reddish brown mass having a metallic lustre. The *di-iodide*, TiI_2, is obtained as black lamella by passing the vapour of the tetraiodide over heated mercury in an atmosphere of hydrogen (E. Defacqz and H. Copaux, *Compt. rend.*, 1908, 147, p. 65). Sulphides are known corresponding to the best-known oxides.

Titanium sesquisulphate, $Ti_2(SO_4)_3 \cdot 8H_2O$, obtained by concentrating the violet solution formed when the metal is dissolved in sulphuric acid, is interesting since it forms a caesium alum, $CsTi(SO_4)_2 \cdot 12H_2O$. It gives the normal sulphate as a yellow, deliquescent, amorphous mass when treated with nitric acid.

Acid solutions of titanates are not precipitated by sulphuretted hydrogen; but ammonium sulphide acts on them as if it were ammonia, the sulphuretted hydrogen being liberated. Titanium oxide when fused with microcosmic salt in the oxidizing flame yields a bead which is yellowish in the heat but colourless after cooling. In the reducing flame the bead becomes violet, more readily on the addition of tin; in the presence of iron it becomes blood-red. Titanic oxides when fused on charcoal, even with potassium cyanide, yield no metal. Rose determined the atomic weight to be 47·72 (H = 1). A redetermination in 1885 by T. E. Thorpe gave the value 47·7 (see *Journ. Chem. Soc.*, 1885, p. 108).

TITANOTHERIIDAE (also known as Menodontidae and Brontotheriidae), a family of large rhinoceros-like perissodactyl ungulate mammals from the Oligocene and Eocene strata of North America. The cheek-teeth are low-crowned, with the external cones of the upper molars fused into a W-like outer wall, and the inner ones retaining a regular conical form; while in the lower teeth the crown is formed of crescentic ridges, of which there are three in the last and two each in the other teeth. There is generally little gap between the canines and the premolars.

Titanotherium, of the Oligocene of the Dakotas and neighbouring districts, was a huge beast, with the hinder upper premolars similar in character to the molars, a pair of horn-cores, arising from the maxilla, overhanging the nose-cavity, four front and three hind toes, only twenty dorso-lumbar vertebrae, and an almost continuous and unbroken series of teeth, in which the canines are short; the dental formula being *i.* $\frac{2}{1}$, *c.* $\frac{1}{1}$, *p.* $\frac{4}{4}$, *m.* $\frac{3}{3}$. The muzzle probably formed a snout in life; and there is presumptive evidence that these animals were very long-lived. *Brontops* seem scarcely separated from the type genus; but the name *Brontotherium* is applied to species with two pairs of incisor teeth in both jaws. The length of the largest species was about 14 ft.; and the height about 8 ft. The alleged occurrence of remains of members of the group in the Balkans apparently rests on insufficient evidence.

A second group is typified by *Palaeosyops*, of the Bridger Eocene of North America; *P. paludosus* being an animal about the size of a tapir. The skull, which has a longer face than in *Titanotherium*, lacks horn-cores, while all the upper premolars are simpler than the molars, and the full series of 44 teeth was present. The limbs were relatively slender, and the brain was small. In the lower, or Wasatch, Eocene the group was represented by the still more primitive *Lambdotherium*. On the other hand, *Palaeosyops* is connected with *Titanotherium* by means of *Telmatotherium* of the upper

Bridger and Washakia Eocene, a larger animal, with a longer and flatter skull, showing rudiments of horn-cores, only two pairs of lower incisors, and a general approximation in dental character to *Titanotherium*. Another of these titanotheroid forms is *Diplacodon*, from the Upper or Uinta Eocene; an animal the size of a rhinoceros, with the last two upper premolars molar-like. It was probably off the direct ancestral line of *Titanotherium*. These intermediate forms render the reference of the group to a distinct family—Palaeosyopidae—unnecessary.

Professor H. F. Osborn, who recognises four genera, *Titanotherium*, *Megacerops*, *Symborodon* and *Brontotherium*, in the typical section of the family, considers that each of these represents a distinct line of descent from the *Palaeosyops*-like group. The whole assemblage forms one of the four main sections of the Perissodactyla, namely the Titanotheroidea.

See H. F. Osborn, "The Cranial Evolution of Titanotherium," *Bull. Amer. Mus.* (1896), viii., 137, and the "Four Phyla of Oligocene Titanotheres," *op. cit.* (1903), xvi. 91; C. H. Earle, "A Memoir on the Genus *Palaeosyops* and its Allies," *Journ. Acad. Philadelphia* (1892), ix. 267. (R. L.*)

TITANS (Gr. Τιτᾶνες), in Greek mythology, the children of Uranus and Gaea. According to Hesiod (*Theog.* 133), the male Titans were Oceanus, Coeus, Crius, Hyperion, Iapetus and Cronus; the female, Thea, Rhea, Themis, Mnemosyne, Phoebe and Tethys, to whom Apollodorus adds Dione. At the instigation of Gaea they rebelled against their father, who had shut them up in the bowels of the earth, and set up as ruler their youngest brother, Cronus, who in turn was dethroned by his son Zeus. A struggle then ensued between Zeus and Cronus, in which the Titans took different sides. The opponents of Zeus were finally defeated, and imprisoned in Tartarus (*Theog.* 153–210, 617 sqq.). The rebellious Titans are the representatives of the wild, disorderly forces of nature, who are defeated by the Olympian deities, who stand for law and order. The name Titans is usually explained as "avengers," referring to the vengeance taken by Cronus on his father Uranus, but A. Dieterich (*Rheinisches Museum*, 1893, xlviii., and J. E. Harrison (*Prolegomena to Greek Religion*) connect it with τίτανος (gypsum).

According to Harpocration (*s.v.* Ἀπομάττων), the Titans, when they mutilated Dionysus Zagreus (see DIONYSUS), besmeared themselves with gypsum to conceal their identity, as Artemis daubed her face with mud to escape the river-god Alpheus. The custom was practised at Bacchic and purificatory rites (Demosthenes, *De corona*, p. 313) as among savage tribes at the present day. The Titan story is probably an attempt to explain the fact that the Orphic worshippers, when about to tear the sacred animal, daubed themselves with gypsum. L. Weniger, in an article "Feralis exercitus" in *Archiv für Religionsgeschichte* (May 1906, February and March 1907), while regarding the "white colouring" as an original feature, does not accept the derivation of Τιτᾶνες from τίτανος. According to him, Zagreus is the divine hunter, in turn pursued and slain by others mightier than himself, the "snow-clad" (white) giants dwelling on Parnassus. These Titans, whose original is to be found in Pentheus and Lycurgus (for whom see DIONYSUS), had nothing to do with the Titans of Hesiod's *Theogony*. The whole has reference to the winter festival of Dionysus, when the god arrived with his Thyiades (the wind spirits) on the heights of Parnassus, there to be murdered by the Titans, to be buried and come to life again.

The standard work on the subject is M. Mayer, *Die Giganten und Titanen in der antiken Sage und Kunst* (1887).

TITE, SIR WILLIAM (1798–1873), British architect, the son of a Russian merchant, was born in London in February 1798. From 1817 to 1820 he assisted in the rebuilding of the body of the church of St Dunstan-in-the-East, and in compiling its history. Between 1827 and 1828 he built the Scottish church, Regent Square, for Edward Irving, and ten years later collaborated with Charles Robert Cockerell in designing the London & Westminster Bank, Lothbury. The rebuilding of the Royal Exchange, opened in 1844, was, however, Tite's greatest undertaking. He also designed many of the early railway stations in England, including the termini of the London & South-Western railway at Vauxhall (Nine Elms) and Southampton; the terminus at Blackwall, 1840; the citadel station at Carlisle, 1847–1848; the majority of the stations on the Caledonian and Scottish Central railways, including Edinburgh, 1847–1848; Chiswick, 1849; Windsor, 1850; and the stations on the Exeter & Yeovil railway. The stations on the line from Havre to Paris are also his work. Between 1853 and 1854 he planned the Woking Cemetery, and between 1858 and 1859 he built a memorial church in the Byzantine style at Gerrard's Cross, Buckinghamshire. Tite's active work ceased about twenty years before his death. In 1851 he visited Italy after a grave illness. In 1854 he contested Barnstaple unsuccessfully as a Liberal, but in the following year was returned to parliament for Bath, which he represented until his death. He keenly opposed Sir George Gilbert Scott's proposal to build the new foreign office and other government buildings adjacent to the treasury in the Gothic style. In 1869 he was knighted, and in 1870 was made a Companion of the Bath. He died on the 20th of April 1873. Tite had a wide knowledge of English literature and was a good linguist; he was an active citizen and a lover of old books.

TITHES, a form of taxation, secular and ecclesiastical, usually, as the name implies, consisting of one-tenth of a man's property or produce. The tax probably originated in a tribute levied by a conqueror or ruler upon his subjects, and perhaps the custom of dedicating a tenth of the spoils of war to the gods led to the religious extension of the term, the original offerings to deity being "firstfruits."

The custom was almost universal in antiquity; for Greece and Rome see Pauly-Wissowa, *Realencyclopädie*, iv. 2306, 2423; for Babylon, M. Jastrow, *Religion of Babylonia and Assyria*, p. 668; for China, J. Legge, *Chinese Classics*, i. 119; for Egypt, G. Maspero, *Struggle of Nations*, p. 312.[1] The general notion of tax or tribute often prevailed over that of "the tenth" part, so that in Dion Halicarnassus (i. 23) and Philo (*De mutat. nom.* i. 607) ἀπαρχαί and δεκάται are synonymous, and in Mahommedan law the "tithe" is sometimes only $\frac{1}{20}$th or $\frac{1}{40}$th.

Among the early Hebrews the king could exact a tithe from cornfields, vineyards and flocks (1 Sam. viii. 15, 17). On the religious side the oldest laws (*e.g.* Exod. xxxiv. 26) speak of bringing the firstfruits of the land to the house of Yahweh. In the 8th century the term "tithe" was used in Israel of religious dues (Amos iv. 4; Gen. xxviii. 22), and in the 7th century Deuteronomic legislation the word is often found. In Deuteronomy the new point emphasized is not that tithes must be paid, but that they must be consumed at the central, instead of a local, sanctuary (Deut. xii. 6, 11, xiv. 23 sqq.), apparently at the great autumn feast or feast of Tabernacles (*q.v.*).[2] Such a tithe is still nothing more than the old offering of "firstfruits" (*bikkūrīm*) made definite as regards quantity, and it was only natural that as time went on there should be some fixed standard of the due amount of the annual sacred tribute.[3] The establishment of such a standard does not necessarily imply that full payment was exacted; in Gen. xxviii. 22 Jacob vows of his own free will to pay tithes, just as the Arabs used to vow the tithe of the increase of the flock (*schol.* on Ḥārith, *Moall.* l. 69, ed. Arnold). The Arab did not always fulfil his vow, and there was no force to make him do so. A distinction is drawn in Deuteronomy between the ordinary annual tithe, which may not have been a full tenth, and the "whole" or "full tithe," paid once in three

[1] For other instances see Spencer, *De legibus hebraeorum*, lib. iii. cap. 10, § 1. Among the Semites in particular note the tithe paid by the Carthaginians to the Tyrian Melkarth (Diod. xx. 14), and the tithe of frankincense paid in Arabia to the god Sabis (Pliny, *H.N.* xii. 32; and cf. W. R. Smith, *Prophets of Israel*, p. 382 seq.). A tithe of cattle appears in Lydia (Nic. Damasc. *fr.* 24).

[2] Cf. Deut. xxvi. with 1 Sam. i. 21 (Sept.) and Jerome on Ezek. i. 3; and see Wellhausen, *Prolegomena*, p. 94 (Eng. trans., p. 92 seq.).

[3] In Deuteronomy, accordingly, the firstfruits (*bīkkūrīm*) are not mentioned; the tithe takes their place. The word translated "firstfruits" in Deut. (*rēshīth*) is a small gift to the priests, a mere basketful (xviii. 4, xxvi. 2 seq.).

years (Deut. xiv. 28, xxvi. 12), which the legislator directs to be stored at home, and spent in feeding the poor. Amos iv. 4, "Bring your sacrifices every morning and your tithes every three days" (not "years" as E.V.), hardly implies more than that occasions of sacrifice were three times as frequent as tithe-day, and so alludes to the fact that there were by old usage three annual feasts and one annual tithe. A triennial sacrificial tithe is inconceivable when it is remembered that the tithe is only an extension of the firstfruits. The triennial tithe in Deuteronomy seems to be rather an innovation necessary in the interests of the poor, when sacrificial feasts were transferred to the central sanctuary, and ceased to benefit the neighbours of the offerer, who, as stated above, had a prescriptive claim to be considered on such occasions (cf. 1 Sam. xxv. 8 sqq.; Neh. viii. 10; Luke xiv. 13).

The priests of the sanctuaries had of old a share in the sacrificial feasts,[1] and among those who are to share in the triennial tithe Deuteronomy includes the Levites, *i.e.* the priests of the local sanctuaries who had lost their old perquisites by the centralization of worship. In Ezekiel as in the Law of Holiness there is no mention of tithes; he proposes to support all public worship from the proceeds of a general tax (xlv. 13) levied by the prince, the old firstfruits being allotted to the priests. In the Persian period the tithe was converted to the use of the Temple (Mal. iii. 8–10). As Malachi speaks in Deuteronomic phrase of the "whole tithe," the payment to the Levites (now subordinate ministers of the Temple) was perhaps still only triennial; and if even this was difficult to collect, we may be sure that the minor sacrificial tithe had very nearly disappeared. The indifference complained of in Mal. i. was in great part due to the fundamental changes in the religion of Israel, which made private altar gifts and feasts almost meaningless. On the other hand, the provision of regular support for the priests and Levites, the ministers of the public ritual, was now all important, and received special attention from Ezra and Nehemiah (Neh. x. 37 sqq., xiii. 10 sqq.). They effected it by enforcing the new law of the priestly code (Num. xviii. 21 sqq.), in which it is formally laid down that the tithe is a tribute paid to the Levites, who in turn pay a tithe of it to the priests. It is doubtful whether the system ever worked. The plain intention of the priestly code is to allow the old tithe of Deuteronomy to drop; but the harmonistic interpretation of the later scribes was to the effect that two tithes were to be paid every year, and a third tithe, for the poor, on every third year (Tob. i. 7 seq.; Jos. *Ant.* iv. 8, § 22). The last change in the system was the appropriation of the Levitical tithe by the priests, which apparently was effected by John Hyrcanus, though a tradition, glaringly inconsistent with Nehemiah, ascribes it to Ezra, alleging that he deprived the Levites because so few of them were willing to return to Palestine (Mishnah, "Ma'aser Sh." v. 15; "Sota," ix. 10, and Wagenseil's note).[2]

On the whole subject of Hebrew tithes see further G. F. Moore in *Ency. Bib.* col. 5102; A. S. Peake in Hastings's *Dict. of the Bible*, iv. 780; and the works on Hebrew antiquities by H. Nowack and I. Benzinger. (A. J. G.)

Tithes in Law.

Tithes were generally regarded up to the 17th century as existing *jure divino*, and as having been payable to the support of the Church ever since the earliest days of Christianity. History, as Selden showed in his learned and exhaustive treatise (*History of Tithes* 1618), does not bear out this view.[3] In the words of Hallam, "the slow and gradual manner in which parochial churches became independent appears to be of itself a sufficient answer to those who ascribe a great antiquity to the universal payment of tithes."[4]

Long before the 8th century payment of tithes was enjoined by ecclesiastical writers and by councils of the Church; but the earliest authentic example of anything like a law of the state enforcing payment appears to occur in the Capitularies of Charlemagne at the end of the 8th or the beginning of the 9th century. Tithes were by that enactment to be applied to the maintenance of the bishop and clergy, the poor,[5] and the fabric of the Church. In course of time the principle of payment of tithes was extended far beyond its original intention. Thus they became transferable to laymen and saleable like ordinary property, in spite of the injunctions of the third Lateran Council, and they became payable out of sources of income which were not originally tithable. The canon law contains numerous and minute provisions on the subject of tithes. The *Decretum* forbade their alienation to lay proprietors, denounced excommunication against those who refused to pay, and based the right of the Church upon scriptural precedents.[6] The decretals contained provisions as to what was and what was not tithable property, as to those privileged from payment, as to sale or hypothecation to laymen, as to priority over state taxes, &c.[7] Various questions which arose later were settled by Boniface VIII.[8] The Council of Trent enjoined due payment of tithes, and excommunicated those who withheld them.[9]

In England the earliest example of legal recognition of tithes is, according to Selden, a decree of a synod in 786.[10] Other examples before the conquest occur in the *Foedus Ælfredi et Guthruni* and the laws of Athelstan, Edgar and Canute.[11]

A full discussion of their origin and history is to be found in Lord Selborne's *Ancient Facts and Fictions concerning Churches and Tithes* (1888); the *History of the Law of Tithes in England*, by G. Edwardes Jones; and the *Sacred Tenth, Ancient and Modern*, by H. Lansdell (1906). (J. W.)

Tithes in England may be best dealt with in two chronological divisions—tithes under the system existing previously to the Commutation Acts and tithes under the system then introduced.

Before the Commutation Acts.

1. Whether or not, as it is said, before the Council of Lateran in 1180, a man could have given his tithes to any church or monastery that he pleased, at any rate since that time, with the division of dioceses into parishes, they now of common right belong to the church within whose parish they arise, although by prescription they may belong elsewhere. The general rule was said to be that all lands within a parish are subject to tithes, and a layman was not allowed to prescribe generally that his lands were exempt; but he had to show a special exemption, and no length of possession was regarded in law in view of the maxim *nullum tempus occurrit ecclesiae*, although equity did take account of it. The tithes in places extra-parochial, *e.g.* forest lands, belong to the Crown, although by canon law they were to be disposed of by the bishop; but by custom a parson or vicar might be entitled to them. The tithes of tithable cattle pasturing in any waste or common ground, whereof the parish is not certainly known, were made payable to the parson of the parish where the cattle dwell by a statute of Edward VI.

Tithes were classified according to their nature as praedial, or

[1] The tithe offered to Yahweh may have originally been consumed—in whole or in representative part—on the altar, but in the rituals preserved to us the offering is symbolical, the deity ceding his tithe to the priest, so that from quite early times the tithe helped to support the priesthood who like the poor had a customary share (guest-right) in the feasts.

[2] A cattle tithe is demanded in Lev. xxvii. 32, and spoken of in 2 Chron. xxxi. 6. It is doubtful if this was ever acknowledged in practice. See Kuenen, *Godsdienst*, ii. 269 seq., and Wellhausen, *Prolegomena*, v. 1, § 2 (Eng. trans., p. 155 seq.), who argue that the passage in Leviticus is a later addition. The tendency of the Pharisees was to pay tithe on everything, and to make a self-righteous boast of this (Matt. xxiii. 23; Luke xviii. 12). The Mishna (Ma'aseroth i. 1) says "everything that is eaten and is watched over and grows out of the ground is liable to tithe."

[3] It was his denial of the divine right of tithes that brought down the wrath of the Star Chamber upon the author. He was forced to retract an opinion too liberal for the time. (See SELDEN.)

[9] Sess. xxv. 12.

[10] C. viii. § 2.

[11] The grant said to have been made by Æthelwulf in 855, to which the general payment of tithes in England has been commonly traced, appears not to rest on satisfactory evidence.

arising immediately from the ground, *e.g.* grain of all sorts, hay, wood and the like; mixed, or arising from things immediately nourished by the ground, *e.g.* colts, lambs, eggs and the like; or personal, namely, of profits arising from the honest labour and industry of man, and being the tenth part of the clear gain, *e.g.* fishing, mills and the like; or according to value, as great, *e.g.* corn, hay and wood; or little, which embraced all others. Of common right tithes were only payable of such things as yield a yearly increase by the act of God, and generally only once a year. They were not payable of the following, except by custom: things of the substance of the earth, such as coals, minerals, turf and the like; things *ferae naturae*, such as fish, deer and the like; things tame, such as fowls, hounds or fish kept for pleasure or curiosity; barren land, until it is converted into arable or meadow land, and has been so for seven years; forest land, if in the hands of the king or his lessee, unless disafforested; a park which is disparked; or glebe land in the hands of the parson or vicar, which was mutually exempted from payment by the one to the other, but not if in the hands of the vicar's lessee. Another exception to the incidence of tithes were abbey lands. These were exempted generally by Pope Pascal II. while in the hands of their owners, but the privilege was restricted by Pope Adrian IV. in the time of Henry II. to the three religious orders of Cistercians, Templars and Hospitallers (to whom the Templars' lands were given on their dissolution in 17 Edw. II.), to which Pope Innocent III. added the Praemonstratenses. The Council of the Lateran in 1215 further restricted this exemption to lands of which these orders were in possession before that council. A custom by the religious to obtain exemption for lands let to their tenants by means of bulls from the pope was put an end to by a statute of Henry IV. making the acquisition or use of such bulls henceforward a *praemunire*. When the religious houses were dissolved by Henry VIII., in the case of the greater abbeys and priories the exemptions from payment of tithes enjoyed by them passed to the Crown or the persons to whom the Crown assigned them, and thus any lands which might have been thus exempted, whether they had been actually so or not, were presumed to be exempt; and a further exemption was created by parsonages coming into the same hands as tithable lands, which lasted so long as such union continued.

A further exemption from tithes was given by an act of 1832 (2 & 3 Will. IV. c. 100), which fixed a period of prescription against claims of tithe by laymen or corporations aggregate, of thirty years during which there had been no payment of tithes or a *modus* or composition had existed, in the absence of contrary evidence, and in any case of sixty years; and against corporations sole, of sixty years or the tenures of two successive incumbents and three years after the entry of a third. The tithes which came into lay hands by the dissolution of the religious houses and the previous suppression of alien priories by Henry V. became in all respects incorporeal freehold property. Under the Limitation Act of 1833 twenty years of adverse possession of an estate in tithes gave a good title, except as against spiritual or eleemosynary corporations sole whose right to recover tithes was limited, if at all, to a period of two incumbencies and six years afterwards, or sixty years (s. 29).

Tithes were generally recovered by a writ against the owner of the tithable property usually brought in the ecclesiastical courts (questions of title to tithes being reserved to the temporal courts), the jurisdiction of which in this respect was confirmed by the statutes *Circumspecte agatis* (13 Edw. I.), *Articuli cleri* (9 Edw. II.), and others of Henry VIII. and Edward VI., and was enforced by ecclesiastical censures and the writ *De excommunicato capiendo*; and an act 2 & 3 Edw. VI. made any person refusing to set out tithes liable to pay double the value in the ecclesiastical court or treble in a common law court. Tithes of small amount or due from Quakers could be recovered by summary proceedings before justices under statutes ranging from William III. to Victoria. Tithes could also be sued for in equity, especially the equity side of the exchequer. A custom also sprang up, and was common at the time of the Commutation Acts, for a tithe-owner to accept a fixed sum of money or fixed quantity of the goods tithable in place of the actual tithes, known as a *modus decimandi*, whether in respect of a whole parish or only of particular lands within it; and this could be sued for in the ecclesiastical courts. Tithe-payers could also file bills in equity to establish a *modus* against a tithe-owner. In the City of London there were customary tithes; in other towns and places there were compositions for tithes which were confirmed by local acts of parliament; and according to a return presented to the House of Commons in 1831, there were passed between 1757 and 1830 no less than 2000 local acts containing clauses for the commutation of tithes. Enclosure Acts often gave a portion of the lands enclosed to the spiritual or lay rector and exempted the rest from tithes; and in other local acts a corn rent or yearly money payment was substituted for tithes. Except, however, where made under parliamentary authority, no composition for tithes, although made between the landowner and the parson or vicar with the consent of the patron and ordinary, bound a succeeding incumbent, the statute 13 Eliz. c. 10 prohibiting any parson or vicar from making any conveyance of (*inter alia*) tithes, being parcel of the possessions of their churches, to any persons, except leases for twenty-one years or three lives.

After the Commutation Acts.

2. The principle of the Tithe Commutation Acts (1836–1860) is to make permanent and general the system which had been only partial or temporary (in most cases), and to "substitute a corn rent (known as a tithe rent charge), permanent in quantity and payable in money, but fluctuating in value, for all tithes, whether payable under a *modus* or composition or not, which may have heretofore belonged either to ecclesiastical or lay persons" (Phillimore, *Eccles. Law*, ii. 1161).

Commissioners (now the board of agriculture) are appointed to execute the acts; a rent charge on all lands liable to tithes at the time of the passing of the first act is substituted for those tithes, of which the gross amount is ascertained either by voluntary parochial agreement, or, failing that, by compulsory award confirmed by the commissioners; and the value of the tithes is fixed in the latter case by their average value in the particular parish during the seven years preceding Christmas 1835, without deduction for parochial or county and other rates, charges and assessments falling on tithes, the rent charge being liable to all the charges to which tithes were liable. The rent charge is apportioned on all the lands liable in the parish, and such apportionment may be altered or a new one made: and the value of the rent charge is fixed at the value (at the time of confirmation of the apportionment) of the number of imperial bushels and decimal parts of bushels of wheat, barley and oats as the same would have purchased at the prices so ascertained by the advertisement (of prices of corn) to be published immediately after the passing of the act 6 & 7 Will. IV. c. 71, in case one-third part of such rent charge had been invested in the purchase of wheat, one-third part in the purchase of barley, and the remaining third part in the purchase of oats; and the respective quantities of wheat, barley and oats so ascertained shall be stated in the draft of every apportionment. The price at which the conversion from money into corn is to be made at the time of confirmation of such apportionment, according to the provisions of the said act, are 7s. 0¼d. for a bushel of wheat, 3s. 11½d. for a bushel of barley and 2s. 9d. for a bushel of oats (7 Will. IV. and 1 Vict. c. 69); the average price of the bushel of each grain is now computed by substituting for the "advertisement" above the statement of the septennial average price of the imperial bushel of British corn made under the Corn Returns Act 1882; and thus the value of the statutory amount of corn is now fixed for each year at the beginning thereof at the average price of the three components of corn for the previous seven years. The extent of the depreciation in value of tithe may be gathered from the fact that for 1902 the price of the wheat bushel is thus fixed at 3s. 5¼d., that of the barley bushel at 3s. 0½d. and that of the oats bushel at 2s. 1d.

As already indicated above, certain lands are exempt from payment of tithes while in the occupation of their owners, either by reason of their having been parcel of the possessions of any privileged order, or by reason of their being of the tenure of ancient demesne and exempt whilst in the tenure, occupation or manurance of the Crown, its tenants, farmers and lessees or under-tenants, although they are subject to tithes when aliened or occupied by subjects not being such; and in these and in all such cases, with the consent of such owners, a fixed rent charge may be substituted for any contingent rent charge imposed on them (2 & 3 Vict. c. 62; 3 & 4 Vict. c. 15, now repealed except as to tithes not commuted). In certain cases where commutation of tithes for rent charge in the ordinary way was impracticable, *e.g.* in the case of Lammas lands or in the case of common lands, power was given to charge a fixed sum or rate per head of the cattle there pasturing, with an exception in the case of Lammas lands which for seven years before Christmas 1835 had paid no tithe; and also to fix a rent charge in respect of tithes of common appurtenant on the allotment made in respect of the lands to which such right of common attached (2 & 3 Vict. c. 62; 3 & 4 Vict. c. 15; 9 & 10 Vict. c. 73). By an act of 1860 (23 & 24 Vict. c. 93) a gross rent charge can be substituted for a commutation of tithes on common rights at a fixed sum per head; a gross rent charge made payable in respect of the tithes of a gated or stinted pasture rated to the relief of the poor may be apportioned thereupon and enforced in the method prescribed by the other Tithe Acts; a rent charge on commons may be commuted for part of the land or redeemed, if the landowners and persons liable for tithe so agree; and upon enclosure, a rate per head may be converted into a rent charge on the lands allotted. These rent charges are not subject to the Tithe Act of 1891. This act of 1860 also gave power to convert the corn rents established under local acts into rent charges.

In the case of hop-grounds, orchards, fruit-plantations and gardens power was given to the commissioners to value them separately, according to the average rate of composition for the seven years preceding Christmas 1835, and to fix an ordinary and an extraordinary charge for tithes thereof, the former for such lands going out of cultivation, the latter for such as were thereafter newly cultivated: lands subject to the latter were exempted during their first years of cultivation; and such lands were only subject to it if situated in a parish in which an extraordinary charge had been distinguished at the time of commutation (6 & 7 Will. IV. c. 71; 2 & 3 Vict. c. 62; 3 & 4 Vict. c. 15; 23 & 24 Vict. c. 93; 36 & 37 Vict. c. 42). In 1886, however, it was enacted that no such extraordinary charge shall be levied on any such grounds so newly cultivated in future; the capital value of the existing charges was assessed, and the payment of interest thereon was made a rent charge on the land payable in priority to all other charges until its redemption, and recoverable in the same way as ordinary rent charge and exempt from all rates, charges and assessments: the charge was redeemable at the capital value, and, saving existing contracts, it was as between landlord and tenant payable by the landlord, any agreement to the contrary notwithstanding; and it is not subject to the Tithe Act of 1891. Under the act of 1840 (3 & 4 Vict. c. 15) gardens and lawns and the like, of small size, could be exempted from tithes.

Besides the tithes dealt with by local acts as already mentioned, certain other kinds of tithes are outside the scope of the Commutation Acts, namely, tithes of fish and fishing, personal tithes other than tithes of mills, and mineral tithes, unless the landowners and tithe-owners consent to make a parochial agreement for commutation before the confirmation of an apportionment after a compulsory award in such parish. As already seen, fish being *ferae naturae* are only tithable by custom; but fish taken in the sea by the custom of the realm are tithable as a personal tithe, *i.e.* in some small sum for the net profits of the fishing, and customs for payment in kind have been upheld by the courts. Personal tithes, if not commuted or otherwise still payable, are regulated by a statute of Edward VI., which (except in the case of fishing and tithes for houses in cities and towns, which may be due by custom) restricted them to such persons exercising merchandises, bargaining and selling clothing, handicraft or other art or faculty in such places as had for forty years previously so used to do. Personal tithes are now rare, except of fish caught at sea, when they are payable to the church where the taker hears divine service and receives the sacraments. Tithes on houses or customary payments in lieu of tithes have, by local acts, in some cases been turned into church rates. Statutory provision is also made for allowing tithes and tithe rent charge to be exchanged for land, and for the redemption of rent charges made under the acts, and also of corn rents under the local acts. Tithe rent charge may also be merged in the land tithable, with the consent of the tithe commissioners and the landowner, by the legal and equitable owners of tithes in fee simple or fee tail, or persons having power to appoint the fee simple in tithes, or owners of glebes, or owners of lands and tithes settled to the same uses.

Tithe rent charge under these acts is subject to the same liabilities and incidents as tithes, such as parliamentary, parochial, county and other rates, especially the poor rate and highway rate; but the owner of tithe rent charge attached to a benefice has been exempted by an act of 1899 from payment of half the amount of any rate which he would be liable to pay under the Agricultural Rates Act 1896, the other half being borne by the Inland Revenue Commissioners. The limitation of time for recovery of tithes or estates in tithes, whether between rival claimants to tithes or tithe-owners or tithe-payers, if belonging to lay individuals or lay or spiritual corporations aggregate, is a period of twelve years, as in the case of other real property (37 & 38 Vict. c. 57); and in the case of spiritual corporations sole the period of limitation of actions, if any, is governed by the Limitation Act 1833, s. 29, already quoted, the act 2 & 3 Will. IV. c. 100 being held only to apply to demands of tithe in kind.

The method of recovering rent charge under the Commutation Acts was distraint where the rent charge is in arrear for twenty-one days after the half-yearly days of payment, and entry and possession with power of letting if it is in arrear for forty days, and arrears for two years are so recoverable: this power of distress and entry extends to all lands occupied by the occupier of the land whose tithe is in arrear as owner or under the same landlord; but no action lies against the owner or occupier of the land personally. If a tenant quits leaving tithe unpaid, the landlord may pay it and recover it from him. The tithe-owner cannot recover damages from the tithe-payer for not cultivating the land. Special provision is made for the recovery of the rent charge in railway lands.

The act of 1891, has, however, altered this method of recovering tithes, and substituted another intended to shift the burden of responsibility from the occupier to the landowner, by making the latter directly and solely responsible, but giving the remedy against the land. The landowner is made liable to pay the rent charge in spite of any contract to the contrary between him and the occupier; the rent charge if in arrear for three months is recoverable by an order of the county court, whatever its amount may be: if the land is occupied by the owner, the order is executed by the same means as those prescribed in the Tithe Acts; but if it is not, then by a receiver being appointed for the rents and profits of the land: neither landlord nor occupier is personally liable for payment; and appeal lies to the High Court on points of law; and a remission of rent charge may be claimed when its amount exceeds two-thirds of the annual value of the land. The act does not apply to the particular kinds of rent charges mentioned above.

The Tithe Acts do not apply to the city of London, which has always had its own peculiar customary payment regulated by episcopal constitutions of 13 Hen. III. and 13 Ric. II. and statutes of Henry VIII., confirming a decree of the privy council, under which the rate of tithes was fixed at 16½d. for every 10s. rent, and at 2s. 9d. for every 20s. rent of houses, shops and the like by the year. Provision was made by statute after the fire of London for certain annual tithes to be paid in parishes whose churches had been destroyed, and there have been local acts from time to time with regard to particular parishes therein.

(G. G. P.*)

TITHING (for tithe, tenth; Lat. *decuma*), formerly a unit of local administration in England. In some districts the men who were bound to be in frankpledge (*q.v.*) were grouped in associations of ten, twelve or more individuals called tithings. When a person who was accused of any crime was not forthcoming, inquiry was made whether he was in frankpledge; if he were not, and had no right of exemption, the township was amerced, but if he were in a tithing, then it was upon the tithing that the amercement fell. South of the Thames the tithings were districts normally identical with the township which discharged the duties of the frankpledge. Some townships, however, contained more than one tithing. There are also indications that in the ancient kingdom of Mercia the tithing was originally a district and not a mere association of persons; but in Northumbria it is doubtful whether the system of frankpledge and tithing, either personal or territorial, was ever established. If, as seems likely, the territorial tithing is older than the personal, each territorial hundred (*q.v.*) was probably divided into ten tithings.

TITHONUS, in Greek legend, according to Homer son of Laomedon, king of Troy and husband of Eos (the morning). In the Homeric *Hymn to Aphrodite*, Eos is said to have carried him off because of his great beauty. She entreated Zeus that he might live for ever; this was granted, but she forgot to ask for immortal youth for him. He became a hideous old man; Eos then shut him up in a chamber; his voice "flowed on unceasingly," but his limbs were helpless. A later development is the change of Tithonus into a grasshopper, after Eos had been obliged to wrap him like a child in swaddling-clothes and to put him to sleep in a kind of cradle. He was probably associated with the Trojan royal house, since the inhabitants of the original home of the legend (probably central or northern Greece) looked upon the East, the land of the morning, as the home of Eos. In some versions she is said to have carried him away still farther East, to the land of Ethiopia near the ocean streams; this is euhemeristically referred by Diodorus Siculus to an expedition undertaken against Ethiopia by Tithonus, son of Laomedon.

It is probable that Tithonus was originally a sun-god; the scholiast on *Iliad*, xi. 5, who calls him Titan, identifies him with Apollo, and there are many points of resemblance between him and the sun-god Helios. The story is generally regarded as an allegorical representation of the fresh morning sun dried up by the heat of the advancing day. Possibly it is merely intended as a warning to mortals not to unite with immortals, lest they incur the jealousy and wrath of the gods.

See Homer, *Iliad*, xi. 1, xix. 237; *Hymn in Venerem*, 219 sqq., with Allen and Sikes's notes; Apollodorus iii. 12, 4; Diod. Siculus iv. 75; Horace, *Odes*, ii. 16, 30; Propertius iii. 10 (18); O. Gruppe, *Griechische Mythologie*, i. 313, n. 16, who attributes a Milesian origin to the story; articles "Eos" by Rapp in Roscher's *Lexikon der Mythologie* and by Escher in Pauly-Wissowa's *Realencyclopädie*.

TITIAN (*c.* 1477–1576). Tiziano Vecellio, or Vecelli, one of the greatest painters of the world, and in especial the typical representative of the Venetian school, was commonly called during his lifetime "Da Cadore," from the place of his birth, and has also been designated "Il Divino." The country of Cadore, in the Friuli, barren and poor, is watered by the Piave torrent poured forth from the Carnic Alps, and is at no great distance from Tirol. Titian, therefore, was not in any sense a Venetian of the lagoons and Adriatic, but was native to a country, and a range of association, perception and observation, of a directly different kind. Venice conquered Friuli at a date not very remote from the birth of Titian; and Cadore, having to choose between Venetian and imperial allegiance, declared for the former. Approaching the castle of Cadore from the village Sotto Castello, one passes on the right a cottage of humble pretensions, inscribed as Titian's birthplace; the precise locality is named Arsenale. The near mountain—all this range of hills being of dolomite formation—is called Marmarolo. At the neighbouring village of Valle was fought in Titian's lifetime the battle of Cadore, a Venetian victory which he recorded in a painting. In the 12th century the count of Camino became count also of Cadore. He was called Guecello; and this name descended in 1321 to the podestà (or mayor) of Cadore, of the same stock to which the painter belonged. Titian, one of a family of four, and son of Gregorio Vecelli, a distinguished councillor and soldier, and of his wife Lucia, was born in 1477. So it has very generally been stated; but of late years a subsequent date, 1489–1490, has been suggested, so as to make Titian, at the time of his death, not so singularly long-lived a man. As to this interesting point one should remember that Vasari in one passage (at variance with some others) says that Titian was born in 1480; while Titian himself, writing to Philip II. in 1571, professed to be ninety-five years old.

It used to be said that Titian, when a child, painted upon the wall of the Casa Sampieri, with flower-juice, a Madonna and Infant with a boy-angel; but modern connoisseurs say that the picture is a common work, of a date later than Titian's decease. He was still a child when sent by his parents to Venice, to an uncle's house. There he was placed under an art teacher, who may perhaps have been Sebastiano Zuccato, a mosaicist and painter now forgotten. He next became a pupil of Gentile Bellini, whom he left after a while, because the master considered him too offhand in work. Here he had the opportunity of studying many fine antiques. His last instructor was Giovanni Bellini; but Titian was not altogether satisfied with his tutoring. The youth was a contemporary of Giorgione and Palma Vecchio; when his period of pupilage expired, he is surmised to have entered into a sort of partnership with Giorgione. A fresco of "Hercules" on the Morosini Palace is said to have been one of his earliest works; others were the "Virgin and Child," in the Vienna Belvedere, and the "Visitation of Mary and Elizabeth" (from the convent of S. Andrea), now in the Venetian Academy. In 1507–1508 Giorgione was commissioned by the state to execute frescoes on the re-erected Fondaco de' Tedeschi. Titian and Morto da Feltre worked along with him, and some fragments of Titian's paintings, which are reputed to have surpassed Giorgione's, are still discernible. According to one account, Giorgione was nettled at this superiority, and denied Titian admittance to his house thenceforth. Stories of jealousies between painters are rife in all regions, and in none more than in the Venetian—various statements of this kind applying to Titian himself. One should neither accept nor reject them uninquiringly; counter-evidence of some weight can be cited for Vecelli's vindication in relation to Moroni, Correggio, Lotto and Coello. Towards 1511, after the cessation of the League of Cambrai—which had endeavoured to shatter the power of the Venetian republic, and had at any rate succeeded in clipping the wings of the lion of St Mark—Vecelli went to Padua, and painted in the Scuola di S. Antonio a series of frescoes, which continue to be an object of high curiosity to the students of his genius, although they cannot be matched against his finest achievements in oil painting. Another fresco, dated 1523, is "St Christopher carrying the Infant Christ," at the foot of the doge's steps in the ducal palace of Venice. From Padua Titian in 1512 returned to Venice; and in 1513 he obtained a broker's patent in the Fondaco de' Tedeschi (state-warehouse for the German merchants), termed "La Sanseria" or "Senseria" (a privilege much coveted by rising or risen artists), and became superintendent of the government works, being especially charged to complete the paintings left unfinished by Giovanni Bellini in the hall of the great council in the ducal palace. He set up an atelier on the Grand Canal, at S. Samuele—the precise site being now unknown. It was not until 1516, upon the death of Bellini, that he came into actual enjoyment of his patent, at the same date an arrangement for painting was entered into with Titian alone, to the exclusion of other artists who had heretofore been associated with him. The patent yielded him a good annuity—120 crowns—and exempted him from certain taxes—he being bound in return to paint likenesses of the successive doges of his time at the fixed price of eight crowns each. The actual number which he executed was five. Titian, it may be well to note as a landmark in this all but centenarian life of incessant artistic labour and productiveness, was now (if we adopt 1477 as the birth-date) in the fortieth year of his age. The same year, 1516, witnessed his first journey to Ferrara. Two years later was produced, for the high altar of the church of the Frari, one of his most world-renowned masterpieces, the "Assumption of the Madonna," now in the Venetian Academy. It excited a vast sensation, being indeed the most extraordinary piece of colourist execution on a great scale which Italy had yet seen. The signoria took note of the facts and did not fail to observe that Titian was neglecting his work in the hall of the great council.

Vecelli was now at the height of his fame; and towards 1521, following the production of a figure of "St Sebastian" for the papal legate in Brescia (a work of which there are numerous replicas), purchasers became extremely urgent for his productions. In 1525, after some irregular living and a consequent fever, he married a lady of whom only the Christian name, Cecilia, has come down to us; he hereby legitimized their first child, Pomponio, and two (or perhaps three) others followed. Towards 1526 he became acquainted, and soon exceedingly intimate, with Pietro Aretino, the literary bravo, of influence and audacity hitherto unexampled, who figures so strangely in the chronicles of the time. Titian sent a portrait of him to Gonzaga, duke of Mantua. A great affliction befell him in August 1530 in the death of his wife. He then, with his three children—one of them being the infant Lavinia, whose birth had been fatal to the mother—removed to a new home and got his sister Orsa to come from Cadore and take charge of the household. The mansion, difficult now to find, is in the Biri Grande, then a fashionable suburb, being in the extreme end of Venice, on the sea, with beautiful gardens and a look-out towards Murano. In 1532 he painted in Bologna a portrait of the emperor Charles V., and was created a count palatine and knight of the Golden Spur, his children also being made nobles of the empire—for a painter, honours of an unexampled kind.

The Venetian government, dissatisfied at Titian's neglect of the work for the ducal palace, ordered him in 1538 to refund the money which he had received for time unemployed; and Pordenone, his formidable rival of recent years, was installed in his place. At the end of a year, however, Pordenone died; and Titian, who had meanwhile applied himself diligently to painting in the hall the battle of Cadore, was reinstated. This great picture, which was burned with several others in 1577, represented in life-size the moment at which the Venetian captain, D'Alviano, fronted the enemy, with horses and men crashing down into the stream. Fontana's engraving, and a sketch by Titian himself in the gallery of the Uffizi in Florence, record the energetic composition. As a matter of professional and worldly success, his position from about this time may be regarded as higher than that of any other painter known to history, except Raphael, Michelangelo, and at a later date Rubens. In 1540 he received a pension from D'Avalos, marquis del Vasto, and an annuity of 200 crowns (which was afterwards doubled) from Charles V. on the treasury of Milan. Another source of profit—for he was always sufficiently keen after money—was a contract, obtained in 1542, for supplying grain to Cadore, which he visited with regularity almost every year, and where he was both generous and influential. This reminds us of Shakespeare and his relations to his birthplace, Stratford-on-Avon; and indeed the great Venetian and the still greater Englishman had something akin in the essentially *natural* tone of their inspiration and performance, and in the personal tendency of each to look after practical success and "the main chance" rather than to work out aspirations and pursue ideals. Titian had a favourite villa on the neighbouring Manza Hill, from which (it may be inferred) he made his chief observations of landscape form and effect. The so-called "Titian's mill," constantly discernible in his studies, is at Collontola, near Belluno (see R. F. Heath's *Life of Titian*, p. 5). A visit was paid to Rome in 1546, when he obtained the freedom of the city, his immediate predecessor in that honour having been Michelangelo in 1537. He could at the same time have succeeded the painter Fra Sebastiano in his lucrative office of the piombo, and he made no scruple of becoming a friar for the purpose; but this project lapsed through his being summoned away from Venice in 1547 to paint Charles V. and others, in Augsburg. He was there again in 1550, and executed the portrait of Philip II., which was sent to England and proved a potent auxiliary in the suit of the prince for the hand of Queen Mary. In the preceding year Vecelli had affianced his daughter Lavinia, the beautiful girl whom he loved deeply and painted various times, to Cornelio Sarcinelli of Serravalle; she had succeeded her aunt Orsa, now deceased, as the manager of the household, which, with the lordly income that Titian made by this time, was placed on a corresponding footing. The marriage took place in 1554. She died in childbirth in 1560. The years 1551 and 1552 were among those in which Titian worked least assiduously—a circumstance which need excite no surprise in the case of a man aged about seventy-five. He was at the Council of Trent towards 1555, of which his admirable picture or finished sketch in the Louvre bears record. He was never in Spain, notwithstanding the many statements which have been made in the affirmative. Titian's friend Aretino died suddenly in 1556, and another close intimate, the sculptor and architect Jacopo Sansovino, in 1570. With his European fame, and many sources of wealth, Vecelli is the last man one would suppose to have been under the necessity of writing querulous and dunning letters for payment, especially when the defaulter addressed was lord of Spain and of the American Indies; yet he had constantly to complain that his pictures remained unpaid for and his pensions in arrear, and in the very year of his death (February) he recites the many pictures which he had sent within the preceding twenty years without receiving their price. In fact, there is ground for thinking that all his pensions and privileges, large as they were nominally, brought in but precarious returns. It has been pointed out that in the summer of 1566 (when he was elected into the Florentine Academy) he made an official declaration of his income, and put down the various items apparently below their value, not naming at all his salary or pensions. Possibly there was but too much reason for the omission.

In September 1565 Titian went to Cadore and designed the decorations for the church at Pieve, partly executed by his pupils. One of these is a Transfiguration, another an Annunciation (now in S. Salvatore, Venice), inscribed "Titianus fecit," by way of protest (it is said) against the disparagement of some persons who cavilled at the veteran's failing handicraft. He continued to accept commissions to the last. He had selected as the place for his burial the chapel of the Crucifix in the church of the Frari; and, in return for a grave, he offered the Franciscans a picture of the "Pietà," representing himself and his son Orazio before the Saviour, another figure in the composition being a sibyl. This work he nearly finished; but some differences arose regarding it, and he then settled to be interred in his native Pieve. Titian was ninety-nine years of age (more or less) when the plague,[1] which was then raging in Venice, seized him, and carried him off on the 27th of August 1576. He was buried in the church of the Frari, as at first intended, and his "Pietà" was finished by Palma Giovane. He lies near his own famous painting, the "Madonna di Casa Pesaro." No memorial marked his grave, until by Austrian command Canova executed the monument so well known to sightseers. Immediately after Titian's own death, his son and pictorial assistant Orazio died of the same epidemic. His sumptuous mansion was plundered during the plague by thieves, who prowled about, scarce controlled.

Titian was a man of correct features and handsome person, with an uncommon air of penetrating observation and self-possessed composure—a Venetian presence worthy to pair with any of those "most potent, grave and reverend signors" whom his pencil has transmitted to posterity. He was highly distinguished, courteous and winning in society, personally unassuming, and a fine speaker, enjoying (as is said by Vasari, who saw him in the spring of 1566) health and prosperity unequalled. The numerous heads currently named Titian's Mistress might dispose us to regard the painter as a man of more than usually relaxed morals; the fact is, however, that these titles are mere fancy-names, and no inference one way or the other can be drawn from them. He gave splendid entertainments at times; and it is related that, when Henry III. of France passed through Venice on his way from Poland to take the French throne, he called on Titian with a train of nobles, and the painter presented him as a gift with all the pictures of which he inquired the price. He was not a man of universal genius or varied faculty and accomplishment, like Leonardo da Vinci and Michelangelo; his one great and supreme endowment was that of painting.

Ever since Titian rose into celebrity the general verdict has been that he is the greatest of painters, considered technically. In the first place neither the method of fresco painting nor work of the colossal scale to which fresco painting ministers is here in question. Titian's province is that of oil painting, and of painting on a scale which, though often large and grand, is not colossal either in dimension or in inspiration. Titian may properly be regarded as the greatest manipulator of paint in relation to colour, tone, luminosity, richness, texture, surface and harmony, and with a view to the production of a pictorial whole conveying to the eye a true, dignified and beautiful impression of its general subject-matter and of the objects of sense which form its constituent parts. In this sense Titian has never been deposed from his sovereignty in painting, nor can one forecast the time in which he will be deposed. For the complex of qualities which we sum up in the words colour, handling and general force and harmony of effect, he stands unmatched, although in particular items of forcible or impressive execution—not to speak of creative invention—some painters, one in one respect and another in another, may indisputably be preferred to him. He carried to its acme that great colourist conception of the Venetian school of which the first masterpieces are due to the two Bellini, to Carpaccio; and, with more fully developed suavity of manner, to Giorgione. Pre-eminent inventive power or sublimity

[1] Out of a total population of 190,000 there perished at this time 50,000.

of intellect he never evinced. Even in energy of action and more especially in majesty or affluence of composition the palm is not his; it is (so far as concerns the Venetian school) assignable to Tintoretto. Titian is a painter who by wondrous magic of genius and of art satisfies the eye, and through the eye the feelings—sometimes the mind.

Titian's pictures abound with memories of his home-country and of the region which led from the hill-summits of Cadore to the queen-city of the Adriatic. He was almost the first painter to exhibit an appreciation of mountains, mainly those of a turreted type, exemplified in the Dolomites. Indeed he gave to landscape generally a new and original vitality, expressing the quality of the objects of nature and their control over the sentiments and imagination with a force that had never before been approached. The earliest Italian picture expressly designated as "landscape" was one which Vecelli sent in 1552 to Philip II. His productive faculty was immense, even when we allow for the abnormal length of his professional career. In Italy, England and elsewhere more than a thousand pictures figure as Titian's; of these about 250 may be regarded as dubious or spurious. There are, for instance, 6 pictures in the National Gallery, London, 18 in the Louvre, 16 in the Pitti, 18 in the Uffizi, 7 in the Naples Museum, 8 in the Venetian Academy (besides the series in the private meeting-hall) and 41 in the Madrid Museum. In the National Gallery 3 other works used to be assigned to Titian, but are now regarded rather as examples of his school.

Naturally a good deal of attention has been given by artists, connoisseurs and experts to probing the secret of how Titian managed to obtain such astonishing results in colour and surface. The upshot of this research is but meagre; the secret seems to be not so much one of workmanship as of faculty. His figures were put in with the brush dipped in a brown solution, and then altered and worked up as his intention developed. The later pictures were touched off rapidly, telling well from a distant view. He himself averred that after his visit to Rome in 1546 he had greatly improved in art; and in his very last days he said—certainly with the modesty of genius, perhaps also with some of the tenacity of old age—that he was then beginning to understand what painting meant. In his earlier pictures the gamut of colour rests mainly upon red and green, in the later ones upon deep yellow and blue. The pigments which he used were nothing unusual; indeed they were both few and common. Palma Giovane records that Vecelli would set pictures aside for months, and afterwards, examining them with a stern countenance, as if they were his mortal enemies, would set to work upon them like a man possessed; also that he kept many pictures in progress at the same time, turning from one to the other, and that in his final operations he worked far more with finger than with brush. It has been said, and probably with truth, that he tried to emulate Palma Vecchio in softness as well as Giorgione in richness. Michelangelo's verdict after inspecting the picture of "Danae in the Rain of Gold," executed in 1546, has often been quoted. He said, "That man would have had no equal if art had done as much for him as nature." He was thinking principally of severity and majesty of draughtsmanship, for he added, "Pity that in Venice they don't learn how to draw well." As a draughtsman of the human figure Titian was not only competent but good and fine, and he is reported to have studied anatomy deeply; but one can easily understand that he fell not a little short of the standard of Michelangelo, and even of other leading Florentines. He was wont to paint in a nude figure with Venetian red, supplemented by a little lake in the contour and towards the extremities. He observed that a colourist ought to manipulate white, black and red, and that the carnations cannot be done in a first painting, but by replicating various tints and mingling the colours. He distanced all predecessors in the study of colour as applied to draperies—working on the principle (in which Giorgione may perhaps have forestalled him) that red comes forward to the eye, yellow retains the rays of light, and blue assimilates to shadow. In his subject-pictures the figures are not very numerous, and the attitudes are mostly reserved; even in bacchanals or battles the athletic display has more of facility than of furor. His architectural scenes were sometimes executed by other persons, especially the Rosas of Brescia. The glow of late afternoon, or the passionate ardour of early sundown, was much affected by Titian in the lighting of his pictures. Generally it may be said that he took great pains in completing his works, and pains also in concealing the traces of labour. He appears to have had little liking for teaching, partly from distaste of the trouble, and partly (if we are to believe biographers) from jealousy. He was quite willing, however, to turn to some account the work of his scholars: it is related that on going out of doors he would leave his studio open, so that the pupils had a clandestine opportunity of copying his works, and if the copies proved of saleable quality he would buy them cheap, touch them up, and resell them.

Titian's family relations appear to have been happy, except as regards his eldest son, Pomponio. This youth, at the age of six, was launched upon the ecclesiastical career; but he proved wasteful and worthless, and Titian at last got so disgusted with him that he obtained the transfer to a nephew of a benefice destined for Pomponio. The fortune which he left was, after his decease, squandered by the tonsured prodigal. The other son, Orazio, born towards 1528, who (as we have seen) assisted Titian professionally, became a portrait-painter of mark—some of his likenesses, almost comparable with Titian's own, being often confounded with his by owners and connoisseurs. He executed an important picture in the hall of the great council, destroyed by fire. He gave to alchemy some of the time which might have been bestowed upon painting. Several other artists of the Vecelli family followed, in the wake of Titian. Francesco Vecelli, his elder brother, was introduced to painting by Titian (it is said at the age of twelve, but chronology will hardly admit of this), and painted in the church of S. Vito in Cadore a picture of the titular saint armed. This was a noteworthy performance, of which Titian (the usual story) became jealous; so Francesco was diverted from painting to soldiering, and afterwards to mercantile life. Marco Vecelli, called Marco di Tiziano, Titian's nephew, born in 1545, was constantly with the master in his old age, and learned his methods of work. He has left some able productions—in the ducal palace, the "Meeting of Charles V. and Clement VII. in 1529"; in S. Giacomo di Rialto, an "Annunciation"; in SS. Giovani e Paolo, "Christ Fulminant." A son of Marco, named Tiziano (or Tizianello), painted early in the 17th century. From a different branch of the family came Fabrizio di Ettore, a painter who died in 1580. His brother Cesare, who also left some pictures, is well known by his book of engraved costumes, *Abiti antichi e moderni.* Tommaso Vecelli, also a painter, died in 1620. There was another relative, Girolamo Dante, who, being a scholar and assistant of Titian, was called Girolamo di Tiziano. Various pictures of his were touched up by the master, and are difficult to distinguish from originals. Apart from members of his family, the scholars of Titian were not numerous; Paris Bordone and Bonifazio were the two of superior excellence. El Greco (or Domenico Theotocopuli) was employed by the master to engrave from his works. It is said that Titian himself engraved on copper and on wood, but this may well be questioned.

We must now briefly advert to Titian's individual works, taking them in approximate order of time, and merely dividing portraits from other pictures. Details already given indicate that he did not exhibit any extreme precocity; the earliest works which we proceed to mention may date towards 1505. In the chapel of S. Rocco, Venice, is his "Christ Carrying the Cross," now greatly dilapidated; it was an object of so much popular devotion as to produce offerings which formed the first funds for building the Scuola di S. Rocco: in the scuolo itself is his "Man of Sorrows." The nobly beautiful picture in the Villa Borghese in Rome, commonly named "Divine and Human Love" (by some, "Artless and Sated Love"), bears some obvious relation to the style of Palma Vecchio. The story goes that Titian was enamoured of Palma's daughter; but nothing distinct on this point is forthcoming. The "Tribute Money" ("Christ and the Pharisee"), now in the Dresden Gallery, dated towards 1508; Titian is said to have painted this highly finished yet not "niggling" picture in order to prove to some Germans that the effect of detail could be produced without those extreme minutiae which mark the style of Albert Dürer. The St Mark in the church of the Salute—the evangelist enthroned, along with SS. Sebastian, Roch, Cosmo and Damian—a picture much in the style of Giorgione, belongs to 1512. Towards 1518 was painted, also in the same class of style, the "Three Ages," now in Bridgewater House—a woman guiding the fingers of a shepherd on a reed-pipe, two sleeping children, a cupid, an old man with two skulls, and a second shepherd in the distance—one of the most poetically impressive among all Titian's works. Another work of approximate date was the "Worship of Venus," in the Madrid Museum, showing a statue of Venus, two nymphs, numerous cupids hunting a hare, and other figures. Two of the pictures in the National Gallery, London—the "Holy Family and St Catherine" and the "Noli me tangere"—were going on at much the same time as the great "Assumption of the Madonna." In 1521 Vecelli finished a painting which had long been due to Duke Alphonso of Ferrara, probably the "Bacchanal," with Ariadne dozing over her wine-cup, which is now in Madrid. The famous "Bacchus and Ariadne" in the National Gallery was produced for the same patron in 1523. The "Flora" of the Uffizi, the "Venus" of Darmstadt, and the lovely "Venus Anadyomene" of the Bridgewater Gallery may date a year or so earlier. Another work of 1523 is the stupendous "Entombment of Christ" in the Louvre, whose depth of colour and of shadow stands as the pictorial equivalent of individual facial expression; the same composition, a less admirable work, appears in the Manfrini Gallery. The Louvre picture comes from the Gonzaga collection and from the gallery of Charles I. in Whitehall. In 1530 Titian completed the "St Peter Martyr" for the church of SS. Giovanni e Paolo; for this work he bore off the prize in competition with Palma Vecchio and Pordenone. Of all his pictures this was the most daring in design of action, while it yielded to none in general power of workmanship and of feeling. It showed the influence of Michelangelo, who was in Venice while Vecelli was engaged upon it. A calamitous fire destroyed it in 1867; the copy of it which has taken its place is the handiwork of Cardi da Cigoli. To 1530 belongs also the "Madonna del Coniglio" (Louvre), painted for Gonzaga; to 1536 the "Venus of Florence"; to 1538 the portraits of the "Twelve Caesars," for Gonzaga; and to 1539 the "Presentation of the Virgin in the Temple"—one of the conspicuous examples in the Venetian Academy, yet not of the first interest or importance. About 1540 were done the forcible but rather uninspired paintings for S. Spirito, Venice, now in the church of the Salute—"Cain Killing Abel," the "Sacrifice of Abraham" and "David and Goliath"; in 1543 the "Ecce Homo" of the Vienna Gallery, where Aretino figures as Pilate. The "Venus and Cupid" of Florence, the "Venus" of Madrid and the "Supper of Emmaus" in the Louvre were still in hand, or just completed, when Titian was summoned to Augsburg in 1547. In 1554 he sent to Philip II. in England a second "Danae" and a "Venus and Adonis." About the same time he sent to Charles V. a "Trinity" (or, as Titian himself termed it, "Last Judgment"), which represented the emperor, with his family and others, all in shrouds, praying to the Godhead; Moses and various other personages are also portrayed. This was the object upon which Charles continued to keep his eyes fixed until the film of death closed on them. Later pictures, from 1558 onwards, are the "Martyrdom of St Lawrence," "Christ Crowned with Thorns" (Louvre), "Diana and Actaeon," "Diana and Callisto," "Jupiter and Antiope," the "Magdalene," "Christ in the Garden," and "Europa"—the last six for Philip II.; of the two Diana subjects there are duplicates in London and in Vienna. Philip, it will be observed, was equally *au fait* with nudities and with sanctities. The "Jupiter and Antiope," now much restored, is commonly called "La Vénus del Pardo," having at first been in the Pardo Palace. The "Magdalene" here spoken of (1561) seems to be the picture now in the Uffizi of Florence; Titian, in one of his letters, said that it was the most popular picture he had ever painted. In 1563 Vecelli offered to Philip II. his "Last Supper," which had been in hand for six years; it was cut down in the Escorial to suit a particular space, and offers now little noticeable beyond the fine grouping. The "St Jerome" of the Brera Gallery in Milan, a work of wonderful energy, spirit and force, especially for a more than octogenarian hand, was probably rather earlier than this; there is a replica of it in the Escorial. One of the master's latest pictures (1574–1575) is in Madrid, and commemorates the "Battle of Lepanto"; it is a work of failing power—but still the power of a Titian. Two of the mosaics in St Mark's church, Venice—the Mark in pontificals and the sword-sheathing angel on the right of the high altar—are after Vecelli's designs; but they are contrary to the true spirit of mosaic work, and the Mark in especial is a decided eyesore.

We now turn to the portraits—works so great in style, so stately, and in the best sense so simple in perception and feeling that, after allowing everything which can be said on behalf of some other masters of the craft, such as Raphael, Velazquez, Rubens and Rembrandt, one is still compelled to say that Titian stands on the whole supreme. Among the highest examples are—Alphonso, duke of Ferrara (Madrid), the same duke and his second wife Laura Dianti (Louvre), commonly called "Titian and his Mistress"; Francis I. (Louvre), painted towards 1536, but not from direct sittings, for Titian never saw the French king; various likenesses of himself, one of about 1542, and another of 1562; Paul III., also the same pope with his grandsons Cardinal Alessandro and duke Ottavio (Naples)—the former, done in about four weeks, was presented to the pontiff in May 1543 and cost two gold ducats; Pietro Aretino (Pitti); Titian's daughter Lavinia (with a fan in the Dresden Gallery, with a jewelled casket in Lord Cowper's collection); the Cornaro Family (Alnwick Castle); "L'Homme au Gant" (Louvre), an unknown personage, youthful and handsome, the *ne plus ultra* of portraiture; Sansovino Eleonora duchess of Urbino, Francesco duke of Urbino, Caterina Cornaro queen of Cyprus (these four are in the Uffizi); Charles V. on horseback (Madrid); Cardinal Bembo (Naples), discovered in an uncared-for condition in 1878, very unlike the portrait in the Barberini Gallery. The female portraits done by Titian are few, and are almost invariably of women of exalted rank. Of Ariosto, with whom Titian was intimate in Ferrara, though there may probably have been nothing approaching to a romantic friendship between them, the painter is said to have done three portraits. Much uncertainty, however, besets this matter. One of the three appears as a woodcut in an edition of the *Orlando furioso*. A second, formerly at Cobham Hall, corresponds with the woodcut likeness, and is signed "Titianus F."—a work of admirable beauty; it is now in the National Gallery of London. It is difficult, however, to reconcile the features here with those which appear in some other portraits of Ariosto. There is also in the gallery another and singularly beautiful portrait which used to be called "Ariosto" by Titian, then was assumed to be an "Unknown Poet" by Palma Vecchio; it is now again attributed to Titian, but not as representing Ariosto.

Authorities.—For English readers, the *Life and Times of Titian* by Crowe and Cavalcaselle (1877) superseded all previous works, such as those of Sir Abraham Hume (1829) and Northcote (1830). There is now also the translation (1904) of the monumental German work (1900) by George Gronau, which may be regarded as taking the first place of all. Claude Phillips has brought out two valuable books (1897 and 1898) on the earlier and the later work of Titian, which should be consulted on controversial details. Josiah Gilbert's book, *Cadore, or Titian's Country* (1869), supplies many interesting side-lights on the subject. R. F. Heath's monograph (1885) is founded mainly on Crowe and Cavalcaselle and on Gilbert, and forms a very convenient compendium. (W. M. R.)

TITLE (O. Fr. *title*, mod. *titre*, from Lat. *titulus*), an inscription prefixed to a book or other writing, designating the name by which it is to be known, and in many cases indicating the scope of the book or some idea of the nature of its contents. Further, the term is extended to the descriptive heading or caption to a document, such as a deed or other instrument, or to a bill or act of parliament. Another general meaning is that of an appellation of rank (see Titles of Honour, and the articles Emperor, King, Prince, Majesty, Highness, Duke, &c.). In law "title" is equivalent to right of ownership. The instruments in writing forming the evidences of the title to land are the title-deeds (see Conveyancing; Land Registration). In ecclesiastical usage, the word "title" (*titulus*) are used of certain churches in Rome to which districts were attached, their history being of importance in the evolution of the Roman cardinalate (see Cardinal). It was also used, as now, for a condition precedent to ordination; in the early Roman Church an appointment to officiate in a particular church; this was extended gradually from the idea of locality to that of evidence of means of support. In the Church of England the candidate must have "some certain place where he can exercise his function"; for deacon's orders he must have a nomination to a curacy, and for priest's orders either that or a presentation to a living. A fellowship or chaplaincy at the university of Oxford or Cambridge is also a sufficient "title."

TITLE GUARANTEE COMPANIES, the name given to companies which apply the principle of corporate indemnity to the protection of those interested in real estate titles, either as owners or lenders. They are of the class of indemnity companies in which technical skill and experience in investigation of risks are relied upon to protect the guarantor from loss. They are peculiar to countries where the title to real estate is a matter of public record, and where the complexity of the record and the variety of possible liens and encumbrances have made it difficult and expensive to determine whether the title is good. The only country where they have reached large proportions or achieved success as independent business enterprises is the United States. In Australia no investigation of a title to real estate is necessary, because before the land passed into individual ownership the government adopted a system of state registration and guarantee of title, so that its certificate of registered title was universally accepted. In certain other countries there is neither registration of title nor recording of deeds; the title-deeds are preserved and passed from owner to owner, and are accepted on the authority of the records and opinions of family solicitors. In the United States, however, there have been from the beginning acts providing that all deeds and mortgages be recorded, and the records, when properly made, constitute legal notice to all the world of their contents and claims. At the same time, there are other records of wills, suits, judgments, taxes and mechanics' claims which may encumber the title. In the great cities these various records became in course of time so voluminous that the proper investigation of them, and the determination of the validity of the title in view of them, required the best skill of an experienced lawyer and involved very heavy expenses. On a re-sale of the property the new buyer did not rely upon the lawyer who had made the examination for the seller, but felt called upon to employ and pay his own lawyer, who had to go over the same work again, and more, for with each new transaction the history was getting longer. The delay and expense involved were great, and yet the owner had little or no protection, for a lawyer is not held to guarantee the correctness of his opinion.

The first legislative grant of corporate authority to guarantee titles to real estate was included in the charter of the New York Guaranty and Indemnity Company, a trust company incorporated in New York by act of the legislature in 1864; but the power to guarantee titles was never exercised. In 1869 the Real Estate Assurance Company of the City of New York was chartered with the sole object of insuring the validity of titles, but was never organized. In 1871 a pamphlet was issued by a member of the New York bar, calling attention to the business carried on by the Prussian Mortgage Insurance Company of Berlin, and outlining plans very similar to those now followed by the principal title guarantee companies of the United States; but the pamphlet seems to have been forgotten. The first company actually to undertake the guarantee of real estate titles was formed in Philadelphia, Pennsylvania, in 1876. It differed from the Prussian Mortgage Insurance Company (which guaranteed titles merely as an incident in its business as a dealer in, and custodian and guarantor of, mortgages) in that its main business was the issue of a policy of guarantee on a transfer of title to land. The advantages of its method were immediately recognized. Corporations to carry on the business were organized in Washington, Baltimore, Boston and New York, in the order named, and subsequently in nearly every considerable city in the United States.

In order to be independent of the inaccurate and clumsy methods of the public record offices, title guarantee companies generally compile in their own office a copy or digest of all the real estate records of the locality in which they are established, maintaining for this purpose a staff of skilled clerks. To make the necessary examination of a title prior to the issuing of a guarantee, they require continually a body of experienced real estate lawyers. By these means a title can be examined and guaranteed in a week, whereas thirty or forty days was formerly required. This has done much to make real estate available capital, for individual and corporate lenders on mortgage accept the guarantee of the companies as the best evidence of title, and loans can be had without the delay that once prevailed.

The expense of maintaining the staff of clerks and lawyers is great, amounting to half of the gross charges on titles guaranteed. Strictly speaking, the risks outstanding are also large, running up to $100,000,000 a year for a single company in New York City; but in well-managed companies the losses are very small, not exceeding 2 % of the gross charges on titles guaranteed, so that the outstanding obligations should scarcely be called risks. In spite of the office expenses, the charges for first bringing a piece of land under the guarantee are no more than owners were in the habit of paying each time for examination and opinion by counsel, amounting to about one-half of 1 % on the value of the property or on the amount of the mortgage; and when once the guarantee has been issued, it is re-issued on a subsequent sale or mortgage on short notice and for a small fee. (C. H. K.)

TITLES OF HONOUR, "those various names of greatness or eminency, which are the most distinguishing titles of civil dignity" (John Selden, *Titles of Honor*, 3rd ed., 1672). This definition covers, if we understand "civil" in its proper and widest sense, all titles, whether official or honorary, civil or military, temporal or ecclesiastical. In general, however, we now understand by titles of honour what Selden calls "honorary titles," *i.e.* distinctive designations implying rank and dignity, not office or vocation. The broader definition would cover all titles, including those of military and ecclesiastical rank, of municipal office and of university degrees. The narrower definition, which it is proposed to adopt for the purposes of this article, would cover only what in the United Kingdom are known as the "titled classes," which embrace only those whose titles are meaningless save as a mark of rank. In this category it is, however, necessary to include, somewhat illogically, the highest titles of all—those of sovereigns; for, though they have not been divorced from the functions of sovereignty, they are the fount and source of all the rest. In the present work a large number of titles are dealt with under their several headings (EMPEROR, KING, DUKE, &c.); in this article it is proposed therefore to discuss them only in their general aspect and to attempt some classification of them according to their meanings and origins.

The philosophy of titles is as tempting a subject as Carlyle found the philosophy of clothes. The democrat and the superior man affect to despise them. They point out that the world's greatest men need no such hall-mark to prove they are not base metal; in England they point to such examples as those of Pitt and Gladstone, who, dispensers of titles themselves, lived and died untitled; and they argue that to accept a title is not a sign of "greatness or eminency," but at best of a quality which falls short of this standard. This attitude has some justification in the limitless abuse at all times in the bestowal of titles as a means of bribing those whose ambition looks no higher than to be a "figure among cyphers." But the desire to be taken notice of is an instinct too deeply rooted in human nature for all the satirists that ever lived, or shall live, to eradicate; and of this instinct titles are the most ancient expression, more ancient—it may be hazarded—even than clothes.[1] The French Revolutionists in their zeal for primeval equality essayed to abolish them; at best they succeeded in making them universal, the *citoyens* of the first generation of republican France becoming the *monsieurs* of the next—just as every Englishman is now a "gentleman" or an "esquire," every Castilian a *caballero*, and every German a *Herr*. Similarly, in the democratic countries of the English-speaking world the common style of Mr (master), also once a prerogative of gentle birth, is apt to become too commonplace, and the official prefix of "honourable" is assumed on very slender pretexts. For where titles are not planted, they tend to sow themselves.

Titles are also elaborated under cultivation; for they are apt to degenerate if too widely scattered, and need to be crossed with other varieties to produce a more marketable type. Thus James I. of England produced the baronet (*q.v.*), and the titles of minister plenipotentiary, and envoy extraordinary were combined in the evolution of that fine flower of diplomacy the "envoy extraordinary and minister plenipotentiary," so styled *honoris causa*, since technically he is neither "extraordinary" nor, as such, armed with plenary powers (see DIPLOMACY). These are but two familiar examples of a process which was at one time carried on with a singular earnestness and in a spirit of the keenest competition. Rival sovereigns, by the mouths of heralds and ambassadors, recited the long roll of their styles and titles at each other, in the spirit of Homeric heroes endeavouring to shout down the enemy before coming to blows. The ambassador of Queen Elizabeth to the tsar of Muscovy boggled at the length and complexity of the barbaric emperor's style, and endeavoured to address him by six of his principal titles only, but in the end was forced to repeat the whole (Fletcher, *Russian Commonwealth*, cap. 6). As for the Ottoman sultans, the Oriental imagination of their secretaries was exhausted in adding "exorbitant and swelling attributes" to their styles, which were usually intended to be insulting to those whom they addressed. Thus Ahmed I., writing to Henry IV. of France, describes himself, with very much besides, as "emperor of victorious emperors, distributor of crowns to the greatest princes of the earth, . . . lord of Europe, Asia and Africa."

So far as medieval Europe was concerned, the court of Constantinople, where East and West met, was the forcing-bed of the more extravagant varieties of titles and attributes. Old Rome had granted to its deserving citizens titles of honour, such as *felix*, *pius*, *pater patriae*, besides those which, like *patricius*, denoted hereditary rank. The first emperors were, in theory, merely citizens who alone and in a supreme degree were entitled to be the recipients of these honours. But the *majestas reipublicae Romanae* was soon identified with the person of the emperor. Himself become the fountain of honour, he showered his titular attributes upon those whom it was his whim or his policy to distinguish, while ever fresh styles were invented to illustrate his own unique dignity. For this purpose all the abstract terms in the vocabulary of flattery were put under contribution, not even excepting the lofty attributes of God (*nostra eternitas*, *nostra perennitas*, "most high," "most mighty," "most sacred majesty"). This tendency ran riot when the East Roman Empire had become byzantinized, until by the middle ages there was—to quote Selden— "such innovation of titles as made the dignities of the empire almost ridiculous in those strange and affected compounds."[2]

From the Byzantine court that of the Frankish emperors of the West largely borrowed its forms, and this again set the fashion for the courts of lesser potentates. To this source, then, are due the honorary attributes, if not in all cases the titles, of the sovereigns of modern Europe. Throughout the middle ages, indeed, there was no rigid classification of the abstract attributes (highness, eminence, excellency, honour and the like) addressed in the second and third persons to sovereigns or other dignitaries. These depended very much on the fancy of secretaries eager to display their Latinity—or even a smattering of Greek—by

[1] Many proper names are but primitive titles in disguise: *e.g.* Henry (*q.v.*) = "ruler of the home," or Walter = "lord of power."

[2] *E.g. Sebastocrator*, compounded of σεβαστὸς (augustus) and κρατεῖν (to rule), or *panhypersebastos*.

devising new forms.[1] It was not until the 17th century that they became fixed, under the influence mainly of the newly organized international diplomatic service (see DIPLOMACY). But meanwhile they had developed from the simplicity of the early feudal age[2] into a Byzantine pomposity, the exuberance of which bored even the ceremonious court of Spain into a free use of the pruning knife.[3] Honorary styles are, for the rest, now mere stereotyped formulae; the words that compose them have become—to use Emerson's phrase— "polarized" and deprived of meaning. Not otherwise could a German journalist, late in the 19th century, have recorded, without exciting surprise, that "to-day their All-highest majesties went to church to give thanks to the Highest."[4] The same is more or less true of all titles. They are traditional, and are mainly valued for this reason. An imaginative person might devise a dozen styles in themselves better fitted to express the peculiar eminency of a successful money-lender or a wealthy brewer than the feudal title of baron, or than that of knight to indicate the qualities of a Radical apostle of the gospel of "peace at any price." But the instinct in these matters is to put new wine into old bottles; and, on the whole, the bottles bear the strain. The process is, indeed, very old. William Harrison, in his inimitable style, has left a description of it in the 16th century (see GENTLEMAN), and it was older far than his day. In all ages the new nobility has been looked down upon by the old; but the ancient titles have always in the end adapted themselves to their new users. Long before the *bourgeois* age was dreamed of, dukes as such had ceased to "lead" (*ducere*), marquesses to guard the "marches," *Ritters* to "ride," and no one marked the incongruity of their styles. The process is but continued if, for instance, in the 20th century the title of baron often suggests, not the feudal power of the sword, but the international power of the purse.

Titles have therefore in themselves a world of historical significance. In some the significance is obvious, the history comparatively recent. In others the significance is veiled under obscure etymologies, which carry us back to the very beginnings of social life. We find in these words, too, most singular contrasts of fortune. Caesar, a nickname (*caesaries*) given to some long-haired Roman, grows into a surname which the founder of the empire chanced to bear, and so remains to this day the title of German kaisers and Slavonic tsars, of the king of England as Kaisar-i-Hind and of the sultan of Turkey as Kaisar-i-Rum. The first of the German Caesars bore the name of Karl,[5] which in itself means no more than "man" and in English speech has sunk to the base meaning of "churl" (see CHARLES); for the barbarians beyond the eastern borders of his empire, the Slavs and Magyars who felt the weight of his arm, his name became identified with his office, and remains to this day in the sense of "king" (Mag. *Király*, Slav. *Kral*, Russ. *Korol*).[6] On the other hand, we have the contrary process. The proud title of "count of the stable," once borne by the highest official of the Byzantine court, is now associated in the public mind mainly with humble police officials, in the United States with the humblest of all, the village constable only (see CONSTABLE). Less impressive perhaps is the fate of the title "valet," which, once that of a gentleman, has sunk to be that of a "gentleman's gentleman" (see VALET). The same word, too, develops differently in different languages. The German *Knecht* remains a servant; in England the *cniht* has developed into the knight, just as the *serviens* (servant) survives in the very various modern uses of the title serjeant (*q.v.*). In one exalted case at least we even have a title based on a mistaken etymological deduction. The title "Augustus," *i.e.* sublime or sacred, used originally of persons or places consecrated by the auguries, is derived ultimately, in a passive sense, from *augere*, to increase. This led to the rendering of the Latin title "semper Augustus," borne by the Holy Roman emperors until 1806, in German as "at all times augmenter of the empire" (*zu allen Zeiten Mehrer des Reichs*), a style as ill-grounded in etymology as it was lamentably untrue in fact.[7]

The fortunes of individual titles are outlined in the separate articles devoted to them. Here it only remains to discuss them generally from the point of view of their classification according to origin and general character. Of the styles that are mere attributes—like serene, honourable, reverend—enough has been said; they are but stereotyped courtesies. Most titles proper, on the other hand, have in their origins a deeper significance. The title king, for instance, recalls a remote time when it was borne by right of kinship, as head of a tribe (see KING). Other titles recall that forgotten stage of society in which it was the rule for age to command and youth to obey: such as the French *seigneur*, *sieur*, *sire*, *monsieur*, *monseigneur*; the Italian *signor*, *monsignore*; the Spanish *señor*, and the English "sir," all derived from *senior*, "older" (see MONSIEUR and SIR), itself a Latin translation of a type of title which in the Teutonic languages appears to survive only in the English alderman (*q.v.*). *Seigneur*, *sire* and the rest developed, of course, into the equivalents, not of *senior*, but of *dominus* (lord). But the idea of the title originally must have been the same as that of "elder," like the Arab *sheikh* (*q.v.*) or the *starostas* and *starshinas* of the Russian village communities; the *seniores*, in early feudal times, were the full grown fighting men as opposed to the *pueri* (boys), the unfledged squires and valets. Other titles are derived from the idea of command or rule: such are those of emperor (*q.v.*); the Latin *rex* (*regere*, to rule, guide)—whence the French *roi*, Italian *rè* and the English attributive style "royal"—and from the same common Indo-European root the Indian titles of *raja* and *maharaja*; the title of duke (*q.v.*); the Latin *dominus*, *domina* (originally, a master or mistress in the house, *domus*), whence the modern *dame*, *madame*, *mademoiselle*, *don* and *dom*; the German *Herr* (cf. *herrschen*, to rule); or, to take an Oriental instance, that of *sultan* (Arabic *salat*, to rule). Some titles again are derived from mere ideas of precedence, like that of "prince" (*q.v.*), which may be described as the generic sovereign title; the Spanish title of "grandee" (*q.v.*); or that of "master" (*q.v.*), which as a title of honour survives in Scotland. Very rare are the titles of honour that have their origin in the idea of gentle birth, which indeed, in earlier times, was predicated of all wearers of titles in Europe. The only modern equivalent of the Anglo-Saxon *ætheling* (*q.v.*) in Europe would appear to be the Austrian title of *Edler*, which means, strictly speaking, no more than "noble," though it implies a rank higher than that of the untitled *Adeliger*. The English title "earl" (*q.v.*) has a similar origin, but passed through the stage of an official style as the equivalent of "count." The word "gentleman" (*q.v.*) is not a title, any more than the French *gentilhomme*; it is, in so far as it is used in any definite sense at all, an attribute, like the German *hochwolgeboren* or the Russian *barin*—the equivalent of the Latin *generosus*, "well-born." In the Mahommedan East its equivalent, in the sense of well-born, is the Arabic title *sherīf*,

[1] The papal chancery, however, seems early to have established definite rules. Those sovereigns who had special titles, bestowed or recognized by the pope, such as "Most Catholic King" (Spain) or "Most Christian King" (France), were so addressed. The rest were "Illustrious" (*illustres*).

[2] The only title of mere honour would, *e.g.* in the 12th century, seem to have been *dominus* (*Sire*, *Lord*), which in the Anglo-Norman poem of *Guillaume le Maréschal* is applied to any one of birth, from the king's son of France down to the humblest noble (see SIR).

[3] By the *Pragmatico de los titulos y cortesias* of the 8th of October 1636 King Philip III. decreed that he was to be addressed in letters only as *Señor*, while at the end was to appear no more than "God guard the Catholic person of your Majesty." (Selden p. 103.)

[4] Die Allerhöchsten Herrschaften sind heute in die Kirche gegangen dem Höchsten ihren Dank u.s.w. The sentence is fixed in the writer's memory, but the exact reference is forgotten.

[5] Known traditionally as Charlemagne (*Carolus Magnus*, Karl the Great), the unique instance of a posthumous title of honour being absorbed into a name. Modern English historians have tended to dissolve this immemorial union in the interest of historic accuracy. But "Charles" is only a degree less conventional than Charlemagne.

[6] A parallel case, but more obscure, of a proper name developing into a title is that of the curious title of "Dauphin," ultimately borne only by the heir-apparent to the French throne (see DAUPHIN).

[7] So Rigord, the monk of St Denis, says in his *Gesta* of Philip Augustus, king of France, that he was so styled after the Caesars, who bore the name of Augustus because they augmented the empire. *Unde iste merito dictus est Augustus ab aucta republica.*

now applied only to the descendants of the Prophet. The most characteristic and familiar of English titles, again, that of "lord," carries us back to a very primitive state, when the lord was *par excellence* the "loaf-warden" (*hlaf-ord*, *hlaf-weard*). Here it may be noted that the title "lord" has no foreign European equivalent: the German *Herr* (though *Herrenhaus* is strictly House of Lords), the Italian *signor*, the Spanish *señor*, the Slavonic *pan* and the Greek *κύριος* are all equivocal, being used most commonly in the sense of Mr (Master). Even the French do not translate "lord" by *monseigneur* (though *seigneur* is strictly speaking its equivalent), and still less by *monsieur*, though the ancient custom has survived of using the latter colloquially in place of all titles,[1] but by *milord*. Lastly there are two important European titles derived from personal relations with the sovereign, though they have long ceased to have any such connotation. Of these the oldest is that of "count," which goes back to the *comites* (companions) of the early Roman emperors (see COUNT); the second is "baron," originally meaning no more than "man" and so, under the feudal system, the king's "men" *par excellence*, the great tenants-in-chief of the crown (see BARON). In England the barons formed and form the body of the peerage, "peer" not being a title of honour, but the description of a status and function bestowed by their creation upon all barons, viscounts, earls, marquesses and dukes (see PEERAGE). In France, on the other hand, "peer" (*pair*) was under the old monarchy a title of honour; for not even all dukes were peers of France, and the style of such as were, therefore, ran *duc et pair*.

From the above it will already have become apparent that titles of honour, as they now survive in Europe, are picturesque relics of the feudal system (see FEUDALISM). In theory they are still territorial, and it is the shadowy suggestion of landed estate that gives, in France and Germany, to the nobiliary particles *de* and *von* their mystic virtue.[2] In Great Britain there has been of late years a tendency in the case of some newly made peers to drop the affectation of territorial power. In the case of some titles, *e.g.* Earl Carrington—this merely follows a very ancient English tradition; even under the feudal system after the Norman Conquest it was not unusual for the great nobles to use their titles with their family names or those of their fiefs indifferently; for instance, the Norman earls of Derby described themselves, as often as not, as Earls Ferrers (see DERBY, EARLS OF). Convention, however, dictates that barons and viscounts should, on creation, adopt a territorial style. In the case of such titles as Lord James of Hereford and Lord Morley of Blackburn, this style is adopted from the place of birth; for which a certain precedent might perhaps be pleaded in the medieval custom exemplified in such names for royal princes as "John of Gaunt" or "Henry of Woodstock." On the other hand, there has been also a somewhat absurd tendency to exaggerate the territorial styles by piling one on the top of the other. It would be invidious to mention actual instances; but the process may be illustrated by the imaginary title of Baron Coneyhurst of Ockley.

From the fact that, as feudalism developed, fiefs became hereditary, it comes that most European titles of honour are hereditary. Knighthood alone formed, in general, an exception to this rule. Yet, in their origin, no one of the titles familiar to us were descendible from father to son, and the only hereditary quality was that of abstract nobility. Yet, by a curious inversion of the whole idea of titles of honour, an inherited title has come to be far more valued than one bestowed;[3] it has the peculiarly aristocratic virtue ascribed by Lord Palmerston to the most Noble Order of the Garter: "There is no damned merit about it;" it has the crowning quality that it must needs be the monopoly of the few. Hereditary titles sink in value, indeed, just in proportion as they become common. In the United Kingdom their value has been kept up by the rule of primogeniture: there can be only one bearer of such a title in a single generation. In France custom distributes the various titles of a family among all the sons, the eldest son, for instance, of a duke inheriting his dukedom, the second son his marquisate, the third his countship, and so on. In Germany and Austria titles pass to all the sons in each successive generation, though in Prussia the rule of primogeniture has been introduced in the case of certain new creations (*e.g. Fürst*, prince). The result is that equivalent titles vary enormously in social significance in different countries. An attempt has been made to estimate the extent of this variation in the case of individual titles in articles devoted to them. Here we need only illustrate the argument by one striking example. The Russian title of "prince" (*knyaz*) implies undoubted descent from the great reigning houses of Russia, Poland and Lithuania; but the title descends to all male children, none of whom is entitled to represent it *par excellence*. There may be three or four hundred princes bearing the same distinguished name; of these some may be great nobles, but others are not seldom found in quite humble capacities—waiters or droshky-drivers. The title in itself has little social value.

In the countries east of the marches of the old Empire, *i.e.* Hungary and the Slav lands, existing titles are partly developed from the native tradition (feudal in Hungary, Bohemia and Poland; autocratic and Oriental in Russia and the lands of the Balkan peninsula), partly borrowed from the West, like that of *gróf* (count) in Hungary and *graf* in Russia. Just as in autocratic Russia the sole indigenous title of honour (*knyaz*) is associated with royal descent,[4] so in the Mahommedan East there are, outside the reigning families, no hereditary titles, except that of *sherīf*, already mentioned. In India the hereditary styles of certain great Mahommedan nobles are exceptions that prove the rule; they represent reigning families whose *raj* has been absorbed in the imperial government, and they are still reigning princes in the sense in which the heads of German mediatized houses are so described (see MEDIATIZATION). For the rest, the titles of Oriental princes follow much the same gradation as those of the West. As caliph (*q.v.*), or vicar of the Prophet, the Ottoman sultan is in Islam the equivalent of the pope in Roman Catholic Christendom; his imperial dignity is signified by the Persian title of *padishah* (lord king), his function as leader of a militant religion by the style of "commander of the faithful" (see AMIR). *Shah* is in Persia the equivalent of king; the style of *shah-in-shah*, king of kings, recalls the days of the Persian "great king" familiar in the Old Testament. *Khan* (prince) and *amir* (commander, lord) are other Eastern sovereign titles. Pasha and bey, originally exclusively military titles, are now used also as civilian titles of honour, but they are not hereditary. When the pashalik of Egypt was made hereditary the situation was ultimately regularized by bestowing on the pasha the Persian title of khedive (*q.v.*). In the Far East, Japan has adopted a system of titles, based on her ancient feudal hierarchy, which closely corresponds to that of Europe (see JAPAN). China, on the other hand, stands apart in the curious custom of bestowing titles on the ancestors of persons to be honoured, and in making them hereditary only for a limited number of generations (see CHINA: *Social Customs*). In Europe such posthumous honours are rendered only in the case of saints (see CANONIZATION).

Of ecclesiastical titles of honour it can only be said that they tend to an even greater exaggeration than those bestowed on secular dignities. The swelling styles of the Eastern patriarchs are relics of the days when Rome, Constantinople, Antioch, Alexandria and Jerusalem were vying with each other for precedence (see CHURCH HISTORY and PATRIARCH). The style

[1] *E.g.* Monsieur de la Rochefoucauld, for M. le duc de la R. In the United Kingdom the parallel custom stops short of dukes. All other peers, from marquesses to barons, are commonly spoken of and addressed by the title of lord.

[2] In Germany a distinction is drawn between those titles derived from estates still held by the head of the family and those that are landless. The latter are simply "of" (*von*), the former are "of and at" (*von und zu*).

[3] Thus in the *Instructions* annexed to the commission for the selection of the new order of baronets, King James I. gives these precedence over knights, "because this is a *Dignity*, which shall be *Hereditary*, wherein divers circumstances are more considerable, than such a Mark as is but *Temporary*." (Selden, *op. cit.* p. 685.)

[4] The designation *barin* (boyarin, boyar) is not, properly speaking, a title, but the equivalent of "gentleman."

of the bishop of Rome, who alone in the Western Church retains the name of pope, includes the old Roman titles of *pontifex maximus* and *pater patriae*, and always in his signatures the proudly humble phrase "slave of the slaves of God" (*servus servorum Dei*), based on Matt. xx. 27 (see POPE). Of ecclesiastical titles those expressing orders and no more—priest, deacon, sub-deacon and the rest—are never honorary (Prester John, *q.v.*, is a shadowy medieval exception). Those expressing office, whether in the Church at large (patriarch, archbishop, &c.), or in the papal court (*e.g.* protonotary), are often merely honorary. That of bishop even became for a time, after the Reformation, a title borne by certain secular princes (see BISHOP). "Cardinal," which with the predicate Eminence (*q.v.*) is now reserved for the princes of the Roman Church, was at one time the honorary style of the chief clergy of great cathedrals generally (see CARDINAL). "Abbot," the official title of the head of the monastery, has also in several languages (*e.g.* the French *abbé*) come to be used as a purely honorary title (see ABBOT). For the honorary styles of the clergy in the English-speaking countries, see the articles REVEREND, VICAR, RECTOR, CANON, DEAN. As for the archdeacon, it is only in the Church of England that he can be still defined as "one who performs archidiaconal functions"; elsewhere, if he exists at all, he is purely titular (see ARCHDEACON).

Among titles of honour, finally, may be reckoned honorary degrees bestowed by universities, the pope, and in England by the archbishop of Canterbury. Any degree may be bestowed *honoris causa*. The universities of Oxford and Cambridge thus regularly bestow the degree of D.D. (doctor of divinity) on those of their *alumni* who become bishops. It is also the custom to bestow honorary degrees at the yearly "Commemoration" (generally D.C.L., doctor of civil law, at Oxford; LL.D., doctor of laws, at Cambridge) on a selected list of eminent personages. The right of the archbishop of Canterbury to confer degrees *honoris causa*, known as "Lambeth degrees," is supposed to be derived from one of his powers as *legatus natus* of the pope, which survived the Reformation. An attempt was made by some of the Swiss reformers of the 16th century to abolish degrees. They were certainly "popish" in their origin, and others besides Herbert Spencer have objected to them as misleading, since they are by no means necessarily a hall-mark of learning. They tend, however, to multiply rather than to decrease in number, and in England some criticism has been aroused by the growing custom in certain quarters of assuming degrees (notably that of D.D.) granted corruptly, or for wholly insufficient reasons, by certain so-called "universities," notably in the United States. For a list of the degrees of the principal universities and their hoods, see UNIVERSITIES, *ad fin.*

The history of many peerage and other titles is outlined in the articles on historic families in this work. For British peerage titles the standard work is G. E. C. (okayne)'s *Complete Peerage* (1st ed., 8 vols., 1887; new ed., vol. i., 1910). For baronets and others see the manuals of Burke and Debrett. The standard authority for the royal houses and "high nobility" of Europe is the *Almanach de Gotha*, published yearly. See also the article NOBILITY, and for further references the authorities attached to those on individual titles, *e.g.* COUNT. (W. A. P.)

TITMOUSE (O. Eng. *mase* and *tylmase*, Ger. *Meise*, Swed. *mes*, Du. *mees*, Fr. *mésange*), the name[1] long in use for several species of small English birds, which are further distinguished from one another by some characteristic appellation. These go to make up the genus *Parus* of Linnaeus, and with a large number of other genera form the Passerine family Paridae. Titmice are usually non-migratory, and the genus *Parus* occupies most of the globe except South America and the Australian region east of Lombok and Flores.

[1] The prefix "tit" by heedless writers often used alone, though equally proper to the titlark (see PIPIT), is perhaps cognate with the Greek τιτίς, which originally meant a small chirping bird (*Ann. Nat. Hist.*, 4th series, vol. x. p. 227), and has a diminutive form in the Icelandic *Titlingur*—the English or at least Scottish *titling*. It is by false analogy that the plural of titmouse is made titmice; it should be titmouses. A nickname is very often added, as with many other familiar English birds, and in this case it is "tom."

Among the more common European and English forms the first to be mentioned is that called, from its comparatively large size, the great titmouse, *P. major*, but known also in many parts as the oxeye,[2] conspicuous by its black head, white cheeks and yellow breast, down which runs a black line, while in spring the cock makes himself heard by a loud love-note that resembles the noise made in sharpening a saw. It is widely distributed throughout the British Islands and over nearly the whole of Europe and northern Asia. The next is the blue titmouse, bluecap or nun, *P. coeruleus*, smaller than the last and more common. Its names are so characteristic as to make any description needless. A third common species, but not so numerous as either of the foregoing, is the coal-titmouse, *P. ater*, distinguished by its black cap, white cheeks and white nape. Some interest attaches to this species because of the difference observable between the race inhabiting the scanty remnants of the ancient Scottish forests and that which occurs throughout the rest of Britain. The former is more brightly tinted than the latter, having a clear bluish-grey mantle and the lower part of the back greenish, hardly either of which colours are to be seen in the same parts of more southern examples, which last have been described as forming a distinct species, *P. britannicus*. But it is to be observed that the denizens of the old Scotch fir-woods are nearly midway in coloration between the dingy southern birds and those which prevail over the greater part of the continent of Europe. It would therefore seem unreasonable to speak of two species only: there should be either three or one, and the latter alternative is to be preferred, provided the existence of the local races be duly recognized. Much the same thing is to be noticed in the next species to be mentioned, the marsh-titmouse, *P. palustris*, which, sombre as is its plumage, is subject to considerable local variation in its very extensive range, and has been called *P. borealis* in Scandinavia, *P. alpestris* in the Alps, and *P. lugubris* in south-eastern Europe, to say nothing of forms like *P. baicalensis*, *P. camchatkensis* and others, whose names denote its local variations in northern Asia, while no great violence is exercised if to these be tacked on *P. atricapilla*, with several geographical races which inhabit North America. A fifth British species is the rare crested titmouse, *P. cristatus*, only found in limited districts in Scotland, though common enough, especially in pine-woods, in many parts of Europe.

In addition to species of *Parus*, North America possesses two peculiar genera of tits—*Psaltriparus* and *Auriparus*. During the greater part of the year the various species of the genus *Parus* associate in family parties and only break up into pairs at the beginning of the breeding season. The nests are nearly always placed in a hollow stump, and consist of a mass of moss, feathers and hair, the last being worked almost into a kind of felt. Thereon the eggs, often to the number of eight or nine, are laid, and these have a translucent white shell, freckled or spotted with rust colour. The first plumage of the young closely resembles that of the parents; but, so far as is known, it has always a yellower tinge, very apparent on the parts, if there be such, which in the adult are white. Few birds are more restless in disposition. Most of the European species and some of the North American become familiar, haunting the neighbourhood of houses, especially in winter, and readily availing themselves of such scraps of food, about the nature of which they are not particular, as they can get.[3] By gardeners every titmouse is generally regarded as an enemy, for it is supposed to do infinite damage to the buds of fruit-trees and bushes; but the accusation is wholly false, for the buds destroyed are always found to be those to which a grub—the bird's real object—has got access, so that there can be little doubt that the titmouse is a great benefactor to the horticulturist.

Akin to the genus *Parus*, but in many respects differing from it, is *Acredula*, containing that curious-looking bird the long-tailed or bottle titmouse, with many local races or species. The bird itself, having its tail longer than its body, is unlike any other found in the northern hemisphere, while its nest is a perfect marvel of construction, being in shape nearly oval, with a small hole in one side. The exterior is studded with pieces of lichen, worked into a firm texture of moss, wool and spiders' nests, and the inside is profusely lined with soft feathers—2379 having been, says Macgillivray, counted in one example. Not inferior in beauty or ingenuity is the nest built by the penduline titmouse, *Aegithalus pendulinus*, of the south of Europe, which differs, however, not merely in composition, but in being suspended to a bough, while the former is nearly always placed between two or more branches.

The so-called bearded titmouse, *Panurus biarmicus*, has habits wholly unlike those of any of the foregoing, and is now placed in

[2] The signification of this name is obscure. It may perhaps be correlated with a Swedish name for the bird—*Talgoxe*.

[3] Persons fond of watching the habits of birds may with little trouble provide a pleasing spectacle by adopting the plan, practised by the late A. E. Knox, of hanging a lump of suet or tallow by a short string to the end of a flexible rod stuck aslant into the ground close to the window of a sitting-room. It is seldom long before a titmouse of some kind finds the dainty, and once found visits are made to it until every morsel is picked off. The attitudes of the birds as they cling to the swinging lure are very diverting, and none but a titmouse can succeed in keeping a foothold upon it.

a separate Passerine family—Panuridae. It was formerly found in many parts of England, especially in the eastern counties, where it bore the name of reed-pheasant;[1] but through the draining of meres, the destruction of reed-beds, and the rapacity of collectors it now exists in few localities. It is a beautiful little bird, of a bright tawny colour, variegated with black and white, while the cock is further distinguished by a bluish grey head and a black tuft of feathers on each side of the chin. Its chief food seems to be reed-seeds and the smaller kinds of fresh-water molluscs, which it finds among the reed-beds it seldom quits.

The general affinities of the Paridae seem to lie rather with the Sittidae (see NUTHATCH) and the tree-creepers. (A. N.)

TITUS, one of the companions of St Paul, was of Greek origin (Gal. ii. 3), and was perhaps a native of Asia Minor. He appears to have been among the apostle's earliest converts, being first mentioned (Gal. ii. 1) as having accompanied Paul and Barnabas to Jerusalem (cf. Acts xv. 2) "to represent the success of the Pauline gospel outside Judaism." Here the conservative section demanded that he should be circumcised; but Paul successfully opposed this (see PAUL). Subsequently he came into close connexion with the Achaean churches and especially with Corinth, bearing letters from Paul and being charged with promoting the proposed collection for poor Christians in Judaea. In these matters he proved himself a trusty lieutenant, winning the esteem of the Corinthians by his zeal and disinterestedness. The liberality which a generation later was recognized by Clement of Rome as a traditional virtue of the Corinthian Church owed its inception to Titus. In the epistle with which his name is associated he is represented (Titus i. 5) as having been left by Paul in Crete to "set in order the things that are wanting, and ordain elders in every city." He is expected afterwards to join Paul at Nicopolis (iii. 12). In 2 Tim. iv. 10 he is spoken of as having gone (perhaps on a mission) to Dalmatia. Tradition, obviously resting on the Epistle to Titus, has it that he died in Crete as bishop at an advanced age; another line connects him with Venice. Attempts to make him the author of the "We" sections in Acts and to include him in the seventy disciples are futile. There is more to be said for the suggestion that he was the brother of St Luke.

See A. Souter and E. P. Boys-Smith in *The Expository Times*, xviii. 285, 335, 380.

TITUS, THE EPISTLE TO, in the New Testament, an epistle which purports to have been written by Paul to Titus (i. 1–4), who is in charge of the local churches at Crete (i. 5). The younger man is reminded of the qualifications which he is to insist upon in officials (i. 5–16), in view of current errors,[2] doctrinal and moral. The genuine teaching, or "sound doctrine," which he is to propound (ii. 1, seq.), is then outlined, with regard to aged men and women, younger men and slaves especially.[3] After a postscript (iii. 8–11), reiterating the counsels of the letter, with particular reference to the outside public, some personal notices are briefly added (iii. 12–13), and, with some final exhortations, the epistle ends.

The origin of Christian missions in Crete is obscure. A strong Jewish element existed among the population (cf. i. 13 seq., iii. 9), which explains the particular hue of the local heresies as well as, perhaps, the initial efforts of a Christian propaganda (cf. Acts ii. 11). The geographical situation of the island also favoured an early introduction of the new faith. "Crete was a great wintering place" for vessels (cf. Acts xxvii. 12 seq.) working their slow way to Rome along the southern coast of the Mediterranean,[4] so that the possibility of Jewish Christian evangelists having reached it before long is to be granted freely.

[1] The common names given to this bird are so very inapplicable that it is a pity that "silerella" (from *siler*, an osier) bestowed upon it by Sir T. Browne, its original discoverer, cannot be restored.

[2] On the somewhat harsh estimate of the Cretans in i. 12 see Dr J. Rendel Harris in *Expositor* (7th series, vol. ii. p. 305 seq.). The other features noted in the epistle, their turbulence, drunkenness and greed, all happen to be verified in the pages of ancient writers like Polybius.

[3] On the sub-Pauline tone of iii. 5 cf. Sokolowski's *Geist und Leben bei Paulus* (1903), p. 108 seq.

[4] Cf. W. M. Ramsay: *Pauline and other Studies* (1907), p. 76, Hoennicke's *Das Judenchristentum* (1908), p. 156 seq., and Harnack's *Mission and Expansion of Christianity*, ii. 229–230 (2nd ed., 1908).

It is more difficult to determine when Paul can have visited the island and left Titus behind him. Attempts have been made to find a setting for the epistle within the apostle's life previous to his Roman imprisonment (as recorded in Acts), but by common consent[5] it is now held that the epistle (if written by the apostle) must fall later, during the period of missionary enterprise which is supposed to have followed his release from the first captivity. Like the epistles to Timothy, the Epistle to Titus thus belongs to a phase of the apostle's life for which we possess no other contemporary evidence. The second imprisonment of Paul, after a period of freedom following his acquittal, is an historical hypothesis (cf. the statement in Steinmetz's *Die zweite röm. Gefangenschaft des Paulus*, p. 46 seq.), which is absolutely essential to the Pauline authorship of the pastorals. It is indeed supported by several critics who reject the latter, just as it is occasionally rejected by advocates of their authenticity. But, upon the whole, such evidence from early tradition as can be adduced from the 2nd century seems no more than an expansion of Paul's language in Rom. xv. 24, 28. The pastorals themselves never mention any mission in Spain. Spanish tradition is silent on the fact, and the allusion to the "west" (in Clem. Rom. v.) can be interpreted at least as fairly of Rome as of Spain. The entire problem is not without its difficulties still, after all the research lavished upon it, but the probabilities seem to converge upon the conclusion that Paul was never released from his imprisonment, and consequently that he never revisited the East.

The internal criticism of the epistle starts from i. 7–9, which is plainly an interpolation, perhaps from the margin, upon the qualifications of *episcopoi*. On the other hand a passage like iii. 12–13 is indubitably a Pauline fragment, and the problem for the critic is to determine whether in the epistle as a whole we have a redacted and interpolated edition of what was originally a note from the hand of Paul, or whether the epistle drew upon some Pauline tradition (connecting Titus with Crete) and material, and was afterwards interpolated at i. 7–9. The latter hypothesis seems more probable, upon the whole, although there is little to choose between the two. The substantially Pauline character of the epistle, for all practical purposes, is to be granted upon either hypothesis, for the author or the editor strove not unsuccessfully, upon the whole, to reproduce the Pauline spirit and tradition.[6] The older notion that the personal data in Titus, or in the rest of the pastorals, were invented to lend verisimilitude to the writing must be given up. They are too circumstantial and artless to be the work of a writer idealizing or creating a situation. Thus, in the present epistle, a passage like iii. 12–13 is palpably genuine. But it is another question whether other passages can be added to it (*e.g.* i. 1 seq., 5–6, 12–13*a*, 16, iii. 1–7, 15, by Hesse; i. 1, 4, iii. 15, by von Soden; i. 1–6?, iii. 1–7, by McGiffert), in order to reconstruct a more or less independent note from Paul's own pen.

It seems improbable that Titus or any of the pastorals is directed against any one phase of contemporary heresy.[7] The prohibition of marriage (1 Tim. iv. 3) was common to Marcion and Apelles, while the injunction of fasting[8] is attributed to the Encratites (Iren. *Adv. Haer.* i. 28, 1) and to Saturninus of Antioch in Syria (ibid. 1. 24, 3), the latter being also credited with having been the first to introduce a dualism into humanity, which made God send his Saviour to destroy the evil and redeem the good, both classes having been formed by the angels (cf. Titus ii. 11; 1 Tim. iv. 10). The exhaustive discussions on this point (cf. Bourquin, pp. 55 seq.) have led most scholars to the conclusion that no one system of 2nd-century gnosticism is before the writer's mind. He is maintaining Paul's rôle. He makes the apostle prophesy, vaguely of course, the evil tendencies which were to come upon the church; but the internal evidence,

[5] W. E. Bowen, Professor Bartlet (*Apostolic Age*, pp. 178 seq.; cf. also article on PAUL), Lisco (*Vincula sanctorum*, 1900) and Laughlin are the only recent exceptions, and their conjectural schemes are mutually destructive. The common style of the epistles forbids any dispersion of them over a term of years. They stand or fall together, as critics of all schools are practically agreed. The impossibility of placing them within the period of Acts is best known by Hatch, Bourquin (pp. 10–25), Bertrand (23–47) and von Soden.

[6] The historical site for iii. 12–13, as well as for the tradition which forms the setting of the epistle, is probably to be sought in the neighbourhood of Acts xx. 3 (so Krenkel). Clemen dates iii. 12–13 from Macedonia after 2 Cor. x.–xiii., i.–ix., previous to Romans (in A.D. 59).

[7] Essenism, blended with Ebionitism, is the plausible conjecture of Schleiermacher, Neander and Mangold, but the Essenes do not seem to have prohibited marriage so dogmatically.

[8] Asceticism was bound up with the gnostic depreciation of the body. By a natural recoil it produced licentiousness of conduct which the pastorals hotly denounce.

together with the impossibility of placing the epistles later than the first ten or twenty years of the 2nd century, render it impracticable to detect anything except incipient phases of syncretistic gnosticism behind the polemical allusions. It was a gnosticism fluctuating not only in its relation to the Church but in its emphasis upon certain ethical and theosophical ideas. One definite trait is its Jewish character (Titus i. 10; 2 Tim. iii. 16; 1 Tim. i. 7, &c.). The errorists developed speculations and practical theories on the basis of the Old Testament law, which proved extremely seductive to many Christians. But it is difficult to find any homogeneity in the repeated descriptions of this semi-gnostic phase, although now and then (*e.g.* in 1 Tim. i. 7 seq.; Titus i. 14, iii. 9) there are suggestions of the legalism which Cerinthus advocated. The Ophites are said to have not only used myths but forbidden marriage and held that the resurrection was purely spiritual (Lightfoot); this, however, is probably no more than an interesting coincidence, and all attempts to identify the errorists definitely must be abandoned.[1] The early Fathers often indeed identify them with later types of gnosticism, but this cannot be taken as any sure clue to the author's meaning. They naturally found in his prophetic words the anticipation of heresies current in their own age.

Sometimes, as in the cases of the resurrection being allegorized[2] and marriage repudiated,[3] it is feasible to detect distortions or exaggerations of Paul's own teaching, against which the Paulinist of the pastorals puts in a caveat and a corrective. But these somewhat "indiscriminate denunciations are certainly not what we expect from a man like Paul, who was an uncommonly clear-headed dialectician" (McGiffert). They partake of the nature of a pastoral manifesto, which does not trouble to draw any fine distinctions between the principles or motives of its opponents. The method resembles that of the First Epistle of John, for although the errorists attacked in the latter manifesto are not those of the pastorals, and although the one writer eschews entirely the inner authority of the Spirit which the other posits, the same anti-gnostic emphasis on practical religion and stereotyped doctrine is felt in both.

LITERATURE.—Special monographs on Titus have been written by Jerome, Casper Cruciger (*Expositio brevis et familiaris*, 1542), Mosheim (*Erklärung des Briefs an Tit.*, 1779), and Kuinoel (*Explicatio epist. Pauli ad Titum*, 1812). Commonly, however, the epistle has been edited and criticized along with the epistles of Timothy. The ablest recent editions are by B. Weiss (in Meyer's *Commentar*, 7th ed., 1902; full and exact), Wohlenberg (in Zahn's *Commentar*, 1906), and J. E. Belser, the Roman Catholic savant (1907), with which may be ranked Wace's (*Speaker's Commentary*, 1886) and J. H. Bernard's (*Cambridge Greek Testament*, 1899) editions. All these present the conservative position. On the other side, Von Soden's *Hand-Commentar* (2nd ed., 1893) and Franz Koehler's popular commentaries *Die Schriften des N. T.* (1906) are most notable. Brief English notes are furnished by Horton (*Century Bible*, 1901, from Zahn's standpoint) and J. P. Lilley (Edinburgh, 1901). Of the older editions, the most valuable are Heydenreich's (*Die Pastoralbriefe*, 1826–1828), Alford's (3rd ed., 1862), Huther's (3rd ed., Göttingen, 1866), Bisping's (1866), P. Fairbairn's (Edinburgh, 1874), Ellicott's (5th ed., 1883, strong in exegesis) and Knoke's (in Lange's *Bibel-Werk*, 4th ed., 1894), with Riggenbach's (in the Strack-Zöckler *Commentar*, 1897). Editions in English have recently been undertaken in the *International Critical Commentary* (by W. Lock), in the *Expositor's Greek Testament* (by N. J. D. White), and by Sir W. M. Ramsay. For the patristic literature see Wohlenberg (*op. cit.* p. 76).

For the view that a Paulinist was the author, see Schleiermacher, *Über den sogen. ersten Brief des Paulus an den Tim.* (1807), which really opened the modern phase of criticism on all three epistles; Baur, *Die sogenannten Pastoralbriefe des Apostels Paulus* (1835); H. J. Holtzmann, *Die Pastoralbriefe kritisch u. exegetisch behandelt* (1880), an exhaustive treatment; Hilgenfeld, *Zeitschrift für die wiss. Theologie* (1897), 49 seq., 61 seq., 79 seq.; E. Y. Hincks, *Journal of Bibl. Literature* (1897), 94–117; and Renan, *S. Paul* xxiii.–liii., *L'Église chrétienne*, ch. v. The conservative position is maintained with varying confidence by C. W. Otto, *Die geschichtlichen Verhältnisse der Pastoralbriefe* (1860); Bertrand, *Essai critique sur l'authenticité des ép. pastorales* (1888); G. G. Findlay, appendix to Eng. trans. of Sabatier's *L'Apôtre Paul*, pp. 341 seq.; W. E. Bowen, *Dates of Pastoral Letters* (1900); T. C. Laughlin, *The Pastoral Epp. in the Light of one Roman Imprisonment* (California, 1905); and J. D. James, *The Genuineness and Authorship of the Pastoral Epistles* (1906). For general studies, see Schenkel's *Bibel-Lexicon*, iv. 393–402; Sabatier's article in *Ency. des sciences religieuses*, x. 250–259; J. R. Boise, *The Epp. of Paul written after he became a Prisoner* (New York, 1887); Plummer, *Expositor's Bible* (1888); Bourquin, *Étude critique sur les past. épîtres* (1890); Harnack, *Die Chronologie*, 480 seq., 710–711; Moffatt, *Ency. Bib.*, 5079–5096, and W. Lock (Hastings's *Dict. Bible*, vol. iv.). (J. MT.)

[1] Clemen (*Paulus* i. 148) distinguishes broadly between the errorists of 2 Tim. and those controverted in the other two epistles. The former, he argues, are in the last resort libertinists and antinomians; the latter must be regarded as ascetic Judaists.

[2] 2 Tim. ii. 18. Paul's teaching about the believer being already risen with Christ gave a welcome handle to the later Gnostics. The passage in John v. 28–29 seems a correction of the possible inferences which might be drawn from such teaching in Paul and in the Fourth Gospel itself.

[3] Cf. Von Dobschütz, *Christian Life in the Primitive Church* (pp. 261 seq.).

TITUS, FLAVIUS SABINUS VESPASIANUS, Roman emperor from A.D. 79–81, son of the emperor Vespasian, was born on the 30th of December A.D. 40 (or 41). He was educated in the imperial court, and thoroughly accomplished: he could speak Greek fluently and compose verses; he was a proficient in music; he could write shorthand, and imitate handwriting so skilfully that he used to say that he might have been a most successful forger. He was handsome and commanding, and had a vigorous frame, well trained in all the exercises of a soldier. As a young man he served with credit in Germany and in Britain. Soon he had the command of a legion, and joined his father in Syria, where he took an active part in the Jewish War. In 68 he was sent by his father to congratulate the newly proclaimed emperor, Galba; but, hearing of Galba's death and of the general confusion in the Roman world, he returned to Palestine, having in the meantime consulted the oracle of the Paphian Venus and received a favourable answer. In the following year Vespasian, having been proclaimed emperor, returned to Italy, and left Titus to carry on the siege of Jerusalem, which was captured on the 8th of September 70. On his return to Rome, Titus and his father celebrated a magnificent triumph, which has been immortalized by the so-called Arch of Titus. He was now formally associated with his father in the government, with the title of Caesar, and during the nine remaining years of Vespasian's reign he was in fact emperor. He was anything but popular; he had the character of being profligate and cruel. His connexion with Berenice, the sister of the Agrippa of the *Acts of the Apostles*, also created a scandal; both brother and sister followed Titus to Rome, and were allowed to reside in the imperial palace. Public opinion was outraged, and Titus, though he had promised Berenice marriage, felt obliged to send her back to the East. Vespasian died in 79, leaving his son a safe throne and a well-filled treasury. The forebodings of the people were agreeably disappointed, for Titus put an end to prosecutions for high treason, and the *delatores* (informers) were scourged and expelled from the city. He assumed the office of pontifex maximus, in order that he might keep his hands free from blood. He forgave his brother Domitian, who more than once plotted against his life, and having let a day pass without bestowing a present, he exclaimed, "I have lost a day."

Titus, like his father, spent money in adding to the magnificence of Rome. The Flavian amphitheatre (later called the Colosseum) was completed and dedicated in his reign, with combats of gladiators, shows of wild beasts, and representations of some of the great Greek naval battles. He gave the city splendid baths, which surpassed those of Agrippa and of Nero, and supplied the mob with every kind of luxury.

During his reign, in 79, occurred the eruption of Vesuvius which destroyed Herculaneum and Pompeii. The emperor visited the scenes and contributed liberally to the relief of the distressed inhabitants. During his absence a fire raged for three days at Rome, in which the new temple of Jupiter Capitolinus, the library of Augustus, and other public buildings were burnt; then followed a pestilence, and Titus again assisted freely with his purse. Italy and the Roman world were peaceful during his reign. The only fighting was in Britain under Agricola, who in the year 80 carried the Roman arms as far as the Tay. Titus died on the 13th of September 81. The verdict of history is favourable to him, but the general feeling throughout the Roman world was that he had been fortunate in the briefness of his reign.

See Suetonius, *Titus*: Dio Cassius lxvi. 18–26; C. Beulé, *Titus et sa dynastie* (1870); L. Double, *L'Empereur Titus* (1877); Merivale, *Hist. of the Romans under the Empire* (ch. 60); H. Schiller, *Geschichte der römischen Kaiserzeit*, i. pt. 2.

TITUS TATIUS, in Roman legend, the Sabine king of Cures, who waged war upon the Romans to avenge the rape of the Sabine women (see ROMULUS). After various indecisive conflicts the latter, who had become Roman matrons, intervened and prevailed upon the combatants to cease fighting. A formal treaty was then arranged between the Romans and Sabines, whereby Romulus and Tatius were to be joint and equal rulers of the Roman people. Rome was to retain its name and each citizen was to be called a Roman, but as a community they were to be called Quirites (*q.v.*); the Sabines were to be incorporated in the state and admitted into the tribes and curies. After this arrangement had lasted for five years it came to an end by the death of Tatius, who was killed out of revenge by the inhabitants of Lavinium. According to Mommsen, the story of his death, (for which see Plutarch) looks like an historical version of the abolition of blood-revenge. Tatius, who in some respects resembles Remus, is not an historical personage, but the eponymous hero of the religious college called Sodales Titii. As to this body Tacitus expresses two different opinions, representing two different traditions: that it was introduced either by Tatius himself to preserve the Sabine cult in Rome; or by Romulus in honour of Tatius, at whose grave its members were bound to offer a yearly sacrifice. The *sodales* fell into abeyance at the end of the republic, but were revived by Augustus and existed to the end of the 2nd century A.D. Augustus himself and the emperor Claudius belonged to the college, and all its members were of senatorial rank. Varro derives the name from the *Titiae aves* which were used by the priests in certain auguries.

See Livy i. 10–14; Tacitus, *Annals*, i. 54, *Hist.* ii. 95; Dion. Halic. ii. 36–52; Plutarch, *Romulus*, 19–24; Marquardt, *Römische Staatsverwaltung* (1885) iii. 446; Schwegler, *Römische Geschichte*, bk. ix. 3, 14; x. 5.

TITUSVILLE, a city of Crawford county, Pennsylvania, U.S.A., on Oil Creek, about 42 m. S. by E. of Erie. Pop. (1900), 8244, of whom 1573 were foreign-born; (1910 census) 8533. Titusville is served by the Dunkirk, Allegheny Valley & Pittsburg, and the Pennsylvania railways. It has the Benson Memorial library (1904), and in Woodlawn Cemetery there is a monument (erected by Henry H. Rogers in 1902) to Colonel Edwin L. Drake (1819–1880), who here sank the first oil well (69½ ft. deep) in America in August 1859 and who is buried here. Titusville was the principal centre in Pennsylvania of the opposition to the Standard Oil Company; but after 1875, when John D. Archbold (b. 1848), a leader of the independents, became a director of the Standard, few of the Titusville operators remained independent. It was in the Titusville district that the natural gas industry of Pennsylvania was first established about 1872.

There are various manufactures, and in 1905 the value of the factory products was $3,249,890. The first settlement was made here in 1796 by Samuel Kerr and Jonathan Titus (in whose honour the place was named). Titusville was incorporated as a borough in 1847 and was chartered as a city in 1866. On the 5th of June 1892 Oil Creek rose suddenly, overflowed its banks and wrecked many oil tanks along the bottom-lands. A large part of the water was covered with oil, which soon caught fire. About 60 persons were drowned or burned to death, and about a quarter of the city was destroyed.

TIVERTON, a market town and municipal borough in the Tiverton parliamentary division of Devonshire, England, situated amid beautiful scenery at the confluence of the Loman and Exe, 187¾ m. W. by S. of London by the Great Western railway. Pop. (1901), 10,382. The upper town is built on high ground along the left bank of the Exe, and a bridge leads to the lower town, named West Exe. St Peter's church, originally consecrated as a chapel by Leofric, bishop of Exeter, in 1073, is a beautiful Perpendicular building. Its high tower has four stages, each adorned with grotesques; and Greenway's chapel, built in 1517 by John Greenway, a wool merchant of Tiverton, is ornamented with figures minutely carved in stone. Of the original Norman fabric only a doorway remains. Within are some fine carvings, brasses and monuments. Of the castle, founded about 1105 by Richard de Redvers, the banqueting-hall, a tower, the chapel and a 14th-century gateway remain. After serving as the home of the Redvers and Courtenay families, earls of Devon, until the 16th century, the castle was dismantled by Fairfax. Partly rebuilt, it is used as a dwelling-house; while in its gardens an annual race-meeting is held in August. Blundell's grammar school, founded under the will of Peter Blundell, a rich cloth merchant, in 1604, has modern buildings outside the town in Tudor style; and, among others, scholarships at Balliol College, Oxford, and Sidney Sussex College, Cambridge. The number of boys is about 230. The Chilcott Free School was established in 1611, and the Bluecoat Charity School, dating from 1714, was reorganized in 1876 to give secondary education to boys and girls. After the decline of its woollen trade Tiverton became noted for the lace manufacture introduced by John Heathcoat (1783–1861), inventor of the bobbin net frame. There are also breweries, flour-mills, and a large trade in farm produce and livestock. Amicia, countess of Devon, brought a stream of water from Norwood, 5 m. distant. This system was improved in the 19th century. Hannah Cowley, the dramatist (1743–1809), Richard Cosway, the miniature painter (b. 1742) and John Cross, an artist of some celebrity (b. 1819), were natives of Tiverton. The town is governed by a mayor, 6 aldermen and 18 councillors. Area, 17,680 acres.

Tiverton (*Tuyverton*, *Tovretona*) exhibits traces of very early settlement, and is mentioned under the name of Tuyford in the will of King Alfred. In the Domesday survey it appears as a royal manor containing two mills, but it was bestowed by Henry I. on Richard de Redvers, and in 1245 appears as a mesne borough under Baldwin de Redvers, who in that year obtained a grant of a Monday market and a three days' fair at the feast of St James. In 1275 Amicia, countess of Devon, claimed to hold fairs at Tiverton at the feasts of St Andrew and St Giles, and at the translation of St Thomas the Martyr. In 1618 the borough received its first charter of incorporation from James I., instituting a governing body of a mayor, 12 chief burgesses, and 12 assistant burgesses, with a recorder, deputy-recorder, town-clerk and two serjeants-at-mace; a court of record every fortnight on Tuesday; and fairs at Michaelmas and on the second Tuesday after Trinity Sunday, which were kept up until within the last fifty years. The borough also sent two representatives to parliament until disfranchised by the Reform Act of 1885. Cromwell in 1655 changed the market day from Monday to Tuesday. Fresh charters of incorporation from James II. in 1689 and from George I. in 1724 left the style and constitution of the governing body unchanged. Tiverton was an important centre of the woollen trade in the 16th century, and Risdon, writing in 1608, describes it as thronged with rich clothiers, and the Monday market famous for its kersies, known as "Tiverton kersies," while as late as the reign of George II. the town had 56 fulling-mills; but about this time the industry began to decay, and is now extinct.

See *Victoria County History: Devonshire*; M. Dunsfold, *Historical Memoirs of the Town and Parish of Tiverton* (Exeter, 1790); W. Harding, *History of Tiverton* (1845–1847).

TIVOLI (anc. *Tibur*, *q.v.*), a town and episcopal see of the province of Rome, Italy, 18 m. E.N.E. of Rome by road and tramway, 24½ m. by rail, 760 ft. above sea-level. Pop. (1901), 11,610 (town), 12,881 (commune). Tivoli lies on the west of the Sabine Mountains, where the river Anio issues from them, upon a limestone rock above the river. The town on one side overlooks the Campagna di Roma and Rome itself, on the other the deep gorge of the Anio, with its lofty falls, and the environs are very beautiful. The Roman remains are described under the heading of TIBUR. The Villa d'Este, begun in 1549 by Pirro Ligorio for Cardinal Ippolito d'Este the younger (the cardinal of Ferrara), has the finest example of a Renaissance garden in Italy; it was erected on a steep slope, with many terraces, and embellished with numerous fountains, fantastically decorated in stucco, which once formed the background to the splendid collection of ancient statuary formed by the cardinal, but now dispersed (see F. S. Seni, *La Villa d'Este in Tivoli*, Rome, 1902; T. Ashby, in *Archaeologia*, vol. lxi.). The villa contains damaged frescoes by the brothers Zuccari. The register of the see of

Tivoli has documents dating from the 10th century relating to the landed property of the see (L. Bruzza, *Regesto della chiesa di Tivoli*, Rome, 1883), and the municipal archives date from 1450. The castle was erected in 1460 by Pius II. on the site of the amphitheatre; it is now a prison. In November 1826 a flood of the Anio led to a change in its course, and threatened to carry away the town. A new channel, consisting of two parallel tunnels (the Traforo Gregoriano) 290 and 330 yds. long, was therefore made to the north-east in 1826–1835 by Folchi, and on emerging from these the river has a fall of 354 ft. Farther north-west are smaller falls (the *cascatelle*) of that portion of the river which is carried through the town and serves for industrial purposes. Five miles west are the sulphur baths of Acque Albule, which were known to the ancients, and are now frequented by over 40,000 persons annually. The temperature of the water is 75·2° F. The falls in the river afford electric power for lighting Rome and driving its trams, as well as for driving several factories in Tivoli itself. Tivoli is also the centre of an agricultural district, and its olive trees are especially fine.

TLAXCALA, an inland state of Mexico, bounded N.E. and S. by Puebla, and W. by the state of Mexico. Area 1505 sq. m. Pop. (1900), 172,315. Tlaxcala lies on the great central plateau of Mexico and has a mean altitude of about 7000 ft. Several mountains rise in the west and south, culminating in the volcanic peak of Malinche, or Malintzin (14,636 ft.). The state has three railway lines crossing its territory. The capital is Tlaxcala and the principal towns are Chiautempan (about 5000), Calpulalpan, San Antonio, Tlaxco, Huamantla and Barron-Escandon (Apizaco). The state nearly coincides with the ancient Indian republic founded in the 13th century by a branch of the Nahuatlan race, who migrated from the western shores of Lake Texcoco. Though surrounded on all sides by the great Aztec Empire, the tiny republic maintained its independence until the arrival of the Spaniards. The Tlaxcaltecs, or Tlascalans, after a fierce resistance to Cortés in 1519, became efficient allies of the Spaniards and contributed largely to their final success. The present inhabitants are chiefly of this original stock, and retain their language and many ancient customs.

TLAXCALA, a town of Mexico, capital of a state of the same name, on the Atoyac river, 58 m. E. of Mexico city by rail. Pop. (1900), 2715. It is of historic interest in connexion with the conquest of Mexico by Cortés. The state-house is its only fine edifice of a political character, and the old bishop's palace its finest building of a religious character. Of most historic interest, perhaps, is the church of San Francisco, the first erected on the American continent, which still contains the vestments, pulpit, font and cedar ceiling brought from Spain in 1521. The handsome sanctuary over the holy well of Ocotlan, on a hill outside the town, is one of the landmarks of the surrounding country.

TLEMÇEN, a town of Algeria, the capital of an arrondissement in the department of Oran, near the frontier of Morocco, 68 m. by road and 102 by rail S.W. of Oran. It stands 2500 ft. above the sea, on the north slope of the Lella Setta hills, which rise to a height of over 4000 ft. It is the chief town of a wide district exporting olive oil, esparto, corn and flour, wools and Algerian onyx; and has a population of (1906) 24,060. From Tlemçen the railway is continued westward to the Moroccan frontier at Lalla Maghnia, a distance of 44 m.

Among the cities famous in the annals of Arab-Berber, or Moorish, art and civilization, Tlemçen takes high rank. In architectural merits its monuments, though not so extensive, are worthy of comparison with those of Granada. The older walls and towers—there were three ancient lines of fortifications—are in great part destroyed, but a wall built by the French encircles the town.

The various quarters are grouped around the principal mosque—the Jewish to the south-west, the Moorish to the south-east, that of the merchants to the north-east, while the new town with the civic buildings lies to the north-west. Of the sixty-four mosques which existed at the period of the French conquest, several have disappeared. The great mosque (Jamaa-el-Kebir) has a brick minaret 112 ft. high, adorned with marble columns, and cased with mosaic of the most varied designs; a fountain of alabaster—of the kind known as Algerian onyx—stands in the alabaster-paved inner court; and 72 columns support the arches of the interior. This mosque was built A.D. 1136 to replace a much older building. The *mihrab* is finely ornamented with arabesques. The mosque of Sidi Ahmed bel Hassan, usually called Abul Hassan, built A.D. 1298, now transformed into a museum of antiquities, has two series of arches, which rest on alabaster pillars. The courts are ornamented by sculptures of great beauty and richness; the delicately-carved cedar ceiling bears traces of polychromatic painting. The exterior has been altered in French taste. Among the antiquities preserved in the museum are the epitaph of Boabdil, the last king of Granada, who died at Tlemçen in 1494, and the standard cubit measure—in marble—used in the *Kissaria*, bearing date A.H. 728 (1328). The mosque of El-Halawi (the Sweetmeat Maker), dating from 1353, is outside the walls of the town. It has eight magnificent columns of Algerian onyx, with richly sculptured capitals. The ceiling of cedar is richly carved, and there is a fine colonnade on each side of the court. The minaret is decorated with mosaics. The military authorities occupy the Meshuar or citadel, built in 1145, which separates the Jewish and Moorish quarters and was formerly the palace of the rulers of Tlemçen. Only the minaret of the mosque, dating from the 14th century, and the battlemented wall, flanked by two towers, remain of its former magnificence. The vast basin (*sahrij*) under the old walls, now dry (720 ft. in length, 490 in width and 10 in depth), was apparently made for naval exhibitions. At one period barracks of the spahis occupied all that remains of the *Kissaria*, the place of residence of European merchants from Pisa, Genoa, Catalonia and Provence. The barracks have been cleared away and a covered market made in the upper part of the *Kissaria*. The ancient college (medressa) where many learned Arabs taught—of whom Ibn Khaldūn, author of a *History of the Berbers*, may be mentioned—has entirely disappeared. The church erected by the French is a fine building in the Byzantine style. Besides the large trade carried on there are native manufactories of cloth, carpets and leathern articles. A special manufacture is that of red shawls, used throughout the department of Oran by Jewish women when in mourning.

Sidi Bu Medin.

In the immediate neighbourhood of the modern Tlemçen are numerous remains of the fortifications of Agadīr (*vide infra*), and the minaret of the mosque, a beautiful tower dating from the 13th century, the lower part of which is built of large hewn stones from the Roman Pomaria. More noteworthy, however, are the ruins of Sidi Bu Medin and of Mansura. Sidi Bu Medin (more properly El Eubbad) is a little over a mile south-east of Tlemçen. It was founded A.D. 1337 by Ali V., the first of the Beni-Marīn (Marinide) sultans who ruled Tlemçen, and commonly called the Black Sultan. The ruins of a small building, conjectured to be a palace of Sultan Ali, which commands a beautiful view, were excavated in 1881. The *kubba* or tomb of Sidi Bu Medin, near the palace, is held in great veneration by the Arabs. The roof and walls are covered with arabesques, and the legend *El-Mulk Lillah*, "the kingdom is God's," is repeated again and again. The saint himself was born at Seville A.D. 1126, and died near Tlemçen in his 75th year; his disciple Sidi Abd-es-Selam of Tunis lies near him. The adjacent mosque is a beautiful specimen of Moorish art. The large double doors of cedar wood, covered with bronze showing a geometric interlaced pattern, have been compared with those of Ghiberti at the Baptistery of Florence. The mosque is divided by columns into five aisles. Delicate lacework extends from the spring of the arches to the roof. The tile mosaics are believed to have come from Morocco. The medressa is a building resembling the mosque.

Mansura.

Mansura, which is about 1½ m. west of Tlemçen, owes its foundation to the attempts of the Beni-Marīn rulers of Morocco to extend their sovereignty. The Amir Abu Yakub Yusef besieged Tlemçen in the early years of the 14th century. The siege lasted eight years, and Yusef turned his camp into a walled city. The siege being raised, El Mansura (the victorious), as the new city was called, was abandoned. It was reoccupied when (1335) Ali V. renewed the siege, which this time proved successful. On the expulsion of the Marinides in 1359 Mansura was finally deserted. Besides the walls and towers, and the minaret of the mosque, little remains of Mansura, of which Ibn Khaldūn has left a contemporary and graphic sketch. The minaret, notwithstanding that one side and parts of two other sides have perished, is one of the finest mosque towers in existence. It is 125 ft. high, and is built of hewn stone. The arches are circular or pointed. The upper part of the tower is ornamented with green and blue tiles and the entrance arch is beautifully carved. An inscription records that the tower was built by order of Abu Yakub Yusef. Of the rest of the mosque only the outer walls remain. It is about 320 ft. long by 200 wide and was divided by magnificent marble columns into thirteen aisles. Excavations made by the French brought to light some of these columns, which are now in the museums of Tlemçen and Algiers.

History.—A Roman town, Pomaria, occupied a site east of the present town. It derived its name from the abundance and luxuriance of the apple, pear and other fruit trees in the neighbourhood. The Roman town was ruined in the period following the Vandal invasion, and at the time of the Arab conquest appears to have been deserted. Many inscriptions of the Christian era have been found, some as late even as the 7th century. The site was purchased from the Zenata Berbers, in the 8th century, by Idris-bin-Abdallah, who began the building of a new city named Agadir (Berber, the fortress). Idris, founder of the Idrisite dynasty of Fez, left his brother Suleiman in possession of Agadir, and the city was ruled by the Beni-Suleiman until 931, when it fell into the hands of the Fatimites. From the Fatimites it passed into the possession of the Beni-Yala, of the Beni-Ifren branch of the Zenata Berbers, who held it as vassals of the Omayyad rulers of Spain. In 1080 the Almoravide sovereign Yusef ibn Tashfin, after besieging and sacking Agadir, built a new town on the site of his camp. The new town, called Tagrart, became the commercial quarter, whilst Agadir remained the royal residence. The two towns when united received the name of Tlemçen. The Almoravides reigned sixty-five years, when, after holding Agadir four years against the enemy, they were overcome by the Almohades, who massacred the inhabitants, rebuilt, enlarged and repeopled the ruined town, and built a wall (1161) surrounding the double town. In 1248 Tlemçen was captured by Abu Yahia Yarmorasen (Ghamarasan) who was chief of the Zenata tribe of Berbers and claimed descent from the Caliph Ali. Yarmorasen, who died in 1282, founded the dynasty of the Abd-el-Wahid, who ruled the greater part of what now constitutes Algeria. Under their sway Tlemçen flourished exceedingly. The presence of Jews and Christians was encouraged and the Christians possessed a church. The bazaar of the Franks (*kissaria*) was a large walled enclosure, the gates of which were closed at sunset. As many as 5000 Christians lived peaceably in Tlemçen, and the Sultan included in his army a Christian bodyguard. In 1337 the power of the Abd-el-Wahid was temporarily extinguished by the Marinide sultans of Morocco. They left some fine monuments of the period of their ascendancy, which lasted twenty-two years. Once more, under the Abd-el-Wahid, now known as the Beni-Zeiyan, from 1359 to 1553, Tlemçen enjoyed prosperity. It had a population reputed to number 125,000, an extensive trade, a brilliant court and a powerful army. The Spanish occupation of Oran (1509) struck a fatal blow at the European commerce of the town. The Beni-Zeiyan, after the capture of Algiers in 1516 by the corsair Barbarossa (*q.v.*) gradually lost their territory to the Turks, while Tlemçen itself for forty years became tributary to the Spanish governor of Oran. In 1518 the town was held for a short time by Arouj Barbarossa, but Arouj was killed in a fight with the Spaniards. It is said that, while master of the town, Arouj caused twenty-two of the Zeiyan princes to be drowned in the *sahrij*. In 1553 the Turks under Salah Rais, pasha of Algiers, captured Tlemçen and the Sultanate of Tagrart, as it was still frequently called, came to an end. Under the Turks the town ceased to be of any importance. When the French entered Algeria the sultans of Morocco were disputing the possession of Tlemçen with the Kuluglis, who fought first for themselves and afterwards for France. In 1835 Abd-el-Kader, on whose appearance the Moors retired, sought to re-establish the ancient empire of Tlemçen, but he retreated before General Clausel in 1836. The treaty of the Tafna (1837) gave Tlemçen to Abd-el-Kader, but, war being renewed in 1842, Tlemçen was definitely occupied by the French, under whom it has prospered.

The Sultanate of Tlemçen.

The commune of Tlemçen, which includes a number of villages near the city, had a population (1906) of 39,757, and the arrondissement, which includes nine communes, 149,467.

See *Les Monuments arabes de Tlemçen*, by William Marçais and Georges Marçais (Paris, 1903). This accurate and finely-illustrated work, one of the publications of the *Service des monuments historiques de l'Algérie*, cites the principal works dealing with Tlemçen, and gives a critical estimate of their value. (F. R. C.)

TOAD, a name commonly applied, in contradistinction to "frog," to tailless batrachians of stout build, with more or less warty skin. Thus, of the two closely related discoglossid genera *Bombinator* and *Discoglossus*, the former is called a toad and the latter a frog. But the true toads are the Bufonidae, arciferous batrachians with dilated processes to the sacral vertebra and without any teeth in the jaws. The type of the family is our common toad, *Bufo vulgaris*, and round it cluster a large number of species of the same genus, and the smaller genera *Eupemphix*, *Pseudophryne*, *Nectophryne*, *Nectes*, *Notaden*, *Myobatrachus*, *Rhinophrynus* and *Cophophryne*. That the shape of the body is not a safe guide in judging of the batrachians is shown by certain species, such as *Bufo jerboa*, which in its slender form and extremely long limbs surpasses the typical frogs, whilst on the other hand, some true frogs (*Rana*), adapted to burrowing habits, are absolutely toad-like. The Bufonidae include terrestrial, burrowing, thoroughly aquatic and arboreal types; *Rhinophrynus*, of Mexico, may be described as an ant-eater.

The genus *Bufo* embraces about 100 species, and is represented in nearly every part of the world except the Australian region and Madagascar. Two species are found in the British Isles: the common toad, *Bufo vulgaris*, and the natterjack, *Bufo calamita*. The former is found almost everywhere; the second, which differs in its shorter limbs with nearly free toes (which are so short that the toad never hops but proceeds in a running gait) and in usually possessing a pale yellow line along the middle of the back, is local in England, the south-west of Scotland, and the west of Ireland; it is further remarkable for the very loud croak of the males, produced by a large vocal bladder on the throat which, when inflated, is larger than the head. Toads lay their eggs in long strings, forming double files in straight, jelly-like tubes.

A small toad, *Pseudophryne vivipara*, recently discovered in German East Africa, has proved to be viviparous, this being the only such instance known among tailless bactrachians.

TOADSTOOL, the popular name for fungi which more or less resemble mushrooms, but are either poisonous or worthless as food.

TOAST, a slice of bread scorched brown on the two surfaces by the heat of a fire. The word was borrowed from the O. Fr. *toste*, Lat. *torrere*, *tostum*, to scorch, burn. It was formerly the custom to have pieces of toast floating in many kinds of liquor, especially when drunk hot. It is said to be from this custom that the word is used of the calling upon a company to drink the health of some person, institution or cause (see Health).

TOBACCO, the name (see below) for the leaves of several species of *Nicotiana* (nat. ord. Solanaceae), variously prepared for use as a narcotic. While it is principally manufactured for smoking, a large amount is also prepared for chewing, and, to a more limited extent, it is taken in the form of snuff. Under one or other of these forms the use of tobacco is more widely spread than is that of any other narcotic or stimulant.

History.—Although the fact has been controverted, there cannot be a doubt that the knowledge of tobacco and its uses came to the rest of the world from America. In November 1492 a party sent out by Columbus from the vessels of his first expedition to explore the island of Cuba brought back information that they had seen people who carried a lighted firebrand to kindle fire, and perfumed themselves with certain herbs which they carried along with them. The habit of snuff-taking was observed and described by Ramon Pane, a Franciscan who accompanied Columbus on his second voyage (1494–1496), and the practice of tobacco-chewing was first seen by the Spaniards on the coast of South America in 1502. As the continent of America was opened up and explored, it became evident that the consumption of tobacco, especially by smoking, was a universal and immemorial usage, in many cases bound up with the most significant and solemn tribal ceremonies.

The term tobacco appears not to have been a commonly used original name for the plant, and it has come to us from a peculiar instrument used for inhaling its smoke by the inhabitants of

Hispaniola (San Domingo). The instrument, described by Oviedo (*Historia de las Indias Occidentales*, Salamanca, 1535), consisted of a small hollow wooden tube, shaped like a Y, the two points of which being inserted in the nose of the smoker, the other end was held into the smoke of burning tobacco, and thus the fumes were inhaled. This apparatus the natives called "tabaco"; but it must be said that the smoking pipe of the continental tribes was entirely different from the imperfect tabaco of the Caribees. Benzoni, on the other hand, whose *Travels in America* (1542–1556) were published in 1565, says that the Mexican name of the herb was "tabacco."

The tobacco plant itself was first brought to Europe in 1558 by Francisco Fernandes, a physician who had been sent by Philip II. of Spain to investigate the products of Mexico. By the French ambassador to Portugal, Jean Nicot, seeds were sent from the Peninsula to the queen, Catherine de' Medici. The services rendered by Nicot in spreading a knowledge of the plant have been commemorated in the scientific name of the genus *Nicotiana*. At first the plant was supposed to possess almost miraculous healing powers, and was designated "herba panacea," "herba santa," "sana sancta Indorum"; "divine tobacco" it is called by Spenser, and "our holy herb nicotian" by William Lilly. While the plant came to Europe through Spain, the habit of smoking was initiated and spread through English example. Ralph Lane, the first governor of Virginia, and Sir Francis Drake brought with them in 1586, from that first American possession of the English crown, the implements and materials of tobacco smoking, which they handed over to Sir Walter Raleigh. Lane is credited with having been the first English smoker, and through the influence and example of the illustrious Raleigh, who "tooke a pipe of tobacco a little before he went to the scaffolde," the habit became rooted among Elizabethan courtiers. During the 17th century the indulgence in tobacco spread with marvellous rapidity throughout all nations, and that in the face of the most resolute opposition of statesmen and priests, the "counterblaste" of a great monarch, penal enactments of the most severe description, the knout, excommunication and capital punishment.

Botany.—There are about fifty species of *Nicotiana*, nearly all of which are natives of America. Few, however, are of economic importance. The great bulk of the tobacco supply is derived from

FIG. 1.—Flowering Top of *N. Tabacum.*

N. tabacum, the Virginian tobacco, a native of some part of Central or South America and now cultivated in almost all temperate and warmer countries. It is a coarse rank-growing annual, with a simple, unbranched, cylindrical stem which attains a height of 6 ft. and upwards, terminating in a panicle of pink or rose-coloured flowers and an elongated corolla tube (fig. 1). The plant has alternate, simple, oblong-lanceolate leaves, those at the lower part of the stem being slightly stalked, and of large size, reaching to 2 ft. in length, while the upper are semi-amplexicaul and of variable outline. The seeds are brown in colour, with a rough surface, of minute size, and exceedingly numerous; as many as 1,000,000 may be produced by a single plant. The whole of the green parts of the plant are covered with long soft hairs which exude a viscid juice, giving the surface a moist glutinous feeling. The hairs are multicellular, and of two kinds, one branching and ending in a fine point, while the other, unbranched, terminates in a clump of small cells. Stomata occur on both surfaces of the leaves, and, with the peculiar hair structure render the microscopic appearance of the plant highly characteristic.

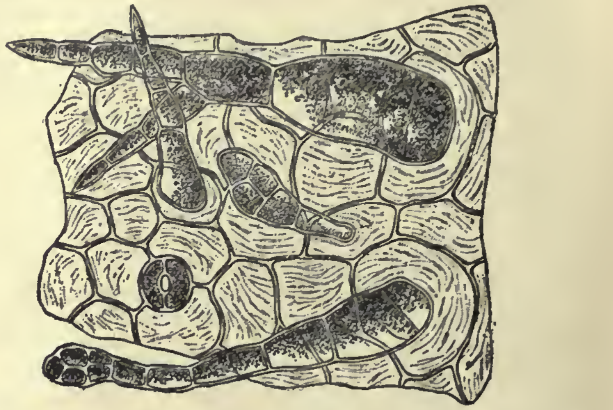

FIG. 2.—Microscopic Structure of Tobacco Leaf.

From this species the tobaccos of Cuba, the United States, the Philippine Islands and the Latakia of Turkey are derived, and it is also largely cultivated in India; the variety *macrophylla* is the source of the Maryland tobaccos. *N. persica*, Persian tobacco, the source of the famous Shiraz tobacco, is regarded as only a variety of *N. tabacum*, and an introduction from America. East Indian, or Green, tobacco is the product of another species, *N. rustica*, a smaller plant with a much-branched stem and greenish-yellow flowers with a short, broad tube. It is a native of Mexico, and now widely cultivated in southern Germany, Hungary and the East Indies.

Cultivation.—Tobacco is cultivated in localities scattered over almost the whole world, ranging as far north as Quebec, Stockholm and the southern shores of Lake Baikal in one hemisphere, and as far south as Chile, the Cape of Good Hope and Victoria in the other. Whilst, however, the plant adapts itself to a great variety of climatic conditions and will grow on almost all kinds of soil, the flavour and quality of the produce are profoundly affected by variations in these two factors. Very slight differences in climate appear to cause very great differences in the quality of the tobacco, and ordinary meteorological records are of little use in determining the suitability or not of a region for a particular kind of leaf; this essential point must be determined by experiment. In general, tropical and semi-tropical conditions as to temperature, with a comparatively dry climate, give the best results.

Given suitable climatic conditions, the type of tobacco produced is determined mainly by the soil, and particularly by its mechanical or physical condition. Speaking generally, clay soils retentive of moisture produce heavy-cropping tobaccos which cure to a dark brown or red colour. Sandy soils produce tobaccos with a thin leaf, curing to a yellow or bright red colour. In the same locality, *i.e.* under the same climatic conditions, quite different kinds of tobacco may be produced in direct relation to the character of the soil. Thus the bright yellow tobacco used for cigarettes, &c., is largely produced in Virginia and N. Carolina on a loose porous sand, which must be at least a foot deep, and contains usually about 8% of clay; this sand is underlaid by a clay subsoil, and, as Mr Milton Whitney points out in *Tobacco Soils* (U.S.A. Dept. of Agriculture, Farmers' Bulletin, No. 83), this clay is the same as that on which the heavy manufacturing and export tobacco is grown. Where the clay is exposed on the surface the heavy type of tobacco is produced, and bright tobacco where the clay is covered by from 12 to 20 in. of sand. Tobacco soils should be well drained and contain a large percentage of humus.

Tobacco being cultivated over such a large area of the world, under very varying climatic conditions, and by many different races of mankind, the methods employed in its production naturally differ very considerably. As the United States of America produce more tobacco than any other country it will be best to deal generally with conditions there and to refer to marked differences in dealing with production in other countries.

The seed is sown in nursery beds, and the plants set out in the field later. Tobacco seeds are very small, and it is estimated that about 300,000 to 400,000 seeds go to the ounce. Allowing for those which fail to germinate (perhaps 25%), loss in transplanting, weak and backward plants, &c., one ounce of seed should yield about 40,000 plants.

The greatest possible care is bestowed on the preparation of the seed bed—it must have good, very rich soil in fine tilth, be protected from winds, and yet well exposed to sunlight; the southern or south-eastern slope of an open place in a forest is often selected. Hot beds are made when necessary. A bed with an area of about 50 sq. yds. is adequate for 1 oz. of seed. To destroy the seeds, &c., of weeds, and the larvae of insect pests, a fire is often lighted, kept from the ground itself by intervening wood logs, or the seed-bed is thoroughly steamed. After this treatment the upper 2 or 3 in. of soil are well pulverized, and fertilizers added, usually, to prevent reintroduction of seeds of weeds, in the form of guano or chemical manures. The seed is now set; usually it is thoroughly mixed with a relatively large quantity of fine ashes, sand or meal, to facilitate thin and even sowing, and the surface of the bed is afterwards lightly brushed over with a broom; it is very important to avoid burying the seed at all deeply; a light covering of cloth or muslin, raised on short sticks, is often stretched over the bed. Great care is necessary in attending to the watering of the young and delicate seedlings, which are ready for transplanting in from fifty to sixty days after sowing. They must be well hardened off before being set out in the open.

The land for their reception must be thoroughly well tilled and manured. If moist, ridges are formed about 3 to 4 ft. apart; the distance apart in the rows varies greatly with various types of tobacco: 3 ft. is the normal for ordinary manufacturing and smoking tobaccos, 1 to 1½ ft. for Cuba and Sumatra types. Cigar tobaccos become coarse if planted too widely. An acre of tobacco planted 3 ft. by 15 in. will contain 11,600 plants and 3 ft. 6 in. by 15 in., 10,000 plants. During the transplanting, preferably done on cloudy days or during light rains, the plants must be handled very carefully; machines are now available which can set out and water plants over from two to six acres in a working day.

After transplanting the crop takes about another sixty days to mature, *i.e.* about 120 days in all from the date the seed was sown. During this period, until the plants begin to ripen, the tilth is maintained and weeds checked first by horse cultivators or horse-hoes, and, as the plants increase in size, by hand labour. When the plants show signs of flowering they are "topped" to prevent seed formation, the terminal buds being removed, and only a certain number of leaves left on each plant to ripen. This operation requires experienced judgment to decide when it should be done; the number of leaves to be left varies with the variety and vigour of the plant, the nature of the soil, climate, seasons and particular use for which the crop is intended. The product from plants which have not been topped is of little value. In the U.S.A., in the cigar tobacco district, fifteen to twenty leaves are often left on each plant, and of manufacturing tobaccos only ten to twelve leaves. As one result of the topping, suckers are usually formed; these also must be removed, although, *e.g.* in Florida, vigorous suckers are sometimes allowed to remain when the plant is cut, and produce a "sucker crop" inferior in character to the first or principal crop, but still serviceable.

The leaves now ripen, indicated by a change from a dark to lighter green, and by the appearance of yellow spots. Ripening is complete in about 35 days after topping or about 155 days after sowing. A ripe leaf easily cracks or shows a crease when folded between the fingers. The leaves on a plant decrease in age from below upwards, and all are not ripe at exactly the same time. In high quality tobaccos the leaves are "primed" or picked singly as they ripen, but in the great bulk of American tobaccos the whole plant is cut close to the ground when the middle leaves are about ripe. In either case leaves should not be gathered when wet with dew or rain, or in very hot sunshine; the afternoon is usually the best time. The next step is to remove the harvested crop to the drying-shed; primed leaves are placed at once in shallow baskets or boxes, and when under cover are strung on string or on wire and hung up on laths in the barn. Cut plants are allowed to wilt, or become flaccid, before removal from the field, to prevent injury to the turgid leaves. These cut plants may be laid in rows on the ground to wilt, or spitted on long rods or laths supported on trestles, or placed on special drying racks. When sufficiently wilted they are hauled to the barn and hung up there on the same laths on which they were placed in the field.

Cultivation under Shade.

A very interesting development of quite recent years is that of growing some valuable cigar tobaccos under artificial shade. Sumatra produced the best cigar wrappers of the world, and efforts to cultivate Sumatra tobacco in Florida under apparently suitable conditions of climate and soil were not successful. It was noticed, however, that if the tobacco was grown under the shade of trees the character of the leaf was improved. Artificial shading, first by laths, and later by cheese-cloth, both supported on posts, was then resorted to with eminently satisfactory results. The U.S.A. Department of Agriculture, in co-operation with local growers, devoted a great deal of attention and money to the problem, and Sumatra tobacco of very high quality is now produced in Florida and Connecticut. The yield of leaf is often much increased, the plants are protected from the weather, and the enhanced value of the crop much more than repays the very considerable expense involved in artificially shading whole fields. So successful have the results been that American-grown tobacco of the Sumatra type is now exported even to Cuba.

Important changes take place in the tobacco leaf from the time it is cut until the finished product is ready for consumption. These may be all placed under curing, but it is usual to recognize three stages: (1) curing proper; (2) fermentation; and (3) ageing.

Curing.

Sun curing, now but little practised in the United States, is the simplest method. The wilted tobacco is suspended on racks in the sun. Great care is necessary to protect it from rain, and it must if necessary be placed in a barn in which fires may be required during wet weather. This method is employed in a portion of Virginia and results in a very sweet chewing tobacco.

Air curing is essentially similar to sun curing. The tobacco is hung in a barn in which there is a free circulation of air during dry weather. Artificial heat may be resorted to in bad weather; in the States, cigar tobaccos and "White Burley" are usually cured in this way. The process takes about six weeks.

In fire curing the tobacco is hung in the barn, and, after it has become of a rich yellow colour, slow fires, producing a gradual increase in temperature up to about 150° F., are lighted on the floor and maintained for four or five days. The firing must be repeated at intervals as the leaves become soft again. A considerable portion of the tobacco exported to England and Africa is fire-cured.

In flue curing, also known as the Virginian cure, fires are set outside the barn, and the heat led in iron pipes or flues, into the building are under the suspended tobacco, which is placed there quite fresh from the field. The temperature is raised, during three to five days, from about 90° F. to 140° F. for primed leaves, or 160° to 175° F. for tobacco on the stalk. The process, which requires great judgment and care, results in the bright yellow leaf so largely used for pipe tobacco, cigarettes and chewing tobacco. In a modification of this method, known as the Kentucky cure, large barns are used, the temperature is not raised above 100° F., and the process occupies from four to six weeks. By whichever way treated, the tobacco-leaf after curing is brittle and cannot be handled without crumbling to powder. The contents of the barn are therefore left till moist weather occurs, and then by the admission of atmospheric air the leaf blades absorb moisture and become soft and pliant. In this condition the leaves are stripped from the stems and sorted into qualities, such as "lugs," or lower leaves, "firsts" and "seconds." These are made up into "hands," or small bundles of from six to twelve leaves. Each bundle is tied round with a separate leaf, and in this condition the tobacco is ready for bulking for fermentation.

Fermentation.

The tobacco, whether in bundles, hands or separate leaves, is piled up or bulked on the floor in a barn into a solid stack to the height of 5 or 6 ft. Within this stack a process of fermentation is quickly set up, and the temperature of the mass rises steadily till it reaches about 130° F. Great care is now taken to prevent overheating and to secure the uniform fermentation of all the tobacco. The pile is from time to time taken down and rebuilt, the tobacco from the top going to the bottom and that exposed at the edges being turned in to the centre. In from three to five weeks the fermentation should be sufficiently carried out, and the leaves then have a nice uniform brown colour. Dark-coloured leaves are produced when the temperature is allowed to mount higher than when light leaves are required. Fermentation is essentially a chemical process due apparently to the presence of enzymes, developed in the leaf during the earlier curing stages. The view has been put forward that fermentation is due to the activity of bacteria, distinct types occurring in various tobaccos, but the balance of evidence is against it. On the bacterial theory it was thought possible to inoculate a poor tobacco with, say, the special bacteria present in Cuban tobacco, and so give the product the aroma and other good qualities of the more valuable tobacco. When fermentation is completed the tobacco is graded, an operation carried out very carefully in the case of the better cigar tobaccos, and packed for export, cigar tobaccos in bales, and other kinds in hogsheads. It is then kept at a moderate and fairly uniform temperature in a warehouse, when, although there is no marked outward change, the tobacco becomes more mellow. Two years are usually required for ageing, but some tobaccos are kept for four or five years before being manufactured.

An artificial aroma is sometimes given to tobaccos, especially for the "fillers" of cigars, by saucing or treating the leaves with a solution containing an infusion of fine quality tobacco stems, rum, sour wine and various flavouring materials such as oil of aniseed, tincture of valerian, powdered cloves, cinnamon and liquorice.

Pests and Diseases.—Tobacco, like other cultivated plants, is subject to attack by various pests and diseases, but fortunately these are less destructive than with many crops. On the other hand, comparatively trivial incidents do more harm to a relatively delicate plant like the tobacco than to more robust plants.

The "tobacco flea-beetle" (*Epitrix parvula*, Fabr.) is a small active beetle, the larvae of which attack the roots, while the adult beetles eat holes in the leaves. The latter is the more serious, as in addition to the actual damage done by the beetle the holes afford entrance to fungus spores, &c. Under the name "horn worms" are included the larvae or caterpillars of species of *Protoparce*. These comparatively large and voracious animals, when abundant, do great damage by eating the leaves. Other caterpillars, "budworms" (*Heliothis*, spp.), attack the buds or burrow into the seed-pods. Seedling plants of tobacco, like many other crops, are liable to attack by "cut worms," the caterpillars of species of *Peridromia* and *Agrotis*. "Plant bugs," which suck the juice of the leaves, have been recorded as serious enemies in some parts of the world. Recently, shade-grown tobacco in some localities has suffered considerably from the attacks of small sucking insects known as thrips, which produce "white veins" in the leaf. White vein may also be induced by other causes besides the attacks of thrips.

Stored tobacco is liable to be attacked and ruined by the "cigarette beetle," a cosmopolitan insect of very varied tastes, feeding not only on dried tobacco of all kinds, including snuff, but also on rhubarb, cayenne pepper, tumeric, ginger, figs and herbarium specimens. Other beetles, such as the rice weevil (*Calandra oryza*), also attack dried tobacco.

The fungoid diseases of tobacco are comparatively unimportant; there are, however, some diseases of obscure origin which at times cause considerable damage. "Mosaic disease" is the name given to a condition in which the leaves are more or less sharply differentiated into light and dark green patches. The matter has been fully investigated by Mr A. F. Woods (Bulletin No. 18, Bureau of Plant Industry, U.S. Department of Agriculture), who attributes it not to any specific parasite but to a disturbance of the normal physiological activity of the cells.

"Frog's eye," or "leaf spot," denotes the occurrence of small white specks on the leaf. This disease is probably bacterial in origin. Wind and hail may break plants or damage leaves, especially if required for wrapper purposes. The provision of wind breaks is the only effective remedy.

Diseases which occur in curing are important. Excessive humidity causes small dark spots to appear; these become confluent and the whole leaf may become dark and decay. Various names are given, such as "pole burn," "pole sweat," "house burn." The disease is checked by raising the temperature above 110° F., and reducing the humidity of the barn. Stem rot, due to a mould (*Botrytis* sp.), occurs in wet weather. Too rapid drying of the outer tissue of the leaf leads to the formation of "white veins," which injure leaves required for wrapper purposes, otherwise it is not important. Another defect arising during curing and fermentation is the efflorescence of salts on the surface, a phenomenon known as "saltpetre"; light brushing and spraying with a weak solution of acetic acid are effective remedies.

Improvement by Selection.—Careful examination of a large number of individuals of one variety growing under similar conditions reveals differences in such characters as number of leaves per plant, the size and shape of the leaves, tendency to form suckers, time of maturing and resistance to disease. Other tests show variability in burning quality, elasticity of leaf, texture, taste, &c. The United States Department of Agriculture has closely investigated this important question and the results attained are brought together by Messrs H. D. Shamel and W. W. Cobey in *Tobacco Breeding* (Bulletin 96, Bureau of Plant Industry, 1907). No crop, it is pointed out, responds so readily to breeding as tobacco, or deteriorates more rapidly, as regards both yield and quality, if neglected. The variations are classified as: (1) Variation in type due to crossing, change of soil and climate, especially, for example, when seed from the tropics is introduced to temperate regions. (2) Variations within the type, due to natural tendency to vary, local conditions and maturity of seed. When Cuban tobaccos were first introduced into Florida, the type broke up, but by carefully selecting the best plants and using them only as sources of seed for later crops, a good type was obtained. The tobacco flower is fortunately perfectly self-fertile, and by enclosing the flowers of selected plants in paper bags, so as to exclude all possibility of hybridization, progeny true to the type of the mother plant can be obtained.

No attempt should ever be made to raise large crops of tobacco from imported seed, but only a small crop, and the seed of the selected plants should be used for future propagation. In selection work the grower must keep definitely in view the special market requirements for the kinds of tobacco he is producing. Thus for wrapper tobaccos, amongst other points a broad, rounded leaf, which will yield perhaps eight wrappers, is much more valuable than a narrow pointed leaf which yields perhaps only four. Plants may be found growing side by side, the one with broad leaves, the other with narrow, but by selection the broad type can be perpetuated and gradually improved.

Hybridization can also be readily controlled in the case of tobaccos, and in this connexion it is useful to note that, if pollen is desired of some variety growing at a distance, it will retain its vitality for several weeks if kept perfectly dry, and so can readily be sent by post from one place to another. Another favourable feature is the fact that a single capsule contains from 4000 to 8000 seeds, and one tobacco plant may easily produce from 500,000 to 1,000,000 seeds.

Production.

United States.—Tobacco cultivation dates in the States from the very early years of the 17th century, when it was taken up in Virginia. A general description has already been given of the methods of cultivation and preparation. In 1906 the total area under tobacco in twenty-five states was 796,099 acres, and the production 682,428,530 lb, valued at about £13,500,000. The principal tobacco-producing states, with the approximate value of their crops, were: Kentucky, £3,885,400; Ohio, £1,706,600; North Carolina, £1,396,153; Wisconsin, £1,342,600; Virginia, £1,206,309, Pennsylvania, £979,550; Connecticut, £883,184; Tennessee, £511,035; Florida, £330,750; New York, £244,053, and Maryland, £241,046. The average yield per acre in the States as a whole in 1906 was 857·2 lb. New Hampshire had the highest average, 1785 lb per acre, and Mississippi the lowest, 440 lb.

The successful production of cigar tobaccos from Cuban and Sumatran seed was a development of the late 19th century.

Perique tobacco is worthy of special notice. This famous tobacco is produced only at Grand Points in Louisiana. Great care is given to the cultivation, and damp atmospheric conditions are desirable during the ripening stages. The leaves, when stripped from the stalks, are made into rolls and subjected to great pressure, which is released daily to allow the leaves to absorb their expressed juice. To the chemical changes, mainly oxidation, which go on in this juice while it is exposed to the air, the characteristic aroma and flavour of Perique tobacco are mainly due.

Cuba.—Tobacco is the second industry of the country, the value of the crop being surpassed only by that of sugar. The cultivation was formerly a monopoly of the Spanish crown, but from 1817 payment of a tax, usually heavy, has been the only restriction. The superiority of Cuban tobaccos in flavour and aroma, especially for cigar fillers, has long been recognized, but exactly to what conditions these qualities are due is not fully known. The leaf known as "Vuelta Abajo," produced in the province of Pinar del Rio, is perhaps the best cigar leaf of the world. The other tobacco-producing provinces in order of importance are Havana, Santa Clara and Santiago de Cuba. The crop is mostly grown in the open, air-cured and carefully fermented. Cuban tobacco is grown as a "winter" crop, the summer months being those of high rainfall. Cultivation under shade was recently tried with satisfactory results; "166·65 acres cultivated under cheesecloth produced in 1903 10 bales of wrappers and 1·5 bales of fillers of tobacco per acre, the output under the old system having been 4·5 bales of tobacco per acre of which only 10% represented wrappers of good colour" (Diplomatic and Consular Report on Cuba, 1904, No. 3522).

Mexico is an important tobacco-producing country, and Mexican leaf is largely used in Europe for cigar wrappers and other purposes. Mexican tobacco approximates more or less closely to that of Cuba, and is cultivated and prepared in very similar ways.

France.—Tobacco cultivation is an important industry, and the home production is carried out under government supervision. In 1905, 53,750 planters cultivated 39,439 acres, and the total crop amounted to 61,614,900 lb, of the approximate value of £2,000,000. The variety grown is usually of the Virginia type, and the leaf is coarse, dark and heavy, and suited to the manufacture of plug and snuff.

Germany.—The chief tobacco-producing divisions are Baden and Alsace. The leaf is of medium size, heavy, and is mainly used in the manufacture of cigars.

Hungary produces tobacco of a rich, dark brown colour, useful for cigars, and also a small, bright yellow leaf, of value as a cigarette and pipe tobacco.

Russia.—In northern Russia the produce is mainly a large, coarse, heavy, dark leaf, of use only for the manufacture of plug and snuff. In southern and Asiatic Russia good tobacco of the Turkish type is produced.

Italy produces two principal types, a dark, heavy Virginian tobacco on the heavy soils of northern Italy, and a Turkish type tobacco on the sandy soils of the southern part of the country.

Syria.—The distinctive Latakia tobacco is produced in the province of Saida in northern Syria. The leaf is subjected to the smoke produced by burning in the green condition leafy branches of species of evergreen oaks (*Quercus* spp.). The process of fumigation lasts from seven to nine months, and during it the tobacco acquires its black colour and peculiar flavour.

Greece.—Grecian tobacco is grown from Turkish seed and closely resembles Turkish tobacco in character and uses. Egyptian cigarettes are to a great extent made from Grecian tobacco. Paper is a monopoly in Greece, and Grecian cigarette manufacturers, to escape the monopoly, have transferred their business to Egypt, where they make cigarettes from Grecian tobaccos by the aid of Greek workmen.

Turkey.—Tobacco is an important crop in Turkey, where its cultivation and manufacture are monopolies. The ordinary tobacco and cigarette trade is controlled by the Regie Compagnie intéressée des tabacs de l'empire Ottoman, and Narquileh tobacco (called "tumbeki" and used in "hubble-bubbles") is in the hands of a similar organization. The small Turkish leaf is famous throughout the world. Some of the finest flavoured tobaccos are produced in the regions around Cavalla in Macedonia and ancient Ephesus in Asia Minor. The cultivation of Turkish tobaccos has been taken up in various parts of the world, *e.g.* South Africa, and to maintain the standard of the produce fresh supplies of seed were obtained annually from Turkey. To guard against this competition, the export of tobacco seed from Turkey was prohibited in 1907. The method of cultivation in Turkey is simple, and the plants are set out close together. For the best qualities the leaves are primed, air-cured, and then subjected to a lengthy treatment corresponding to mild fermentation. High prices are obtained for the best Turkish tobaccos. Thus in 1906 from Cavalla and Xanthi 11,000 tons were exported of a value of about £1,101,000, the range of the various qualities per kilo (2⅕ lb) being:—

Ghienbek.	10s. 5d. to 16s. 0d.
Kir	4s. 10d. „ 6s. 0d.
Pursuccian	2s. 11d. „ 3s. 9d.
Drama	2s. 0d. „ 2s. 10d.
Inferior brands	0s. 7d. „ 2s. 0d.

The exports go mainly to Austria-Hungary, Rumania, Italy, Egypt, the United Kingdom and the United States.

Japan.—Tobacco cultivation is a government monopoly, and in 1905 the crop amounted to about 106,572,000 lb, yielding a profit to the government of some £3,500,000. The produce is usually leaf of considerable size, of medium colour and suited only for cigarette and pipe smoking.

China.—The cultivation is widespread throughout Southern China. The picked leaves are usually either prepared for market by simple exposure to the sun for a few days, or in addition are sprinkled with groundnut oil and sometimes other materials also, which result in an increase of strength.

Sumatra.—The tobaccos of Sumatra are especially valued for outside wrappers of cigars, being very uniform, of fine texture, light brown colour, thin and elastic. They do not, however, possess the aroma essential to cigar-fillers. The industry is of quite recent growth, dating only from 1862. The famous tobacco region, about 15,000 sq. m. in area, is on the east coast of the island, almost directly on the equator, and has a very uniform and high temperature and a very high rainfall. The soil is mainly of volcanic origin. Deli is the principal district and produces the best tobaccos. The estates are usually very large, and are divided up into fields which are cultivated in rotation, each field being given several years' rest after producing one crop. The tobacco is air-cured, fires being only employed during continuous wet weather, and the process of curing occupies four or five weeks. The fermentation is very carefully controlled, and to obtain the desired light colour the temperature is kept comparatively low. The leaves are graded with the most scrupulous care and finally packed in bales of about 176 lb each. The high quality of Sumatra tobacco is due in part to the local conditions of soil and climate, and perhaps to an even greater degree to the care taken at every stage in its cultivation and preparation. The work is done by Chinese coolies under European—chiefly Dutch—supervision. The commercial success of some of the companies has been very striking, dividends as high as 111 % having been paid.

Java and Borneo tobacco is very similar to that of Sumatra.

The Philippines.—Tobacco is extensively cultivated in the plains and on the rich alluvial deposits along the sides of rivers. During recent years the average value of the product has fallen, due apparently to deterioration in quality. The exports of manufactured tobacco, such as Manila cheroots, find their principal market in China, British India, Australasia and the United Kingdom, whilst of the leaf tobacco fully three-quarters goes to Spain.

British Empire.—Tobacco is grown for local use in many parts of India, but the principal centres of its cultivation on a commercial scale are Bombay, Madras and the Punjab. American experts are frequently employed to superintend the estates and factories. In Ceylon tobacco is grown in the northern portion of the island; the produce is but little suited to the European market and is mainly exported to southern India and Cochin China.

British North Borneo competes with Sumatra as the source of the best cigar wrappers. The cultivation was begun in the island in 1883 by planters seeking new lands free from the heavy taxation to which they were subjected in Sumatra. The industry is now in the hands of three large companies, the survivors of some twenty or more which have started at various times. The greater portion of the most suitable land appears to be already under cultivation and there is little immediate prospect for much expansion of the industry. The annual value of tobacco exported is over £300,000.

In Australia tobacco is produced on a small scale in Queensland, New South Wales and Victoria. Efforts are being made to develop the industry. New Zealand has attempted to produce tobacco as a commercial crop, but the effort was abandoned several years ago.

In the West Indies tobacco is grown on a small scale in many of the British colonies, but only in Jamaica is there a definite industry. An expert, Mr F. V. Chambers, recently reported on Jamaica tobacco as of good quality and flavour but often of a heavy nature. The shade-grown tobacco was, however, hardly likely for making wrappers to be excelled by any tobacco in the world.

In the British African possessions the outlook for tobacco cultivation is in several instances favourable. Rhodesian-grown Turkish tobacco is already on the English market, as also various brands of tobacco from the Transvaal. Natal and Cape Colony have also industries of considerable local importance. Tobacco cultivation has made considerable progress in Nyasaland (British Central Africa). In 1900 there were 69 acres under this crop, the yield being 4480 lb of the value of £113. In 1907 the acreage had increased to 2330, the yield to 413,316 lb, and the value to £6889. Flue-cured bright tobacco is principally produced, but sun-cured is also exported; and in 1906–1907 experiments with Turkish tobacco gave encouraging results.

Canada produces in Ontario and Quebec coarse Virginian type tobacco.

Chemistry.

The constituents of tobacco, as of all other vegetable matter, can be grouped under three heads: water, mineral acids and bases (which pass into the ash on combustion) and organic substances. The following analyses of upper leaves made at the Connecticut state station, and recorded in Report No. 63, Office of Experiment Stations, U.S. Department of Agriculture, indicate the more important constituents and also the changes which take place during fermentation.

	Unfermented.	Fermented.
	%	%
Water	23·50	23·40
Ash	14·89	15·27
Nicótine	2·50	1·79
Nitric acid (N_2O_5) . .	1·89	1·97
Ammonia (NH_3) . . .	0·67	0·71
Other nitrogenous matters	12·19	13·31
Fibre	7·90	8·78
Starch	3·20	3·36
Nitrogen free extract .	29·39	27·99
Ether extract. . . .	3·87	3·42

Nicotine (*q.v.*) ($C_{10}H_{14}N_2$) is a volatile alkaloid which appears to be present only in plants of the genus *Nicotiana* (see NICOTINE).

Manufacture.

In the manufacture of tobacco for smoking, we have to do with the numerous forms of tobacco used for smoking in pipes, embracing cut smoking mixtures, cake or plug, and roll or spun tobacco. Under this heading come also the cigar and cigarette manufacture.

The raw material in the warehouses is of various qualities: some is strong, rough and harsh, and so is unfit for ordinary smoking; other samples are mild and fine, with aromatic and pleasant flavour, but devoid of strength. By a proper mixing and blending the manufacturer is enabled to prepare the smoking mixture which is desirable for his purpose; but certain of the rough, bitter qualities cannot be manufactured without a preliminary treatment by which their intense disagreeable taste is modified. The storing of such tobacco for a lengthened period matures and deprives it of harshness, and the same result may be artificially hastened by macerating the leaves in water acidulated with hydrochloric acid, and washing them out with pure water. The most efficient means, however, of improving strong, ill-tasting tobacco is by renewed fermentation artificially induced by moisture and heat.

Smoking Mixtures.

The manufacturer having prepared his mixture of leaves, proceeds to damp them, pure water alone being used in the United Kingdom, whereas on the Continent and in America certain "sauces" are employed, which consist of mixtures of aromatic substances, sugar, liquorice, common salt and saltpetre, &c., dissolved in water. The primary object is to render the leaves soft and pliant; the use of the sauces is to improve the flavour and burning qualities of the leaves used. When uniformly damped, the leaves are separately opened out and smoothed, the midrib, if not already removed, is torn out, except when "bird's-eye" cut is to be made, in which mixture the midrib gives the peculiar "bird's-eye" appearance. The prepared tobacco, while still moist and pliant, is pressed between cylinders into a light cake, and cut into fine uniform shreds by a machine analogous to the chaff-cutter. The cut tobacco is now roasted, partly with the view of driving off moisture and bringing the material into a condition for keeping, but also partly to improve its smoking quality. The roasting is most simply effected by spreading it on heated slabs, on which it is constantly turned, or a roasting machine is used, consisting of a revolving drum in which the tobacco is rotated, gradually passing from one end to the other, and all the time under the influence of a current of heated air. The increase in favour of packet tobaccos has brought about the invention of elaborate packing machines.

Roll Tobacco.

For roll, twist or pigtail tobacco the raw material is damped or sauced as in the case of cut tobacco. The interior of the roll consists of small and broken leaf of various kinds, called "fillers"; and this is enclosed within an external covering of large whole leaf of bright quality, such leaves being called "covers." The material is supplied to the twisting machinery by an attendant, and formed into a cord of uniform thickness, twisted and wound on a drum by mechanism analogous to that used in rope-spinning. From the drum of the twisting machine the spun tobacco is rolled into cylinders of various sizes. These are enclosed in canvas, and around the surface of each stout hempen cord is tightly and closely coiled. In this form a large number, after being cooked or stoved in moist heat for about twenty-four hours, are piled between plates in an hydraulic press, and subjected to great pressure for a month or six weeks, during which time a slow fermentation takes place, and a considerable exudation of juice results from the severe pressure. The juice is collected for use as a sheep-dip.

Cake Tobacco.

Cake or plug tobacco is made by enveloping the desired amount of fillers within covering leaves of a fine bright colour. The packages are placed in moulds, and submitted to powerful pressure in an hydraulic press, by which they are moulded into solid cakes. Both cake and roll tobacco are equally used for smoking and chewing; for the latter purpose the cake is frequently sweetened with liquorice, and sold as honey-dew or sweet cavendish.

Cigars.

For cigar-making the finest and most delicately flavoured qualities of tobacco are generally selected. A cigar consists of a core or central mass of fillers enveloped in an inner and an outer cover, the former the binder and the latter the wrapper. The fillers or inner contents of the cigar must be of uniform quality, and so packed and distributed in a longitudinal direction that the tobacco may burn uniformly and the smoke can be freely drawn from end to end. For the binder whole leaf of the same quality as the fillers is used, but for the wrapper only selected leaves of the finest quality and colour, free from all injury, are employed. The covers are carefully cut to the proper size and shape with a sharp knife, and, after being damped and smoothed out are placed together in a pile. In making cigars by the hand, the operator rolls together a sufficient quantity of material to form the filling of one cigar, and experience enables him or her to select very uniform quantities. This quantity is wrapped in the inner cover, an oblong piece of leaf the length of the cigar to be made, and of width sufficient to enclose the whole material. The cigar is then rolled in the hand to consolidate the tobacco and bring it into proper shape, after which it is wrapped in the outer cover, a shaped piece made to enclose the whole in a spiral manner, beginning at the thick end of the cigar and working down to the pointed end, where it is dexterously finished by twisting to a fine point between the fingers. The finished cigars are either spread out in the sunlight to be dried, or exposed to a gentle heat. They are then sorted into qualities according to their colour, packed in boxes, in which they are stored for sale. Machinery is now employed for forming and moulding the fillings of the cheaper grades of cigars.

Havana cigars are, as regards form, classification, method of putting up and nomenclature, the models followed by manufacturers of all classes of the goods. Genuine ("legitimas") Havana cigars are such only as are made in the island; and the cigars made in Europe and elsewhere from genuine Cuban tobacco are classed as "Havanas." Other brands of home manufacture contain some proportion of Cuban tobacco; and very good cigars may be made in which the name only of that highly-prized leaf is employed. When we come to the inferior classes of cigars, it can only be said that they may be made from any kind of leaf, the more ambitious imitations being treated with various sauces designed to give them a Havana flavour. The highest class of Cuban-made cigars, called "vegueras," are prepared from the very finest Vuelta Abajo leaf, rolled when it is just half dry, and consequently never damped with water at all. Next come the "regalias," similarly made of the best Vuelta Abajo tobacco; and it is only the lower qualities, "ordinary regalias," which are commonly found in commerce, the finer, and the "vegueras," being exceedingly high-priced. The cigars, when dry, are carefully sorted according to strength, which is estimated by their colour, and classed in a scale of increasing strength as *claro*, *colorado claro*, *maduro* and *oscuro*. They are pressed into the cigar boxes for sale, and branded with the name or trade mark of their makers. Cheroots differ from ordinary cigars only in shape, being either in the form of a truncated cone, or of uniform thickness throughout, but always having both ends open and sharply cut across. Cheroots come principally from Manila, but there are now large quantities imported into the United Kingdom from the East Indies and Burma.

Cigarettes.

Cigarettes consist of small rolls of fine cut tobacco wrapped in a covering of thin tough paper specially made for such use. Originally cigarettes were entirely prepared by the smoker himself; but now they are very largely made by automatic machinery. The machines cut the paper, gum its edge, measure out the proper quantity of tobacco, wrap it up, make the gummed edge adhere, and cut the ends. In other machines a roll of narrow paper, in width equal to the circumference of the cigarette, is converted into a long tube, filled with tobacco, and automatically cut off into proper lengths. Such machines can make several hundred cigarettes per hour. The best cigarettes, however, are made by hand; the tobacco leaves are selected and hand-cut, and the paper tubes are filled by hand.

Snuff.

The manufacture of snuff is the most complex, tedious and difficult undertaking of the tobacco manufacture, but it is now of but little importance. The tobacco best suited for snuff-making is thick fleshy leaf of a dark colour, but scraps and waste pieces resulting from the preparation of smoking mixtures and cigars, and the midribs of leaves are largely used. The material is moistened with a solution of common salt and placed in very large heaps to ferment for some weeks. Various flavouring materials, such as liquorice, tonka beans (*Dipteryx odorata*) and other ingredients are added, the natures of which are often trade secrets.

The mass is dried, ground, and allowed to ferment again, the process being repeated if necessary. The peculiar properties of snuff are dependent on the presence of free nicotine, free ammonia and the aromatic principles developed during fermentation.

Fiscal Restrictions.

In nearly all civilized countries the cultivation of tobacco and its manufacture are conducted under state supervision and form an important source of public revenue. In some, for instance, France, Austria-Hungary and Italy, the cultivation is a state monopoly, and in other countries the crop is subject to heavy excise duties. Since the time of Charles II. the growth of tobacco in Great Britain has been practically prohibited, the original enactment to that effect having been passed to encourage trade with the young colony of Virginia. In 1886 experiments were conducted, under certain restrictions, and the plant was grown in Norfolk, Kent and other counties with sufficient success to prove the entire practicability of raising tobacco as a commercial crop in England. In more recent years tobacco has been grown in Ireland, but up to 1910 it had been found impracticable to obtain from the government sufficient relaxation from fiscal restrictions to encourage the home cultivation, though in 1907 the prospect of licences being issued was held out.

Statistics.

The following table, taken from the *Year Book of the U.S. Department of Agriculture, 1906*, indicates the crops of tobacco in 1905 in the regions mentioned, so far as figures are available.

	1905.
North America	721,492,000 ℔.
South America	108,575,000 ,,
Europe	630,133,000 ,,
Asia	690,161,000 ,,
Africa	23,346,000 ,,
Australia and Fiji	1,486,000 ,,
Total	2,175,193,000 ℔.

The estimated value of the world's annual crop is approximately £40,000,000.

Consumption of Tobacco.—The comparative consumption of tobacco in various countries is best appreciated by expressing it in pounds per head, and the following figures are taken from Bartholomew's *Atlas of the World's Commerce*: Belgium 6·21 ℔, United States 5·40 ℔, Germany 3·44 ℔, Austria 3·02 ℔, Australasia 2·20 ℔, Canada 2·54 ℔, Hungary 2·42 ℔, France 2·16 ℔, United Kingdom 1·95 ℔, Russia 1·10 ℔.

The literature of tobacco is very extensive. William Bragge of Birmingham published in 1880 a revised bibliography of the subject, *Bibliotheca nicotiana*, extending to 248 quarto pages. From such a mass of authorities it would be vain here to make selections, but mention may be made of Fairholt's capital gossiping work, *Tobacco, its History and Associations* (2nd ed., 1876). As modern standard works there may also be quoted Tiedemann's *Geschichte des Tabaks* (1856) and Wagner's *Tabakcultur, Tabak- und Cigarren-Fabrication* (1884). In the foregoing account various passages from the article by J. Paton and W. Dittmar, in the 9th ed. of the *Ency. Brit.*, have been utilized. (W. G. F.)

TOBAGO, an island in the British West Indies, 20 m. N.E. of Trinidad, in 11° 15′ N. and 60° 40′ W. Pop. 18,751. It is 26 m. long and 7½ m. broad, and has an area of 114 sq. m. or 73,313 acres, of which about 10,000 are under cultivation. It consists of a single mountain mass (volcanic in origin), 18 m. in length, and rising in the centre to a height of 1800 ft. A great part of the island is clothed with dense forest, in which many valuable hardwood trees are found. The higher lands form part of what is known as the "Rain Preserve," where, in order to attract and preserve the rainfall, the trees are never allowed to be felled. The average temperature is 81° F. and the yearly rainfall is 66 in. The rainy season lasts from June to December, with a short interval in September. The valleys are particularly adapted to horse- and sheep-farming, which are growing industries. The soil is fertile and produces rubber, cotton, sugar, coffee, cocoa, tobacco and nutmegs, all of which are exported; *pimento* (allspice) grows wild in the greatest profusion. The schools are conducted by various denominations, assisted by government grants. The island is divided into seven parishes. Scarborough (pop. 769), the capital, is on the south coast, 8 m. from its south-western point. It stands at the foot of a hill 425 ft. high, on which is situated Fort King George, now without a garrison. There is a lighthouse at Baedlet Point. Tobago, properly Tobaco, was discovered in 1498 by Columbus, who named it Assumption, and the British flag was first planted in 1580. It afterwards passed into the hands of the Dutch and then of the French, and was finally ceded to the British in 1814. Until 1889 it formed part of the colony of the Windward Islands, but in that year it was joined to Trinidad, its legal and fiscal arrangements, however, being kept distinct. Ten years later it became one of the wards of Trinidad, under a warden and magistrate; its revenue, expenditure and debt were merged into those of the united colony, and Trinidadian law, with very few exceptions, was made binding in Tobago.

TOBIN, JOHN (1770–1804), English dramatist, was born at Salisbury on the 28th of January 1770, the son of a merchant. He was educated at Bristol Grammar School, and practised in London as a solicitor. From 1789 he devoted all his spare time to writing for the stage. He submitted no fewer than thirteen plays before, in 1803, he got an unimportant farce staged. In 1804, having just submitted his fourteenth play, a romantic blank verse drama entitled *The Honey Moon*, to the Drury Lane management, he came to the conclusion that it was useless to continue playwriting and left London to recruit his health. The news that his play had been accepted came too late. He had long had a tendency to consumption, and was ordered to winter in the West Indies. He left England on the 7th of December 1804, but died on the first day of the voyage. In the following year *The Honey Moon* was produced at Drury Lane, and proved a great success. Several of Tobin's earlier plays were subsequently produced, of which *The School for Authors*, a comedy, was probably the best.

See also *The Memoirs of John Tobin*, with a selection from his unpublished writings, by Miss Benger (London, 1820).

TOBIT, THE BOOK OF, one of the books of the Old Testament Apocrypha. It is a good specimen of the religious novel, a form of literature invented by the Jews. The romance may be read in a beautiful dress in the Revised Version of the English Apocrypha. It was never admitted into the Jewish canon, but it was admitted into the Christian Canon at the Council of Carthage (A.D. 397). In the Roman Church it still forms a part of the Bible, but by the Church of England it is relegated to the position of those other books which "the Church doth read for example of life and instruction of manners, but yet doth it not apply them to establish any doctrine" (art. vi.). Some verses (Tob. iv. 7–9), however, are read in the offertory; and Tobias and Sarah once occupied the position now held by Abraham and Sarah in the marriage service.

The Book of Tobit has reached us in Greek, Latin, Syriac, Aramaic and Hebrew versions; of these the Hebrew are the latest, and need not be considered. Of the Greek there are three forms. One is in the Vatican and Alexandrian MSS.; another is in the Sinaitic. Both these texts are to be found in Swete's Septuagint, the former denoted by B, and the latter by ℵ. B is the common text, which is followed in the English Apocrypha. Nevertheless ℵ is fuller, except in ch. iv., and more intelligible; it is also more Semitic than B. The two must have behind them a common original, for they throw light upon one another, and the full meaning of a passage is sometimes only to be got from a combination of both. The fullness of ℵ often runs into superfluities, which are retrenched in B. The third Greek text is only a partial one (vi. 9–xiii. 8). It may be derived from a study of Codices 44, 106, 107 in Holmes and Parsons, which diverge from the Vatican text throughout the part indicated. Of the Latin there are two chief forms, the old translation, sometimes called the *Itala*, and that of Jerome in the Vulgate. The *Itala* was published by Pierre Sabatier at Paris in 1751, and is reproduced in the Book of Tobit by Neubauer (Clarendon Press, 1878). It agrees very fairly with ℵ, except in the matter of proper names. Jerome's version is from the Aramaic, or, as it used to be called, the Chaldee. It cost the saint one day's work. He describes in his preface the method of its production. He procured the services of a man who was familiar with Chaldee and Hebrew. This man translated to him out of Chaldee into Hebrew, while Jerome dictated to a shorthand writer his own translation into Latin. The work was done at the request of two Christian bishops, Chromatius and Heliodorus. Jerome does not mention the *Itala*, but it is plain that he was indebted to it. The Syriac text is said to be based on a Greek version. It was only in 1878 that the Aramaic version was brought to light, being published by Adolph Neubauer from a unique MS. in the Bodleian Library. It agrees with ℵ and the *Itala*, but resembles the Vulgate in having nothing in the first person. According to Neubauer, it is the very text which was used by Jerome, after allowance has been made for the arbitrary methods of the Rabbis and of Jerome himself. But the Aramaic version has Greek birthmarks (see especially p. 7, line 18), which other scholars than its editor have thought decisive against its originality. It was held by Robertson Smith (after Nöldeke) to be "in the highest degree probable that the Greek text is original." But the Greek text appears to be itself a translation from some Semitic source. Was this source Hebrew or Aramaic? The forms Ἀθήρ and Ἀθουρείας in xiv. 4, 15 of ℵ show that, at least, that chapter is drawn from Aramaic, not from Hebrew. But that chapter does not appear in all the versions, and so may be later than the rest.

With regard to the date of composition there is the widest difference of opinion. Ewald refers it to the end of the Persian period, about 350 B.C. (an opinion which Westcott declared to be "almost certainly correct"); Kohut thinks that the book was composed in Persia under the Sassanid Dynasty, about A.D. 250. But Tobit is already quoted as "scripture" by Clement of Alexandria (*Strom.* ii. 139, p. 503 Pott). The words of Tobit (xii. 8, 9) seem almost to have been present to the writer of ii. Clement (xvi. 4). The date of this document is uncertain; but in Irenaeus (i. 28, § 5) in his refutation of the Kabbalistic heresy of the Ophites, we find Tobias figuring as a prophet, on the same level as Haggai. Earlier still the Book of Tobit is quoted, though not by name, in the Epistle of Polycarp to the Philippians (x. 2; Tob. iv. 10. Cf. Prov. xii. 2; Ecclus. xxix. 12). Now the martyrdom of Polycarp is assigned by C. H. Turner to the year A.D. 156. We seem to have even a quotation by St Paul from the Book of Tobit (1 Tim. vi. 19; Tob. iv. 9), in which the identity amid difference seems to show that the Apostle is drawing, not from the Greek, but from the Semitic original. Josephus displays no knowledge of the work, but he may have been animated by the same prejudice as the Pharisees of St Jerome's day, whose displeasure, that father tells us, he had to face in giving to Latin readers a book which was against their canon. (Preface to Tobit.) Internal evidence shows that the writer of the 14th chapter lived after the building of the Second Temple, which was "not as the first." In *vv.* 5 and 6 of that chapter Tobit is made to predict a glorious building of Jerusalem and the Temple, which was to be followed by the conversion of all the Gentiles. Such a passage might well have been penned when the idea of Herod's Temple was already in the air. If so, this chapter may be supposed to have been written a little before 19 B.C., while the bulk of the work may have been indefinitely earlier.

As to the place of composition Persia, Egypt and Palestine have each had advocates. One thing only appears fairly certain, namely, that the Greek versions were composed in Egypt. This conclusion could, we think, be established by an examination of the language, especially of some technical terms of administration. But the tale itself carries us back to Persia. It has what Moulton called an "Iranian background." The evil demon Asmodeus (*q.v.*) is the Persian Aēshma Daēva. Raphael, "one of the seven holy angels, which present the prayers of the saints, and go in before the glory of the Holy One," resembles the protecting spirit Sraosha. And the dog, the companion of Sraosha, is there too. For Tobit differs from all other books of the Bible in containing the only polite reference to the dog. Tobias's dog indeed does nothing but accompany his young master on his journey to Ecbatana and back. But he is there as the companion and friend of man, which is Aryan and not Semitic. So alien indeed is this from the Semitic mind that in the Aramaic and Hebrew versions the dog does not appear.

Even in א, the more Semitic of the two Greek versions, the dog has evidently been found an offence. Mention of him is suppressed in v. 17, while in xi. 4, ὁ Κύριος is made to go behind Tobias, instead of ὁ κύων!

The motive of the story has been variously regarded as a desire to insist upon the duty of tithe-paying, upon that of almsgiving, and upon that of burying the dead. The Midrash given by Neubauer has no doubts on this point, as the story is immediately followed by the remark—"Behold we learn how great is the power of alms and tithes!" But the third motive is equally apparent. Accordingly some have insisted that the story must have been composed at some period when Jewish dead were left unburied, either in the time of Antiochus Epiphanes (2 Macc. v. 10), or in that of Hadrian, after the revolt of Bar-Cochebas. If our choice were limited to these two periods, we should certainly prefer the former. For the book carries within itself signs of early date. It contains no Messianic expectation nor any reference to a future life. The last fact is obscured by the Vulgate. Even in the *Itala* the word *aeterna* is added in xii. 9 after *saturabuntur vita*.

A new interest has been added recently to the study of Tobit by the publication of the *Wisdom of Aḥikar* (*Aḥiqar*). In the Book of Tobit Aḥikar is represented as the prime minister of Sennacherib and his son Esar-Haddon, and is claimed by Tobit as his nephew. There is a desire manifested to bring in Aḥikar wherever possible (i. 21, 22; ii. 10; xi. 18; xiv. 10). The intention evidently is to bestow authority upon the fiction by connecting it with a story already known.

(St G. S.)

TOBOGGANING (Micmac Indian, *tobaakan*, sledge), the sport of sliding down snow-covered hills and artificial ice-shutes on the toboggan, a sled from 3 ft. to 8 ft. long and 2 ft. to 3 ft. wide, formed of strips of wood from ¼ in. to ½ in. in width, fitted together and curved up at the front. The toboggan is not so well fitted for use on roads that are not steep or very smooth as is the sled provided with runners, but is generally used on open hills, or upon artificial courses (chutes), which are very popular in Canada. For "Tobogganing," as known in the Engadine winter resorts, see Coasting.

TOBOLSK, a government of western Siberia, having the Arctic Ocean on the N., the governments of Archangel, Vologda, Perm and Orenburg on the W., the provinces of Akmolinsk and Semipalatinsk on the S., and the governments of Tomsk and Yeniseisk on the E. It is one of the largest provinces of the Russian Empire, occupying 530,820 sq. m. The northern coast is formed by the Yalmal or Yanmal peninsula, separating the Bay of Kara (on the west) from the double bays of the Ob and Taz (on the east). The Pai-ho coast-ridge touches Tobolsk only at its south-eastern extremity. The Urals proper, which run south-west from the Kara Sea as far as the Töll-pos (5445 ft.), and thence take a southerly direction, form the boundary between Tobolsk and Vologda as far as 62° N., but further south their eastern slopes are included in the government of Perm, and only their lowest spurs, 200 m. from the main chain, belong to Tobolsk.

The remainder of the government is lowland, but varies greatly in its different parts. In the south it assumes the character of grassy steppes or prairies, in the north of immense marshes sparsely overgrown with forest, and of treeless tundras as the shores of the Arctic Ocean are approached. The south steppes, in their turn, may be subdivided into two distinct portions, the Tobol and Ishim steppe in the west and the Baraba in the east. The former, nearly 43,000 sq. m. in area, is one of the most fertile parts of the empire. One-third is under forest, and the remainder has a soil of very productive black earth, which enjoys the further advantage of being sufficiently drained. The climate is very severe, the mean annual temperature (30° to 34° F.) being that of the north of Sweden and of Archangel; but the warm summer (65° to 68° in July) and the amount of light received from a bright sky combine to make vegetation develop with a rapidity unknown to west Europe. The Baraba steppe extends to about 55,000 sq. m. and is covered with recent deposits; but, as there is no definite slope, the surface waters accumulate in a large number of lakes and marshes. The climate is moister and the summer shorter and less hot than in the Tobol and Ishim steppe. Forests, consisting chiefly of birch, occur sporadically over its surface. The soil of this region also is very productive, but the fertile patches are separated by marshy ground, and the dense clouds of mosquitoes in summer are a plague to both man and beast. To the north of the regions just indicated lie the administrative districts of Tura, Tobolsk and Tara, with an area of about 110,000 sq. m.; this may be described as the *taiga* region. It consists throughout of impenetrable forests and quaking quagmires—the dreadful *urmans*, which are altogether impenetrable 50 m. from the scattered settlements. Gigantic cedar-trees, larches, firs, pines, birches and maples grow very close together, and the underwood is so dense that a passage can be forced only with the hatchet, the difficulties being further increased by the abundance of decayed wood and by the marshy foothold. To cross these *urmans*, which are treacherously concealed under a swaying carpet of grassy vegetation, a kind of snow-shoe has to be used even in summer, and many can be crossed only in winter. Indeed vast areas have never been visited by man. The south-western parts of this region are traversed by the Siberian highway, and to this circumstance alone is it indebted for its population of nearly half a million.

The government is drained by the Ob, which traverses it for more than 1300 m., and is navigable throughout. It receives many tributaries, some of which are 200 to 350 m. long, but flow through quite uninhabited regions. The Irtysh, a left-hand tributary, spreads a network of affluents all over the south of the government and is navigable for the whole of its length of 760 m.; it receives the Tobol, about 420 m. long, also navigable, the Ishim, and a number of less important streams; while the Tura, a tributary of the Tobol, is also navigable. Navigation lasts for nearly six months in the south. The first steamer on the Ob system was launched in 1845 and the second in 1860; since the latter date steam navigation has steadily developed.

The estimated population in 1906 was 1,656,700, and is practically all Russian, except for some 42,000 Tatars in the south, 18,000 Ostyaks, 4500 Samoyedes, and 4800 Voguls. There are, moreover, about 5000 Germans and Finns, some Jews in the towns, and about 1500 gipsies. The government is divided into ten districts, the chief towns of which are Tobolsk, Berezov, Ishim, Kurgan, Sugut, Tara, Turinsk, Tyukalinsk, Tyumen and Yalutorovsk. The standard of education is very low. The Ostyaks are in a very miserable condition, having come under heavy obligations to the Russian merchants and being compelled to hand over to them nearly all the produce of their hunting and fishing. The Tatar settlements are prosperous in the south, but not in the Tobolsk district, where their lands have been appropriated for the Russian settlers. Many of the Samoyedes, Ostyaks and Voguls are nominally Christians. The Russians and the Tatars live mostly by agriculture. Of the total area of land regarded as suitable for cultivation (28,400,000 acres), 15,600,000 or 55 % are owned by the peasant communities.

Agriculture is generally the chief occupation, and Tobolsk is fast becoming a granary from which corn is exported to the northern governments of European Russia. The total area under cereal crops in 1900 was 3,334,600 acres, and the principal crops are rye, wheat, oats, barley and potatoes. Flax, hemp and tobacco are cultivated in the south. Livestock breeding is carried on on a large scale. Dairy-farming has made remarkable progress since the trans-Siberian railway was built.

The industries are insignificant (chiefly tanning, distilling and tallow-melting); ironworks and cloth mills are still in their infancy. The export of cattle, hides, tallow, corn, flour, fish and furs to Russia, both from Tobolsk and from the Kirghiz steppe, is of some importance. Spirits are sent farther east to Tomsk; while all kinds of manufactured wares are imported from Russia. The fairs of Irbit and Ishim are the chief centres for trade. (P. A. K.; J. T. Be.)

TOBOLSK, a town of Asiatic Russia, capital of the government of the same name, on the right bank of the Irtysh, near its confluence with the Tobol. Pop. (1900), 21,401. It is 305 m. E.N.E. from Ekaterinburg, and is no longer the capital of West

Siberia nor even an administrative centre for exiles. The kreml, or citadel, built in the reign of Peter the Great, by Swedish prisoners, in imitation of the kreml of Moscow, contains the cathedral, erected towards the end of the 17th century. Some 12 m. south-east are the ruins of the "fort of Kuchum," the site of the capital of Siberia, Isker, before the Russian conquest. Tobolsk was founded in 1587 by Cossacks, and forms the see of the bishop of Tobolsk and Siberia.

TOBRUK (anc. *Antipyrgos*), a settlement with small Turkish garrison on a fine natural harbour situated on the N. coast of Africa at the intersection of 32° N. Lat., with 24° E. Long. The harbour, which is small but deep, and sheltered by high ground, opens to the east. It is about 2½ m. long by ¾ m. wide; the depth in the centre is over 40 ft. and soundings of over 30 ft. extend to within a very short distance of the shores. It is the only safe port easily accessible to large vessels for over 1000 m., between Sfax in Tunisia and Alexandria, for, although there is safe and deep anchorage in the recess of the Gulf of Bomba, the entrance is rocky and difficult. Tobruk has long been the outlet for the trade of the oases which extend from Jarabub to Siwah, and are a stronghold of the Senussi order (see CYRENAICA); and it is also the headquarters of the Libyan sponge fishery, prosecuted by Greeks. In the spring it is visited by a great number of boats, to protect which a small Hellenic warship has sometimes been despatched. But it is as a future man-of-war harbour that Tobruk is likely to be important. It has been visited both by British and Italian squadrons and has become an object of considerable solicitude to the government of Italy. By running into Tobruk and the neighbouring Gulf of Bomba the French fleet eluded British vigilance on its way to Egypt in 1798. (D. G. H.)

TOCHI VALLEY, or DAWAR, one of the chief routes into Afghanistan in the North-West Frontier Province of India. It leads from the Bannu through tribal country, and is inhabited by the Dawari (*q.v.*). The valley is divided into two parts, known as Upper and Lower Dawar, by a narrow pass called the Taghrai Tangi, some three m. long. Between Dawar and British territory is the low range of uninhabited hills, which skirt the Bannu district. It was by this route that Mahmud of Ghazni effected several of his raids into India and the remains of a road flanking the valley and of defensive positions are still to be traced. After the Waziristan Expedition of 1894 the Tochi was garrisoned by British troops; but when Lord Curzon reorganized the frontier in 1901, the British troops were withdrawn, and their place supplied by tribal militia. The chief posts are Saidgi, Idak, Miranshah, Datta Khel and Sheranni. The valley was the scene of action for the Tochi or Dawari Expedition under Brigadier-General Keyes in 1872, and the Tochi Expedition under General Corrie Bird in 1897.

TOCQUEVILLE, ALEXIS HENRI CHARLES MAURICE CLEREL, COMTE DE (1805–1859), was born at Verneuil on the 29th of July 1805. His family on the father's side were of good descent, and distinguished both in the law and in arms, while his mother was the granddaughter of Malesherbes. Alexis de Tocqueville was brought up for the bar, or rather for the bench, and became an assistant magistrate in 1830. A year later he obtained from the government of July a mission to examine prisons and penitentiaries in America, and proceeded thither with his life-long friend Gustave de Beaumont. He returned in less than two years, and published a report, but the real result of his tour was the famous *De la Démocratie en Amérique*, which appeared in 1835, and very soon made his reputation (3rd ed. 1868). It was at once caught up by influential members of the Liberal party in England, which country Tocqueville soon after visited, and where he married an Englishwoman. Returning to France, he was elected a member of the *Académie des sciences morales et politiques* (Jan. 6, 1838), and beginning life as a country gentleman at Tocqueville, he thought to carry out the English ideal completely by standing for the chamber of deputies. But, with a scruple which illustrated his character, he refused government nomination from Molé, and was defeated. Later he was successful, and sat for several years both before and after the revolution of February, becoming in 1849 vice-president of the assembly, and for a few months minister of foreign affairs. He was a warm supporter of the Roman expedition, but an equally warm opponent of Louis Napoleon, and after being one of the deputies who were arrested at the *coup d'état* he retired from public life. Twenty years after his first, he produced another book, *De l'Ancien régime*, which almost, if not quite, equalled its success. His health was never very strong, and in 1858 he broke a blood-vessel. He was ordered to the south, and, taking up his residence at Cannes, died there on the 16th of April 1859. He had published some minor pieces during his lifetime, and his complete works, including much unpublished correspondence, were produced after his death in uniform shape by H. G. de Beaumont (*Œuvres complètes de Tocqueville*, 9 vols., 1860–1865).

During the last twenty years of his life, and for perhaps half that time after his death, Tocqueville had an increasing European fame. His manner, which is partly imitated from Montesquieu, has considerable charm; and he was the first and has remained the chief writer to put the orthodox liberal ideas which governed European politics during the first half or two-thirds of the 19th century into an orderly and attractive shape. He was, moreover, as has been said, much taken up by influential persons in England—N. W. Senior, John Stuart Mill and others—and he had the great advantage of writing absolutely the first book of reasoned politics on democratic government in America. Besides, he was, if not an entirely impartial writer, neither a devotee nor an opponent of democracy. All this gave him a very great advantage which he has not yet wholly lost. At the same time he had defects which were certain to make themselves felt as time went on, even without the alteration of the centre of liberal opinion which has taken place of late years. The chief of these was a certain weakness which can hardly be described by any word more dignified than "priggishness." His correspondence with Molé, above alluded to, is an instance of this, and it was also reflected on in various epigrams by countrymen and contemporaries; one of these accuses him of having "begun to think before he had begun to learn," while another declares that he *avait l'air de savoir de toute éternité ce qu'il venait d'apprendre*. He appears both in reading history and in conducting actual political business to have been constantly surprised and disgusted that men and nations did not behave as he expected them to behave. This excess of the deductive spirit explains at once both the merits and the defects of his two great works, which will probably remain political classics, though they are less and less likely to be used as practical guides.

See Heinrich Jacques, *Alexis de Tocqueville; ein Lebens- und Geistesbild* (Vienna, 1876); James Bryce, *The Predictions of Tocqueville* (Baltimore, 1887); Count de Puymaigre, *Les Souvenirs d'Alexis de Tocqueville* (1893); and *Correspondance entre Alexis de Tocqueville et Arthur de Gobineau* (1908).

TOCSIN, a signal of alarm given by the ringing of a bell, hence any warning or danger signal. The earliest form in English is *tocksaine*, which was borrowed from the O. Fr. *toquesin* (*toquer*, to strike, cf. *toucher* and *sin*, mod. *signe*, a signal, Lat. *signum*). The use of "touch" and its cognate forms with the idea of giving a sound is seen in "tucket," Ital. *toccata*, which probably originally meant a signal given by tap of drum, but is always applied to a flourish or fanfare on a trumpet.

TOD, JAMES (1782–1835), British officer and Oriental scholar, was born on the 20th of March 1782, and went to India as a cadet in the Bengal army in 1799. He commanded the escort attached to the resident with Sindia from 1812 to 1817. In the latter year he was in charge of the Intelligence Department which largely contributed to break up the confederacy of Maratha chiefs in the Pindari War, and was of great assistance in the campaign in Rajputana. In 1818 he was appointed political agent for the states of western Rajputana, where he conciliated the chieftains, settled their mutual feuds and collected materials for his *Annals and Antiquities of Rajasthan* (2 vols., 1829–1832). Another book of value, *Travels in Western India* (1839), was published posthumously. He returned from India in 1823, was promoted lieutenant-colonel in 1826, and died in London on the 17th of November 1835.

TODAS, a small pastoral tribe of Southern India, found only on the Nilgiri hills. They are distinguished by their tall, well-proportioned figures, aquiline noses, long, black, wavy hair and full beards. Their colour is a light brown. Their dress consists of a single cloth, which they wear like the plaid of a Scotch highlander. The women cover the whole body with this mantle. Their sole occupation is cattle-herding and dairy-work. They practise polyandry, a woman marrying all the brothers of a family. The proportion of females to males is about three to five. Their language is a mixture of Tamil and Kanarese, and is classified by Bishop Caldwell as a separate language of the Dravidian family. The Todas worship their dairy-buffaloes, but they have a whole pantheon of other gods. The only purely religious ceremony they have is Kona Shastra, the annual sacrifice of a male buffalo calf. Toda villages, called *mands*, usually consist of five buildings or huts, three of which are used as dwellings, one as a dairy and the other for sheltering the calves at night. These huts are of an oval, pent-shaped construction usually 10 ft. high, 18 ft. long and 9 ft. broad. They are built of bamboo fastened with rattan and thatched. Each hut is enclosed within a wall of loose stones. The inhabitants of a *mand* are generally related and consider themselves one family. The Todas numbered 807 in 1901.

See W. H. R. Rivers, *The Todas* (1906).

TODHUNTER, ISAAC (1820–1884), English mathematician, son of George Todhunter, a Nonconformist minister, was born at Rye on the 23rd of November 1820. He was educated at Hastings, at which town his mother had opened a school after the death of his father in 1826. He became an assistant master at a school at Peckham, attending at the same time evening classes at the University College, London. In 1842 he obtained a mathematical scholarship and graduated as B.A. at London University, and was awarded the gold medal on the M.A. examination. About this time he became mathematical master at a school at Wimbledon. In 1844 he entered St John's College, Cambridge, where he was senior wrangler in 1848, and gained the first Smith's prize and the Burney prize; and in 1849 he was elected to a fellowship, and began his life of college lecturer and private tutor. In 1862 he was made a fellow of the Royal Society, and in 1865 a member of the Mathematical Society of London. In 1871 he gained the Adams prize and was elected to the council of the Royal Society. He was elected honorary fellow of St John's in 1874, having resigned his fellowship on his marriage in 1864. In 1880 his eyesight began to fail, and shortly afterwards he was attacked with paralysis. He died at Cambridge on the 1st of March 1884.

Works.—*Treatise on the Differential Calculus and the Elements of the Integral Calculus* (1852, 6th ed., 1873), *Treatise on Analytical Statics* (1853, 4th ed., 1874); *Treatise on the Integral Calculus* (1857, 4th ed., 1874); *Treatise on Algebra* (1858, 6th ed., 1871); *Treatise on Plane Coordinate Geometry* (1858, 3rd ed., 1861); *Plane Trigonometry* (1859, 4th ed., 1869); *Spherical Trigonometry* (1859); *History of the Calculus of Variations* (1861); *Theory of Equations* (1861, 2nd ed. 1875); *Examples of Analytical Geometry of Three Dimensions* (1858, 3rd ed., 1873); *Mechanics* (1867), *History of the Mathematical Theory of Probability from the Time of Pascal to that of Lagrange* (1865); *Researches in the Calculus of Variations* (1871); *History of the Mathematical Theories of Attraction and Figure of the Earth from Newton to Laplace* (1873); *Elementary Treatise on Laplace's, Lamé's and Bessel's Functions* (1875); *Natural Philosophy for Beginners* (1877). An unfinished work, *The History of the Theory of Elasticity*, was edited and published posthumously in 1886 by Karl Pearson. Todhunter also published keys to the problems in his textbooks on algebra and trigonometry; and a biographical work, *William Whewell, account of his writings and correspondence* (1876), in addition to many original papers in scientific journals.

See obituary notices in the *Proc. Lond. Math. Soc.* (1884), and *Proc. Roy. Soc.* (1884).

TODI (anc. *Tuder*), a town and episcopal see of the province of Perugia, Italy, 28 m. S. of Perugia by road, on a steep hill above the east bank of the Tiber, 1348 ft. above sea-level, and 866 ft. above the river. Pop. (1901), 3599 (town), 16,528 (commune). Some portions of the ancient town walls—of two enceintes, an inner and an outer, the former attributed to the original Umbrian inhabitants, the latter to the Romans—are preserved, and also remains of baths, amphitheatre, theatre, and a substruction wall of massive masonry, with four niches. Here was found the bronze statue of Mars, now in the Vatican, so that the building is sometimes erroneously called the temple of Mars. Beneath the cathedral square, at the highest point of the town, is a large reservoir. The Romanesque cathedral has a simple façade (partly of the 11th, partly of the 14th and 15th centuries), with a fine portal and rose window. In the same square is the massive Romanesque Gothic Palazzo Comunale of 1267, the Palazzo dei Priori and the Palazzo della Podesta. The Gothic church of S. Fortunato, with its nave and aisles of the same height, has a splendid portal; the upper part of the façade is unfinished. Both this church and the cathedral have good choir-stalls.

Just outside the town on the west is the pilgrimage church of S. Maria della Consolazione, one of the finest buildings of the Renaissance, and often wrongly attributed to Bramante. Contemporary documents prove that the interior was begun in 1508 by Cola Matteuccio da Caprarola, and the exterior completed in 1516–1524 by Ambrogio da Milano and Francesco di Vito Lombardo; the slender dome was not added till 1606; its plan is a Greek cross. S. Fillippo in the town, a church of the early 16th century, betrays the influence of the Consolazione in details.

During the period of its independence, the town struck coins with the legend *Tutere*. It is hardly mentioned in history until it received Roman citizenship in the Social War. Crassus took it in 83 B.C.; and a colony was founded there by Octavian, including some soldiers of the 41st legion, which only existed in his time, after which it bore the name *Colonia Iulia fida Tuder*. It was a station on the road between America and Perusia, but otherwise is hardly mentioned. Narses won a victory over the Goths near Todi in 552, and Totila lost his life. In the middle ages it had frequent struggles with Perugia, and its obedience to the church until the 16th century was somewhat fitful. The village of Vicus Martis Tudertium lay 9 m. to the east on the Via Flaminia. Several inscriptions mention it (*Corpus inscript. lat.* xi. 694).

TODLEBEN (or Totleben), **FRANZ EDUARD IVANOVICH,** Count (1818–1884), Russian engineer general, was born at Mittau in Courland, on the 20th of May 1818. His parents were of German descent, and of the mercantile class, and he himself was intended for commerce, but a strong instinct led him to seek the career of a military engineer. He entered the school of engineers at St Petersburg, and passed into the army in 1836. In 1848 and the two following years he was employed, as captain of engineers, in the campaigns against Schamyl in the Caucasus. On the outbreak of war between Russia and Turkey in 1853, he served in the siege of Silistria, and after the siege was raised was transferred to the Crimea (see Crimean War). Sevastopol, while strongly fortified toward the sea, was almost unprotected on the land side. Todleben, though still a junior field officer, became the animating genius of the defence. By his advice the fleet was sunk, in order to blockade the mouth of the harbour, and the deficiency of fortifications on the land side was made good before the allies could take advantage of it. The construction of earthworks and redoubts was carried on with extreme rapidity, and to these was transferred, in great part, the artillery that had belonged to the fleet. It was in the ceaseless improvisation of defensive works and offensive counterworks to meet every changing phase of the enemy's attack that Todleben's peculiar power and originality showed itself. He never commanded a large army in the open field, nor was he the creator of a great permanent system of defence like Vauban. But he may justly be called the originator of the idea that a fortress is to be considered, not as a walled town but as an entrenched position, intimately connected with the offensive and defensive capacities of an army and as susceptible of alteration as the formation of troops in battle or manœuvre. Until the 20th of June 1855 he conducted the operations of defence at Sevastopol in person; he was then wounded in the foot, and at the operations which immediately preceded the fall of the fortress he was not present. In the course of the siege he had risen from the rank of lieutenant-colonel to that of lieutenant-general, and had also been made aide-de-camp to the tsar. When he recovered he was employed in strengthening the fortifications at the mouth of the Dnieper, and also those of Cronstadt. In 1856 he visited England, where his merits were well understood. In 1860 he was appointed assistant to the grand-duke Nicholas, and he became subsequently chief of the department of engineers with the full rank of general. He was given no command when war with Turkey began in 1877. It was not until after the early reverses before Plevna (*q.v.*) that the soldier of Sevastopol was called to the front. Todleben saw that it would be necessary to draw works round Osman Pasha, and cut him off from communication with the other Turkish commanders. In due time Plevna fell. Todleben then undertook the siege of the Bulgarian fortresses. After the conclusion of preliminaries of peace, he was placed in command of the whole Russian army. When the war was over he became governor of Odessa and hereditary count. But his health was broken, though for some time after 1880 he held the post of governor of Vilna, and after much suffering he died at Bad Soden near Frankfort-on-Main, on the 1st of July 1884.

His great work on the defence of Sevastopol appeared in Russian, French and German (5 vols. 1864–1872). Besides this, he wrote a letter to General Brialmont on the operations around Plevna; this was printed in the Russian engineer journal, and in German in the *Archiv für preussische Artillerie-offiziere* (1878).

See Brialmont, *Le Général comte Todleben* (Brussels, 1884); Rieger, "Todleben u. seines Wirkens Bedeutung für die Kriegskunst der Zukunft" (in *Mittheilungen über Gegenstände des Artillerie- und Geniewesens*, Vienna, 1885); Witzleben, in *Internationale Revue über die gesammten Armeen und Flotten* (1879); Schröder, in *Archiv für Artillerie- und Ingenieur-Offiziere* (Berlin, 1888); *Life* by Schilder (in Russian, St Petersburg, 1885–1887); Krahmer, *General-Adjutant Graf Todleben* (Berlin, 1888).

TODMORDEN, a market town and municipal borough in the Sowerby parliamentary division of the West Riding of Yorkshire, England, extending into the Middleton parliamentary division of Lancashire; 19 m. N.N.E. of Manchester, on the Lancashire & Yorkshire railway. Pop. (1901), 25,418. It lies on both sides of the river Calder, and the scenery of the valley is beautiful in spite of the numerous factories. Todmorden Hall, a picturesque old mansion of various dates, was the seat of the Radcliffes, but they sold the manorial rights about the close of the 17th century. The town hall is a handsome classical building erected in 1875; it bridges the county boundary, the Calder, enabling the magistrates to exercise jurisdiction in both counties. There is a bronze statue to John Fielden (1784–1849), to whose energy in developing the cotton manufacture the town owes much of its prosperity. The staple industry is the spinning and weaving of cotton, and there are also foundries and machine-works. The municipal borough, incorporated in 1896, is under a mayor, 6 aldermen and 18 councillors. Area, 12,773 acres.

TODY, T. Pennant's rendering (*Gen. Birds*, pp. 15, 61) through the French *Todier* of M. J. Brisson (*Ornithologie*, iv. 528) of the somewhat obscure Latin word *Todus*,[1] not unhappily applied in 1756 by Patrick Browne (*Civ. and Nat. Hist. Jamaica*, p. 476) to a little bird remarkable for its slender legs and small feet, the "green sparrow" or "green humming-bird" of Sir H. Sloane (*Voyage*, ii. 306). The name, having been taken up by Brisson (*loc. cit.*) in 1760, was adopted by Linnaeus, and has since been recognized by ornithologists as that of a valid genus, though many species have been referred to it which are now known to have no affinity to the type, the *Todus viridis* of Jamaica, and accordingly have since been removed from it. The genus *Todus* was at one time placed among the *Muscicapidae* (cf. FLYCATCHER); but J. Murie's investigations (*Proc. Zool. Society*, 1872, pp. 664–680, pl. lv.) have conclusively proved that it is not passerine, and is nearly allied to the *Momotidae* (cf. MOTMOT) and *Alcedinidae* (cf. KINGFISHER), it being regarded as forming a distinct sub-family *Todinae* of the Momotidae peculiar to the Greater Antilles, each of which islands has its own species, all of small size, the largest not exceeding four inches and a half in length.

Of the species already named, *T. viridis*, P. H. Gosse (*B. Jamaica*, pp. 72–80) gives an interesting account. "Always conspicuous from its bright grass-green coat and crimson-velvet gorget, it is

(After Gosse.)

Tody (*Todus viridis*).

still a very tame bird; yet this seems rather the tameness of indifference than of confidence; it will allow a person to approach very near, and, if disturbed, alight on another twig a few yards distant . . . commonly it is seen sitting patiently on a twig, with the head drawn in, the beak pointing upwards, the loose plumage puffed out, when it appears much larger than it is. It certainly has an air of stupidity when thus seen. But this abstraction is more apparent than real; if we watch it, we shall see that the odd-looking grey eyes are glancing hither and thither, and that ever and anon the bird sallies out upon a short feeble flight, snaps at something in the air, and returns to his twig to swallow it." The birds of the family also show their affinity to the kingfishers, motmots and bee-eaters by burrowing holes in the ground in which to make their nest, and therein laying eggs with a white translucent shell. The sexes differ little in plumage.

All the four species of *Todus*, as now restricted, present a general similarity of appearance, and possess very similar habits; and even these, by some ornithologists, might be regarded as geographical races. The Cuban form is *T. multicolor*; that of Haiti is *T. subulatus* or *dominicensis*; and that of Porto Rico, originally named in error *T. mexicanus*, has since been called *hypochondriacus*.

(A. N.)

TOGGENBURG, THE, a special name given to the upper valley of the river Thur, in the Swiss Canton of St Gall. It descends in a N.W. direction from the watershed between the Rhine and the Thur, and is enclosed N.E. by the chain of the Säntis (8216 ft.) and S.W. by that of the Kurfürsten (7576 ft.) and of the Speer (6411 ft.). It is a fertile valley of about 30 m. in length from the source of the river to Wil on the railway line between Winterthur and St Gall. The upper half is traversed by an excellent carriage road, while from Kappel there is a railway to Wil (15½ m.). Its industrious population numbered 34,594 in 1900, nearly equally divided between Romanists and Protestants, mostly German-speaking. Those of the upper half are devoted to pastoral pursuits while those of the lower half are engaged in the manufacture of muslin and cotton. This valley is as yet frequented only by Swiss visitors, and retains many characteristics of sub-alpine Switzerland before the arrival

[1] In Forcellini's *Lexicon* (ed. De Vit, 1875) we find "Todus genus parvissimae avis tibias habens perexiguas." Ducange in his *Glossarium* quotes from Festus, an ancient grammarian, "Toda est avis quae non habet ossa in tibiis; quare semper est in motu, unde Todiu (al. Todinus) dicitur ille qui velociter todet et movetur ad modum todae, et todere, moveri et tremere ad modum todae." The evidence that such a substantive as *Todus* or *Toda* existed seems to rest on the adjectival derivative found in a fragment of a lost play (*Syrus*) by Plautus, cited by this same Festus. It stands "cum extritis [*extortis*] talis, cum todillis [*todinis*] crusculis"; but the passage is held by scholars to be corrupt. Among naturalists Gesner in 1555 gave currency (*Hist. animalium*, iii. 719) to the word as a substantive, and it is found in Levins's *Manipulus vocabulorum* of 1570 (ed. Wheatley, 1867, col. 225) as the equivalent of the English "titmouse." Ducange allows the existence of the adjective *todinus*. Stephanus suggests that *todi* comes from *τυτθοί*, but his view is not accepted. The verb *todere* may perhaps be Englished to "toddle"!

of the horde of tourists. At Wildhaus, the highest village (3632 ft.), the house wherein Huldreich Zwingli, the Swiss Reformer, was born in 1484, is still shown. The chief village is Lichtensteig (1387 inhab.), but those of Kirchberg (5025 inhab.) and of Wattwil (4971 inhab.) are the most populous. On the extinction of the main line of the local counts (1436), this portion of their dominions passed to the lord of Raron (in the Valais), who sold it in 1468 to the abbot of St Gall. (W.A.B.C.)

TOGO, HEIHACHIRO, Count (1847–), Japanese admiral, was born in Kagoshima. He studied naval science and navigation in England from 1871 to 1878, and first became a prominent figure when, in 1894, as captain of the cruiser "Naniwa," he sunk the Chinese troopship "Kowshing" *en route* for Korea, thus precipitating war with China. When the Russo-Japanese conflict broke out in 1904, he was appointed to the command-in-chief of the Japanese fleet, and under his direction various brilliant operations took place, culminating in the battle of the Sea of Japan when the Russian fleet was annihilated. For these services he received (1907) the title of count. In 1906 he was made a member of the British Order of Merit.

TOGOLAND, a German colony on the Gulf of Guinea, West Africa. It forms part of the territory formerly distinguished as the Slave Coast and was annexed by Germany in 1884. It is bounded S. by the Atlantic, W. by the British possessions on the Gold Coast, N. by the French colony of Upper Senegal and Niger, E. by Dahomey, also a French colony. (For map see French West Africa and Gold Coast). The coastline is only 32 m. in length (1° 14′ E. to 1° 38′ E.) but inland Togoland widens to three or four times that breadth. It contracts again at its northern boundary to about 30 m. From the coast northward the extreme length is 350 m. The area of the colony is some 33,700 sq. m. Pop. about 1,000,000. The white inhabitants numbered (1909) 330 of whom 300 were German. The boundary between Togo and Dahomey, by Franco-German agreement of 1897, follows the coast lagoon from Little Popo to the Mono river, ascends the middle of that river as far as 7° N., thence goes in a direct line to 9° N. and from that point in a north-westerly direction to 11° N. The western boundary was settled by Anglo-German agreements of 1890 and 1899; it leaves the coast west of the town of Lome and proceeds in a zigzag line to where the Deine river joins the Volta; thence follows the Volta to its junction with the Daka and then the Daka up to the point where 9° N. cuts the river. From this point the frontier follows a north-easterly course to 11° 8′ N., leaving the town of Yendi and the Chakosi territory on the German side of the boundary line. The agreement of 1899 defined the western boundary from 8° N. northward, and partitioned between the two powers a large block of territory, which by an agreement of 1888 had been declared a neutral zone. The northern frontier is a line drawn between the northernmost points of the eastern and western frontiers.

Physical Features.—The coast is low and sandy and is formed by the detritus deposited by the sea current called Calema. It is perfectly straight, without harbours, and approached only through a dangerous bar. This coast strip is nowhere more than 2 m. broad. It masks a series of lagoons, of which the largest, occupying a central position, is called the Togo, Avon or Haho lagoon. It is connected by a channel running eastward parallel with the sea, with the Wo and Little Popo lagoons, and with the Mono river. Behind the lagoons an undulating plain stretches some 50 m. The Sio and Haho, the two largest rivers of the coast region, both flow into the Togo lagoon. These rivers rise on the eastern versant of a chain of mountains which traverse the country in a south-westerly to north-easterly direction. Beginning in the south-east corner of the Gold Coast colony this range, composed of quartzites and schists, extends beyond the borders of Togoland into upper Dahomey. It has no general name, but in the south is called Agome. On the eastern side it presents a fairly continuous escarpment. It is most elevated in its southern portion, Mt Dabo having a height of 3133 ft. and Mt Atilakuse (in 7° 20′ N. 0° 43′ E.) 3248 ft. Its general elevation is between 2000 and 2500 ft.; on the north-west side of the range the country is table-land some 600 to 1000 ft. high. Baumann Spitze (3215 ft.) is an isolated peak in 6° 50′ N., 0° 46′ E., east of the main range. South and east of the range the country, apart from that watered by the coast streams, drains to the Mono river. The greater part of the colony lies west and north of the chain and belongs to the basin of the Volta. The chief river traversing it is the Oti, which rises in about 12° N., enters Togoland at its north-east corner, and runs with a very sinuous course south-south-west to its junction with the Volta in 7° 37′ N. For a considerable distance the left bank of the Volta itself is in German territory, but its lower course is wholly in the Gold Coast colony.

Climate.—The climate on the coast is hot, humid and unhealthy. There are two wet seasons, the first lasting from March till June, the second from September to November. Apart from the coast region, seasons of drought are not uncommon. The dry wind from the Sahara called harmattan, which carries great quantities of fine red sand, causes a fall of temperature in the (European) summer.

Flora and Fauna.—Coco-nut palms, introduced about the beginning of the 19th century by the Portuguese, grow along the coast and for 80 m. or so inland. The lagoons are surrounded by dense belts of reeds, and the coast-land is covered with low, impenetrable bush. There are considerable forests of oil palms, rubber trees and vines, and timber and dyewood trees. Many of the river valleys are densely wooded. On the hills the baobab and hyphaene palm are characteristic; on the plateau are stretches of open savanna, and park-like country with clumps of silk cotton and shea-butter trees. The fauna resembles that of other parts of West Africa; it is poor on the coast. Elephants and lions are found in the interior.

Inhabitants.—The inhabitants are negroes and negroids. In the north the people are mostly Hausa, in the west they belong to the Tshi-speaking clans, while on the coast they are members of the Ewe (Dahomey) tribes. Among the coast people there is a distinct infusion of Portuguese blood, and in all the ports are descendants of Brazilian negroes who returned to Africa during the 19th century. Pidgin English is the common language along the coast. The Adeli and Akposso hill tribes have a dialect of their own. In the north the tribes form small, well-organized states. In the coast lands the inhabitants are traders and agriculturists, in the interior they are largely pastoralists. The Hausa are often traders, traversing the country in large caravans. The inhabitants are partly Mahommedans, partly believers in fetish; comparatively few profess Christianity. As a rule the tribes are peaceful. Slave raiding has ceased, but domestic slavery in a mild form continues.

Towns.—The capital and chief port is Lome (pop. about 5000), near the western frontier. It is a creation of the Germans, the site, in 1884, being occupied by a small fishing village. It is provided with a jetty, is the sea terminus of the railway systems, the residence of the governor, and has churches, schools, hospitals and large business houses. The chief African traders are Hausa immigrants. Togo, which has given its name to the country, is a town on the south-eastern shores of the Togo lagoon. On the narrow spit of land between the lagoons and the sea are Bagida and Porto Seguro—the last named one of the oldest towns on the Slave Coast and the port of Togo town—and, close to the eastern frontier, Little Popo, called by the Germans Anecho. Anejo or Anecho means the houses or quarter of the Anes. The Anes are reported to have come from the Gold Coast by sea and to have been wrecked at this place. Little Popo dates from the 17th century or earlier. At the time of the German annexation Anecho was one of three distinct quarters into which the town was divided. In the hill country are the government stations of Misahöhe and Bismarckburg. On the Volta, a short distance above the Oti confluence, are the adjacent towns of Kete-Krachi; on an affluent of the Mono in 7° N. is Sagada. In the north are the large native towns of Yendi and Sansane Mangu, both on caravan routes between Ashanti and the Niger countries.

Agriculture and Trade.—The country is rich in natural products, and its resources have been largely developed by the Germans. It was the first German colony to dispense (1903–1904) with an imperial subsidy towards its upkeep. Several firms have acquired plantations in which coffee, cocoa, cotton, kola and other tropical products are cultivated. Coco-nut palms thrive; maize, yams, bananas, tapioca and ginger are cultivated by the natives. The chief trade is in, and the principal exports are, palm oil and kernels, rubber, cotton, maize, groundnuts (*Arachis*), shea-butter from the *Bassia parkii* (Sapotaceae), fibres of the *Raphia vinifera*, and the *Sansevieria guineensis*, indigo, and kola nuts, ebony and other valuable wood. In the interior cattle and sheep are plentiful, on the plateau horses and donkeys. The natives have several industries, including pottery, straw plaiting, smithwork and woodcarving. Some of their carving is very fine. They collect and spin the indigenous cotton, which is of good quality, and dye it with indigo or other pigments; they also manufacture very handsome shawls. Cotton growing under European direction began about 1900, with the result that in 1901–1902 over 100,000 lb of cotton grown from native, American and Egyptian seed were shipped to Bremen. In subsequent years the industry attained considerable proportions.

The imports are chiefly textiles, metals and hardware, and gin. Imports are mainly from Germany, exports to Germany and to other West African colonies. In 1908 the value of the imports was £425,000, of the exports £389,000.

Communications.—Good roads have been built connecting the coast towns with the principal places in the interior. A railway about 20 m. long connects Lome with Little Popo. From Lome another railway 76 m. long runs north-west to Agome-Palime near Misahöhe. There are telegraph and telephone lines between Lome and Little Popo, and both places are in telegraphic communication with the Gold Coast and Dahomey, and thus with the international cable system. There is direct steamship communication between Togoland and Hamburg, and the steamers of three French and two English lines call at Togoland ports.

Government, &c.—The colony is administered by a governor who is advised by a nominated council of unofficial members. Revenue is derived principally from customs duties, direct taxation being light. In 1907–1908 revenue and expenditure balanced at £103,000. A judicial system has been instituted to which natives as well as Europeans are amenable. The government maintains schools at all the coast towns. Various missionary societies have also established schools. In 1909 some 10,000 native children were receiving instruction.

History.—Before its annexation by Germany the lagoons were a favourite resort of slavers, and stations were established there by Portuguese, British, French and German traders. The coast natives were dependent on the rulers of Dahomey or Porto Novo. Little Popo and Togo were capitals of small independent kingdoms. Little Popo is said to have been founded in the 17th century by refugees from Accra, who were driven out by the Akwamu. At the time that "the scramble for Africa" began, the narrow strip of coast over which the king of Togo ruled was the sole district between the Gambia and the Niger to which Great Britain, France or some other civilized power had not a claim. At Togo Bremen merchants had trading stations, and taking advantage of this fact Dr Gustav Nachtigal, German imperial commissioner, induced the king of Togo (July 5, 1884) to place his country under German suzerainty. The claims made by Germany to large areas of the hinterland gave rise to considerable negotiation with France and Great Britain, and it was not until 1899 that the frontiers were fixed on all sides (see Africa, § 5). Meantime the development of the coast region had been taken in hand. On the whole the history of the colony has been one of peaceful progress, interrupted now and again, as in 1903, by severe droughts. At stated intervals the native chiefs are summoned to Lome to discuss administrative matters with the government.

See H. Klose, *Togo unter deutscher Flagge* (Berlin, 1899), a comprehensive survey, with bibliography; N. Seidel, *Die Küste und das Vorland der Togocolonie* (Berlin, 1897), and *Die Ewhesprache in Togo* (Heidelberg, 1906); Schönhärt, *Volkstümliches aus Togo* (Dresden, 1909); R. Büttner, *Die Forschungsstation Bismarckburg und Adeli* (1894); *Das deutsche Schutzgebiet Togo* (Bremen, 1891); L. Von Ammon, "Zur Geologie von Togo und vom Nigerlande" in *Mitteil. der geog. Gesell. in München* (1905); Klose, "Religiöse Anschauungen und Menschenopfer in Togo" in *Globus* 1902; P. Sprigade, *Karte von Togo*, scale 1:200,000, 12 sheets, also in 2 sheets on the scale 1:500,000 (Berlin, 1902–1907).

TOILET, the process or operation of dressing, also dress and its appurtenances, also applied, especially in the French form "toilette," to a particular costume worn by a lady. The word is adapted from French *toilette*, a diminutive of *toile*, cloth, Latin *tela*, web, woven cloth, from root of *texere*, to weave; this word survives in the English "toils," net, snare.[1] The earliest use of "toilet" and *toilette* is for a cloth, usually of linen or other fine material spread over a table when used to hold the looking-glass and all the other articles used in dressing, or for a small sheet or cloth thrown over the shoulders of a person while being shaved or having his or her hair dressed. It was thus applied especially to the various articles collectively which form the apparatus of a toilet-table or dressing-table. Dressing-tables or *toilettes* were articles of domestic furniture on which the 18th century cabinet makers and *ébenistes* of France lavished their decorative art. The escritoire and toilette combined which belonged to Marie Antoinette is in the Victoria and Albert Museum, South Kensington (see Furniture, Plate IV., fig. 4).

[1] "Toil," labour, fatigue, weariness, must of course be distinguished. The M. Eng. *toilen* appears to mean to pull, struggle, and is probably related to Scots *toilyie*, broil, and to Fr. *touiller*, to entangle, shuffle together, smear. It is, however, usually referred to "till," to cultivate, O. Eng. *tiolian*, from *til*, profitable, cf. Ger. *Ziel*, goal.

TOKAJ (or Tokay), a town of Hungary, in the county of Zemplén, 148 m. E.N.E. of Budapest by rail. Pop. (1900), 5104. It is situated at the confluence of the Bodrog with the Theiss, and gives its name to the famous Tokay wine. Tokaj lies at the foot of the Hegyalja Mountains, which stretch to the north and north-west of the town, between the rivers Hernad and Bodrog, for a distance of about 60 m. as far north as Eperjes. The northern part of the range is also called Sóvar Mountains. These mountains, which have in the northern part an altitude of 2700 ft., slope down towards the south-east near Tokaj in a hilly plateau of about 1500 ft. altitude, where the vineyard region is situated. This vineyard region covers an area of about 135 sq. m., and belongs to 21 adjoining communities. The soil is of volcanic origin (trachyte). The principal places where the wine is produced are Tarczal, Tálya, Mád, Liszka, Tokaj, Tolcsva, Sarόspatak, Keresztur, and Zsadaný. The yearly production averages 5,000,000 gallons. It is believed that the vine was introduced into this region by colonists from Italy and Morea in 1241.

TOKAT (Armenian *Evtoghia*, anc. *Dazimon*) the chief town of a sanjak of the same name in the Sivas vilayet of Asia Minor. It is situated in the Sivas-Samsun *chausée*, altitude 2280 ft., at the mouth of a rocky glen which opens out to the broad valley of the Tozanli Su, a tributary of the Yeshil Irmak. It rose to importance under the Seljuks. Pop. about 30,000, two-thirds Mussulman. The industries are the manufacture of copper utensils and yellow leather, and the stamping of colours on white Manchester cotton. Near Tokat copper pyrites, with iron and manganese, kaolin and coal are found; but most of the copper worked here comes from the mines of Keban Maden and Arghana Maden, on the upper Euphrates and Tigris. (D. G. H.)

TOKELAU (or Union Islands), a group of three atolls in the Pacific Ocean, about 350 m. N.E. of Samoa, belonging to Britain. Atafu consists of 63 islets, Nukunau of 93 and Fakaafo of 62. They produce little but copra. The natives are all Christians, and in type and speech are akin to the Samoans. They number about 500.

TOKEN MONEY, the term employed originally to describe the counters or "tokens" issued by traders to meet the lack of small change. It has now been appropriated by economists and officials to denote the smaller currency that circulates at a nominal value higher than its cost. It is contrasted with "standard" money, and is limited in its amount by state authority. Its power of discharging debts is also limited: in England, *e.g.*, silver is legal tender only up to 40s., copper to 12 pence. Various substances have been utilized for the manufacture of token coinage—silver at a lower degree of fineness, copper in different alloys, and nickel. The French term *monnaie divisionnaire* has much the same meaning; so has the German *Scheidemünze*. A currency, restricted in amount, but with full legal tender power—such as the Indian rupees and the French 5-franc pieces—is midway between token and standard money. Representative money also bears some analogy to token coinage. (See Money and Seigniorage.) (C. F. B.)

TOKUGAWA, the name of a Japanese family which provided the ruling dynasty of shōguns from 1603 until the revolution which restored the power of the mikado in 1867. The founder of this dynasty was Iyéyasu Tokugawa (1542–1616), a great general and consummate politician, who was connected by descent with the Minamoto clan. The most famous of the subsequent shōguns was his grandson Iyemitsu (from 1623 to 1650. (See Japan: *History*.)

TŌKYŌ (or Tōkiō, formerly called *Yedo*), the capital of the empire of Japan, situated in 35° 41′ N. and 139° 45′ E., at the head of the bay of the same name on the south-east coast of the main island. The city stands on the banks of the river Sumida, which, although pretty wide, is unnavigable by vessels of large tonnage owing to its shallowness. Yokohama, with which Tōkyō is connected by 18 m. of railway, is practically the port of the capital. Tōkyō is the centre from which several railways radiate. The trains of the Tokai-do line, starting from the Shimbashi station, run westwards to Kobe, thence to Shimonoseki, at the western end of the main island, a distance of 700 m. The Uyeno station is the starting-point for trains to Aomori, a town 460 m. away, at the northern extremity of the island. In 1907 a central station was designed to be built south of the imperial palace.

The climate is mild and healthy, and for the greater part of the year very pleasant, the seasons of spring and autumn being more especially delightful.

The area of Tōkyō is about 30 sq. m. Topographically it may be divided into two parts, upland and lowland (Yamanote and Shitamachi). There are hills varying in height from 50 to 130 ft. in the upland district; that is to say, the outskirts of the city from north to west. Lowland Tōkyō, that part of the city covering the flats on both sides of the river Sumida, is intersected by a system of canals. The bridges over the Sumida, and those which span the canals, have always been distinctive features of Tōkyō. The Nihon-bashi (Bridge of Japan), in the district of the same name, is by far the most famous. It is the point from which all distances in Japan are measured. The largest bridges are those named Azuma, Umaya, Ryogoku, Shin-o and Eitai over the Sumida.

The streets were formerly narrow and irregular, but the principal thoroughfares have been widened under the Street Improvement Act of 1888. Electric tramcars run throughout the city carrying passengers at a uniform rate of 4 sen, which means that it is possible to travel some 10 m. for one penny. The jinrikisha, drawn by one man or sometimes two men, which were formerly the chief means of passenger conveyance, have notably decreased in number since the introduction of the trams. Tōkyō has often experienced earthquakes, and more than once has suffered from severe shocks, which have hitherto prevented the erection of very large buildings. The numerous residences of the daimyos were the chief characteristics of the old town, especially in the Kojimachi-ku. Many of these have been demolished and government offices erected on their sites; others have given place to new streets and houses. Nearly in the centre of Kojimachi-ku, on an eminence, surrounded by moats, stood the castle of Yedo, formerly the residence of the shōguns, which was burnt down in 1873. The imperial palace was subsequently erected on this site. The palace is half European and half Japanese in its style of architecture. The Nijū-bashi is the main entrance. To the east and south of the palace the neighbourhood has undergone great changes in modern times. It was here, at the Sakurada Gate, that Ii Kamon-no-Kami, prime minister of the shōgun's government, was assassinated by the anti-foreign party in 1860. On the site of his residence a little higher up to the right of the gate now stand the war office and the offices of the general staff. In another street, leading from the gate, are the foreign office, the supreme court, the local court and the departments of justice and the navy. The temporary buildings of the Imperial Diet, which first met in 1890, are also in this part of the capital. Adjoining the above-named buildings is the Hibiya Park, modelled on the European style, while retaining the special features of the Japanese gardeners' art. The parks have always afforded to the people their chief means of recreation. The largest and most beautiful are those in Shiba and Uyeno, formerly the mausolea of the shōguns. In Uyeno, too, are the Imperial Museum, the Imperial Library and the Zoological Gardens. The famous temple of Kwannon, the goddess of mercy, is in the Asakusa Park, in which a permanent fair is held; it is a great holiday resort of the citizens. In Kudanzaka Park is the Yasukuni Temple, popularly known by the name of Shokonsha, and consecrated to the spirits of departed heroes who fell in war. In the same ground is a museum of arms, containing trophies of the wars with China and Russia.

Administration.—For administrative purposes Tōkyō is divided into fifteen districts or *Ku*, of which Kojimachi, Hongo, Koishikawa, Ushigome, Yotsuya, Akasaka, Azabu and Shiba are situated in the upland portion, while Kanda, Kiobashi, Nihonbashi, Shitaya, Asakusa, Honjo and Fukagawa are in the lowland. Suburban Tōkyō is divided into eight districts or *Gun*, which, with the city proper, collectively form the Tōkyō-Fu (prefecture), under the general control of one governor called Fu-Chiji. Questions affecting the interests of the whole Fu come before the *Fu-kwai*, or prefectural assembly, made up of representatives from both *Ku* and *Gun*, and a prefectural council, of which the governor is president; while matters concerning the city alone are discussed by a *Shi-kwai*, or municipal assembly, and administered by a municipal council, of which the Shicho or mayor is president. There is a regular water supply worked by the municipality. The reservoir at Yodobashi is capable of supplying water (from the river Tama) to all parts at a pressure varying from 80 to 100 ft. Hydrants are fixed in all the streets for the use of the fire brigade, which has a well disciplined and efficient personnel, and does not lack opportunities for the exhibition of its skill in a town built largely of wood. The police force is another well-trained and successful service. Both police and fire brigade are under the command of a single *Keishi-sokan* (inspector-general). The postal arrangements are very satisfactory, frequent deliveries being made with the utmost despatch. The telephone system is extensive, including long-distance wires to Yokohama, Osaka and other large towns. A complete and successful system of education exists. There are many schools for advanced students devoted to the various branches of science, mechanics and art. The imperial university of Tōkyō, which consists of the colleges of law, medicine, literature, science, engineering and agriculture, is the principal institution of learning in the empire. There are several daily newspapers as well as weekly and monthly publications of all kinds. In the lowland part of the city and in the suburbs there are many factories, their number having so much increased in recent years that Tōkyō may now be described as an industrial town.

Population.—There are no reliable data as to the population of Yedo during the shōgunate. Owing to the influx caused by the periodical visits of the daimyōs (feudal lords) with their numerous attendants, it probably exceeded $1\frac{1}{2}$ million during the early part of the 19th century. The population was 857,780 in 1880; 1,207,341 in 1890; 1,339,726 in 1895; 1,497,565 in 1900, and 1,969,833 in 1905.

History.—No mention is made of Tōkyō in Japanese history before the end of the 12th century. It appears to have assumed no importance till about 1457, when Ota Dokwan, a general in the service of Uyesugi Sadamasa, governor of Kamakura, built a castle here. About thirty years later the town fell into the hands of Hōjō of Odawara, and on his overthrow by Hideyoshi and Iyeyasu, the castle was granted to the latter, who was the founder of the shōgun house of Tokugawa. In 1590 Iyeyasu made his formal entry into the castle of Yedo, the extent of which he greatly enlarged. From this date the real importance of Yedo began. The family of the Tokugawas furnished the shōguns (or tycoons) of Japan for nearly three hundred years, and these resided during that period at Yedo. At the restoration in 1868 the shōgunate was abolished, and the population of Yedo speedily decreased. A fresh vitality was imparted by the transfer of the court from Kiōto, and the town then received its present name Tōkyō (eastern capital). (G. U.)

TOLAND, JOHN [christened JANUS JUNIUS] (1670–1722), English deist, was born on the 30th of November 1670, near Londonderry, Ireland. Brought up a Roman Catholic, in his sixteenth year he became a zealous Protestant. In 1687 he entered Glasgow University, and in 1690 was created M.A. by the university of Edinburgh. He then spent a short time in some Protestant families in England, and with their assistance went to Leiden University, to qualify for the dissenting ministry. He spent about two years studying ecclesiastical history, chiefly under the famous scholar Friedrich Spanheim. He then went to Oxford (1694), where he acquired a reputation for great learning and "little religion," although at the time he professed to be a decided Christian. While at Oxford he began the book which made him famous—his *Christianity not Mysterious* (1696, anonymous; 2nd ed. in the same year, with his name; 3rd ed., 1702, including an *Apology for Mr. Toland*). It gave great offence, and several replies were immediately published. The author was prosecuted by the grand jury of Middlesex; and, when he attempted to settle in Dublin at the beginning of 1697, he was denounced from the pulpit and elsewhere. His book having been condemned by the Irish parliament (Sept. 9, 1697) and an order issued for his arrest, Toland fled to England. The resemblance, both in title and in principles, of his book to Locke's *Reasonableness of Christianity*, led to a prompt disavowal on Locke's part of the supposed identity of opinions, and subsequently to the famous controversy between Stillingfleet and the philosopher. Toland's next work of importance was his *Life of Milton* (1698), in which a reference to "the numerous supposititious pieces under the name of Christ and His apostles and other great persons," provoked the charge that he had called in question the genuineness of the New Testament writings. Toland replied in his *Amyntor, or a Defence of Milton's Life* (1699), to which he added a remarkable list of what are now called apocryphal New Testament writings. In his remarks he really opened up the great question of the history of the canon. The next year his *Amyntor* and *Christianity not Mysterious* were under discussion in both houses of Convocation, and the Upper House declined to proceed against the author. In 1701 Toland spent a few weeks at Hanover as secretary to the embassy of the earl of Macclesfield, and was received with favour by the electress Sophia in acknowledgment of his book *Anglia Libera*, a defence of the Hanoverian succession. On his return from the Continent he published *Vindicius Liberius* (1702), a defence of himself and of the bishops for not prosecuting him. In this he apologized for *Christianity not Mysterious*, as a youthful indiscretion, and declared his conformity to the doctrines of the established Church. The next year he visited Hanover and Berlin, and was again graciously received by the electress and her daughter Sophia Charlotte, queen of Prussia, the "Serena" of the *Letters* published on his return to England (1704). In two of these (*A Letter to a Gentleman in Holland*, and *Motion essential to Matter*), ostensibly an attack on Spinoza, he anticipated some of the speculations of modern materialism. The *Account of the Courts of Prussia and Hanover* (1705) was used by Carlyle in his *Life of Frederick the Great*. From 1707 to 1710 Toland lived in varying circumstances on the Continent. In 1709 he published (at the Hague) *Adeisidaemon* and *Origines Judaicae*, in which, amongst other things, he maintained that the Jews were originally Egyptians, and that the true Mosaic institutions perished with Moses. After his return to England, he lived chiefly in London and latterly in Putney, subsisting precariously upon the earnings of his pen and the benevolence of his patrons. His literary projects were numerous (see Mosheim's *Vita*); his warm Irish nature appears in his projected history of the ancient Celtic religion and his chivalrous advocacy of the naturalization of the Jews. The last of his theological works were *Nazarenus, or Jewish, Gentile and Mahometan Christianity* (1718), and *Tetradymus* (1720), a collection of essays on various subjects, in the first of which (*Hodegus*) he set the example, subsequently followed by Reimarus and the rationalistic school in Germany, of interpreting the Old Testament miracles by the naturalistic method, maintaining, for instance, that the pillar of cloud and the fire of *Exodus* was a transported signal-fire. His last and most offensive book was his *Pantheisticon* (1720). He died on the 11th of March, 1721–1722, as he had lived, in great poverty, in the midst of his books, with his pen in his hand. Just before his death he composed an epitaph on himself, in which he claimed to have been "Veritatis propugnator, libertatis assertor." The words "Ipse vero aeternum est resurrecturus, at idem futurus Tolandus nunquam" seem to indicate his adherence to the pantheistic creed expounded in the *Pantheisticon*.

Toland is generally classed with the deists, but at the time when he wrote *Christianity not Mysterious* he was decidedly opposed to deism. The design of the work was to show, by an appeal mainly to the tribunal of Scripture, that there are no facts or doctrines of the "Gospel," or the "Scriptures," or "Christian revelation," which, when revealed, are not perfectly plain, intelligible and reasonable, being neither contrary to reason nor incomprehensible to it. It was intended to be the first of three discourses, in the second of which he was to attempt a particular and rational explanation of the reputed mysteries of the gospel, and in the third a demonstration of the verity of Divine revelation against atheists and all enemies of revealed religion. After his *Christianity not Mysterious* and his *Amyntor*, Toland's *Nazarenus* was of chief importance, as calling attention to the right of the Ebionites to a place in the early church, though it altogether failed to establish his main argument or to put the question in the true light. His *Pantheisticon, sive formula celebrandae sodalitatis socraticae*, of which he printed a few copies for private circulation only, gave great offence as a sort of liturgic service made up of passages from heathen authors, in imitation of the Church of England liturgy. The title also was in those days alarming, and still more so the mystery which the author threw round the question how far such societies of pantheists actually existed.

See Mosheim's *Vindiciae antiquae christianorum disciplinae* (1722), containing the most exhaustive account of Toland's life and writings; a *Life of Toland* (1722), by "one of his most intimate friends"; "Memoirs of the Life and Writings of Mr John Toland," by Des Maizeaux, prefixed to *The Miscellaneous Works of Mr John Toland* (London, 1747); John Leland's *View of the Principal Deistical Writers* (last ed. 1837); G. V. Lechler's *Geschichte des englischen Deismus* (1841); Isaac Disraeli's *Calamities of Authors* (new ed., 1881); article on "The English Freethinkers" in *Theological Review*, No. 5 (November, 1864); J. Hunt, in *Contemporary Review*, No. 6, June 1868, and his *Religious Thought in England* (1870–1873); Leslie Stephen's *History of English Thought in the Eighteenth Century*, vol. i. (1881), and article in *Dictionary of National Biography*; J. Cairns's *Unbelief in the Eighteenth Century* (1881). On Toland's relation to the subsequent Tübingen school, as presented in his *Nazarenus*, see D. Patrick in *Theological Review*, No. 59 (October, 1877); and on his relation to materialism, F. A. Lange's *Geschichte des Materialismus* (Eng. trans. by E. C. Thomas, 1877), and also G. Berthold, *John Toland und der Monismus der Gegenwart* (1876).

TOLEDO, a province of central Spain, formed in 1833 from part of New Castile; bounded on the N. by Ávila and Madrid, E. by Cuenca, S. by Ciudad Real and W. by Cáceres. Pop. (1900), 376,814; area 5919 sq. m. The surface is throughout lofty, and in a great part of its extent mountainous. Towards the centre there are extensive plains or tablelands, but the whole of the south and east is occupied by the Montes de Toledo, and the hills which separate the waters of the Tagus on the north from those of the Guadiana on the south. These mountains are of no great height; until late in the 19th century they were densely covered with forests. Toledo is well watered by the Tagus (*q.v.*) and its numerous affluents, including the Guadarrama and Alberche on the north and the Algodor, Torcon, Pusa and Sangrera on the south. The Giguela waters the eastern districts. Gold, silver, lead, iron, quicksilver, copper, tin and other minerals have been discovered, but the mining industry does not prosper and there is little export trade in agricultural products. The number of sheep, goats, asses and mules is large; dairy-farming and the breeding of draught oxen and fighting bulls are also practised. Bees and silkworms are kept in considerable number. Manufactures once flourished, but now silk and woollen cloth, earthenware, soap, oil, chocolates, wine, rough spirit (*aguardiente*), guitar strings and arms are almost the only articles made. There is also a small trade in charcoal and timber. The province is traversed by three lines of railway—that of Madrid-Seville-Cadiz in the east, Madrid-Toledo-Ciudad Real through the centre, and Madrid-Cáceres-Lisbon in the north.

TOLEDO, the capital of the Spanish province of Toledo and formerly of the whole kingdom, 47 m. by rail S.S.W. of Madrid, on the river Tagus, 2400 ft. above sea-level. Pop (1900), 23,317. Toledo occupies a rugged promontory of granite, washed on all sides except the north by the Tagus, which here flows swiftly through a deep and precipitous gorge. Towards the north the city overlooks the desolate Castilian plateau; beyond the river it is confronted by an ampitheatre of bare mountains, the Montes de Toledo. From a distance it has the aspect of a vast fortress, built of granite, defended by the river and by a double wall on the north, and dominated by the towers of its cathedral and alcázar. The absence of traffic in its maze of dark and winding alleys creates a silence uncommon in so large a city. There are few *plazas*, the principal open spaces being the arcaded Zocodover, described by Cervantes in the *Novelas ejemplares*; and some of the finest monuments of antiquity are hemmed in by meaner structures. The houses, tall, massive and sombre, are entered by huge iron-studded doors, and, owing to the extremes of heat and cold characteristic of the Castilian plateau, most of their windows open on a sheltered inner court (*patio*), the walls facing the street being often blank, though their monotony is sometimes relieved by carved Gothic or Moorish stonework. Nowhere, even in Spain, have the appearance and atmosphere of a Gothic city been preserved with so little change. Though the Moslems have left their imprint upon its architecture, and though many ancient buildings were destroyed after the Christian reconquest to make room for churches, convents and seminaries, Toledo as a whole remains as distinctively Gothic and medieval as Granada is Moorish, Madrid Castilian or Barcelona modern. It has also been from the earliest times the centre of Spanish Christianity, and its archbishop is styled *ex officio* "primate of all the Spains."

Principal Buildings.—The Tagus is spanned by two fortified Moorish bridges, the Puente de Alcántara, on the north-east, which was rebuilt in the 13th and 17th centuries, and the Puente de San Martin, on the north-west, founded in 1212 and rebuilt in 1390. The inner wall of the city is said to have been founded in the 7th century by the Visigothic King Wamba; much of its masonry is Moorish. Alphonso VI. of Castile added the outer wall in 1109. To the same period belongs the Mudéjar Puerta del Sol, the finest of several ancient gateways, among which the Puerta Visagra (1550, restored 1575), and the Puerta del Cambron (1102, restored 1576) are also interesting. The Puerta Visagra Antigua, a Moorish gateway of the 9th century, has been walled up, but its original form is preserved. The Alcázar, a huge square building with a tower at each corner and a fine arcaded *patio*, stands on the highest ground in Toledo, originally the site of a Roman fort. Built as a citadel by King Wamba and used as such by the Moors, it was converted into a palace by St Ferdinand (1200–1252) and was enlarged in the 15th and 16th centuries by Ferdinand and Isabella, Charles V. and Philip II. During the war of the Spanish Succession it was burned down (1710), but Cardinal Lorenzana restored it in 1775. After the French had burned it a second time in 1810, it was again rebuilt and in 1882 became a military academy. In 1887 a third fire was followed by a third restoration. Despite these successive disasters, part of the 15th and 16th century palace has been preserved, including a fine façade designed by Juan de Herrera, a gateway by Alonso de Covarrúbias and a staircase by Herrera and Francisco de Villalpando. The Ayuntamiento, or City Hall, is a 15th-century building with 17th-century alterations by Doménico Theotocópuli (el Greco). Some fine Moorish work is preserved in the Salón de Mesa (*c.* 1450); in the Taller del Moro, which dates in part from the 14th century and was long the workshop (*taller*) of masons employed in repairing the cathedral; and in the palace of the counts of Fuensalida.

More important architecturally than any of these secular buildings are the churches of Toledo, and especially its magnificent Gothic cathedral (for illustration see ARCHITECTURE). The cathedral occupies the site of a Visigothic church, which an inscription preserved in the cloister shows to have been dedicated to the Virgin by King Reccared, on the 12th of April 589. If the event thus commemorated were a reconsecration—and it was in 589 that Reccared was converted from Arianism to orthodoxy—the church may well have been the cathedral of Eugenius, Eladius, Ildefonso and Julian, the four Toledan bishops who were canonized, and the first of whom is said to have been a disciple of St Paul. From 712 until 1227 the Visigothic church was used by the Moors as their principal mosque. It was then razed by St Ferdinand, who founded the present cathedral in August 1227. The completion of the main fabric was delayed until 1493, while many of the chapels and other subordinate buildings were added even later; thus Renaissance and baroque features have been introduced into a design which was originally Gothic of the 13th century. Though sacked by the Comuneros in 1521 and by the French in 1808, the cathedral is still one of the richest and most splendid foundations in the Peninsula. The exterior is masked by adjacent buildings, its most impressive part being the western façade, flanked by two towers, of which one is unfinished while the other rises to a height of 295 ft. The interior is somewhat dwarfed in appearance by its immense width. It is 395 ft. long by 178 ft. broad, and is divided by 84 pillars into five naves, with central lantern and choir, and a complete series of side chapels. Most of the chapels date from the 15th and 16th centuries, and are very magnificent in detail. The superb stained-glass windows, chiefly of Flemish work, belong to the same period and number 750. The choir-stalls, placed in alabaster recesses divided by columns of red jasper and white marble, are among the finest extant examples of late medieval and Renaissance wood-carving, though rivalled by the *retablo*, which rises behind the high altar to the roof. The treasury, reliquaries and library, notwithstanding their repeated despoilings, contain many priceless MSS. and works of art, including the custodia executed by Enrique de Arfe in 1524, which is nearly 10 ft. high and is adorned with 260 silver-gilt statuettes. In it is a monstrance, said to have been wrought from the first gold brought home by Columbus. There are paintings by many masters, including Goya, El Greco, Titian and Rubens. In the Mozarabic chapel mass and other offices are still performed daily according to the Mozarabic liturgy, which was also used in six of the parish churches until the middle of the 19th century. (See MOZARAB.) Within the precincts of the cathedral are interred the archbishops and cardinals Tenorio, Fonseca, Mendoza, Ximenez, the great constable Alvaro de Luna and a long array of kings and heroes. In the principal tower is hung the *campana gorda*, a bell weighing nearly two tons and said to be audible as far as Madrid. A huge wooden rattle (*matraca*) is used to summon worshippers between Maundy Thursday and the Saturday before Easter.

Apart from the cathedral, many of the other churches are of great interest and beauty. The Franciscan convent and church of San Juan de los Reyes (florid Gothic) were founded in 1476 by Ferdinand and Isabella, who intended the church to be their own burial-place; but after the erection of a royal mausoleum in Granada the fabric remained incomplete until the 17th century. El Cristo de la Luz was originally a mosque, built in 922 and incorporating some pillars from an older Visigothic church. Santo Tomé, also a mosque, was reconstructed in the Gothic style during the 14th century. El Cristo de la Vega, formerly known as the Basilica de Santa Leocadia, occupies the site of a Visigothic church built in the 4th century to mark the burial-place of the saint, whose reputed remains, like those of St Eugenius, are enshrined in the cathedral—here several church councils were held, but the original church was destroyed by the Moors and the present building dates principally from 1816. The Mudéjar Santa Maria la Blanca became successively a synagogue, in the 13th and 14th centuries, a church (1405), an asylum for women (1550), barracks (1791–1798) and again a church. El Tránsito, a Mudéjar synagogue (*c* 1365) was occupied by the knights of Calatrava in 1492, and was afterwards dedicated to the Passing (*Tránsito*) of the Virgin. Its inner walls are adorned with Moorish arabesques. It was restored after the ceiling, of cedar inlaid with ivory, had fallen in 1903. Santiago del Arrabal dates from the 11th century and has a Moorish tower. Some admirable Renaissance sculpture is preserved in the court and staircase of the former hospital of Santa Cruz (1494–1514), which was restored in 1906, to be used as a provincial library and museum. The Hospital de San Juan Bautista, outside the walls, was founded in 1541.

Toledo was the seat of a university from 1498 to 1845, and is still an important educational centre, having numerous elementary schools, a military academy and a provincial institute; it also contains the provincial court of justice and several modern hospitals. Its characteristic industry is the manufacture of swords, carried on by private firms and especially in the royal factory (1788), which, like the railway station, is about 1 m. from the city. Toledan blades have been famous for 2000 years, the *culter toletanus* being mentioned in the *Cynegetica* of Grattius (Faliscus), during the 1st century B.C. The industry throve under the Moors and especially during the 16th century; it is now practised on a smaller scale, but the blades produced are still remarkable for flexibility and strength.

History.—Toledo is of immemorial antiquity; Spanish legend variously ascribes its foundation to Hercules, to Tubal, the grandson of Noah, to "Iberia, daughter of Hispanus," and to Jews who, having been exiled by Nebuchadrezzar, settled here, naming their city *Toledoth*, the "city of generation." It was a stronghold of the Carpetani and may have been a Carthaginian trading-station. Livy (xxv. 7) mentions *Toletum* as *urbs parva, sed loco munita*, which was captured by the Romans in 193 B.C. Under Roman rule it became a *colonia* and the capital of Carpetania. Various fragmentary remains have been preserved, including parts of an aqueduct, of a circus, which seems never to have been completed, and of a temple (the so-called Cave of Hercules). Toletum was never captured by the Vandals. Its ecclesiastical importance is coeval with the introduction of Christianity into Spain; numerous church councils (see below) were held here, notably in 396, 400 and 589, and here was the chief battle-ground in the long political and religious struggle which ended (589) in the triumph of Spanish Catholicism over Arianism. From the reign of Athanagild (534–547) until the Moorish conquest in 712, Toletum was generally regarded as the capital of Visigothic Spain. The Moorish chroniclers grow eloquent over the treasures captured by Musa and his army in 712; these are said to have included the "Table of Solomon," carved from a single flawless emerald, and a copy of the *Psalms*, written upon gold with ink made from melted rubies. *Tolaitola*, as the city was now called, prospered under the Moors, first as a provincial capital in the caliphate of Cordova, governed by an emir (712–1035), afterwards as an independent state (1035–1085). Its rulers protected the large Jewish colony, founded extensive silk and woollen industries, and made their city an important centre of Arab and Hebrew culture, one of the great names associated with it being that of Rabbi ben Ezra (1119–1174). The Spanish and Jewish inhabitants adopted the language and many customs of their conquerors, becoming "Mozarabs," but retaining their own creeds. In 1085 Alphonso VI. of Leon and Castile captured Toledo, aided by the Cid, and in 1087 made it his capital. For a time the Castilians emulated the tolerance of the Moors, but the Jews were expelled in 1492 and the Arabic language was forbidden (except in church services) in 1580. Before this the archbishops of Toledo had become almost independent of any secular power; they possessed enormous wealth and some of them, such as the Cardinal Jimenez de Cisneros, directed the policy and even led the armies of all Spain. In 1521 Toledo was the centre of the revolt of the Comuneros (see SPAIN: *History*); its commercial and political decline dates from 1560, when Philip II. chose Madrid as his capital. The city was the home of Lope de Vega (1562–1635) and forms the scene of several of his dramas. It suffered severely during the Peninsular War, being several times occupied by the French in 1808–1812.

See J. Ibañez Marin, *Recuerdos de Toledo* (Madrid, 1893); H. Lynch, *Toledo* (London, 1898); A. F. Calvert, *Toledo* (London, 1907).

TOLEDO, a city and port of entry, the county-seat of Lucas county, Ohio, U.S.A., on both banks of the Maumee river, about 4 m. from Maumee Bay, Lake Erie, and about 95 m. W. of Cleveland. Pop. (1900), 131,822, of whom 1710 were negroes, and 27,822 were foreign-born, including 12,373 Germans, 2449 English Canadians, and 1636 English; (1910 census) 168,497. Area, 28·57 sq. m. Toledo is served by the Ann Arbor, the Cincinnati, Hamilton & Dayton, the Cleveland, Cincinnati, Chicago & St Louis, the Detroit, Toledo & Milwaukee, the Detroit & Toledo Shore Line, the Hocking Valley, the Lake Shore & Michigan Southern, the Michigan Central, the Pennsylvania, the Père Marquette, the Toledo, St Louis & Western, the Wabash, and the Wheeling & Lake Erie railways, by a "belt line" (30 m. long), the Toledo Railway & Terminal Company, by ten interurban electric railways (about 585 m.), and by the Wabash & Erie and the Miami & Erie canals. A channel 400 ft. wide and 21 ft. deep admits the largest vessels from Lake Erie to the city. Six passenger and freight steamship lines communicate with Cleveland, Buffalo, Sandusky, Detroit, Port Huron, Alpena, Mackinac, Georgian Bay and other points on the Great Lakes, and the city has 25 m. of docks. The city park system includes Ottawa Park (280 acres), Bay View Park (202 acres), Riverside Park (118 acres), Central Grove Park (100 acres), Collins Park (90 acres), Walbridge Park (67 acres), with a zoological collection, Navarre Park (53 acres), several smaller parks and triangles, and a boulevard, 18 m. long (incomplete in 1910), connecting the parks. Noteworthy public buildings are the County Court-house, the Public Library (about 85,000 volumes in 1910), the Soldiers' Memorial Building, the Toledo Club and the Toledo Museum of Art (1901). The city is the seat of Toledo University, including Toledo Medical College (1880), which is affiliated, for clinical purposes, with the Toledo Hospital (1876). There are numerous hospitals and charities.

Toledo is the port of entry for the Miami customs district and is an important shipping point for the iron and copper ores and lumber from the Lake Superior and Michigan regions, for petroleum, coal, fruit, and grain and clover-seed. In 1909 the imports of the port were valued at $642,286 and the exports at $600,794. The capital invested in manufacturing under the factory system in 1905 was $38,643,390 (62·4 % more than that of 1900). The value of the factory products in 1905 was $44,823,004 (40·2 % more than in 1900). Foundry and machine-shop products ($4,087,497) were the most valuable manufactures in 1905. In flour and grist mill products (value in 1905, $3,676,290) Toledo is the most important city of the state. Other important manufactures in 1905 were petroleum products ($2,006,484); lumber and planing mill products ($1,604,274); women's clothing ($1,477,648); children's carriages and sleds ($1,465,599); car-shop construction and repairs, by steam railway companies ($1,366,506); carriages and wagons ($1,225,387); structural iron work ($1,102,035); agricultural implements, bicycles, automobiles (a recent and growing industry), plate and cut-glass (made largely from a fine quality of sand found near the city), tobacco, spices and malted liquors. The building of boats, and of large vessels is also an important industry. At Rossford (pop. about 400), a suburb, is the large plant of the Ford plate-glass works. The water supply is derived from the Maumee river and is filtered by a municipal filtration plant.

The administration of the city became famous after 1897 when Samuel Milton Jones (1846–1904), a manufacturer of oil machinery, was elected mayor by the Republican party; he was re-elected on a non-partisan ticket in 1899, 1901 and 1903, and introduced business methods into the city government. His honesty and sincerity in business and politics gained him the nickname "Golden Rule" Jones. The independent movement which he started was carried on under Brand Whitlock (b. 1869), a lawyer and writer who was mayor of Toledo in 1906–1911. The city council has 16 members, three elected at large and the others by wards, and there are boards of public service, public safety, public health and education.

The site of Toledo lies within an immense tract of land, constituting sixteen reservations, acquired by the United States government from several Indian tribes in 1795, and a stockade fort, called Fort Industry, was built here about 1800. In 1817 two companies bought from the government a portion of the tract, at the mouth of Swan Creek, including most of the land now occupied by Toledo. Upon the tract farthest up-stream the town of Port Lawrence was laid out (in 1817). In 1832 a rival company laid out the town of Vistula on the tract immediately below Port Lawrence, in the following year these towns were united and were named Toledo, and in 1837 the city was incorporated. The "Toledo War" was a dispute over the boundary between Ohio and Michigan. When Ohio Territory was organized in 1800 its northern boundary was described as a line drawn from the southern extremity of Lake Michigan due east to the Pennsylvania line, and the official map of the time placed the southern end of Lake Michigan at 42° 20′ N. lat. The state constitution adopted in 1802 followed the enabling act in accepting this line, but made the proviso that if it should not intersect Lake Erie east of the mouth of the Miami river, then the northern boundary should be a line from the southern end of Lake Michigan to the most northern cape of Maumee Bay and thence to the Territorial line, and to the Pennsylvania line. In 1805 the Territory of Michigan was organized with a southern boundary in accordance with the line extending due east from the southern end of Lake Michigan; and therefore there was in dispute a strip of land, about 5 m. wide at its western end and about 8 m. wide at its eastern end, a rich agricultural region, stretching across portions of what are now Lucas, Fulton and Williams counties, and including all of what are now Ashtabula and Lake counties, and portions of Geauga and Cuyahoga counties, in Ohio. Within the belt lay what is now Toledo, and its great importance as a lake port was even then clearly recognized. On the 29th of January 1818 the Ohio legislature accepted the "Harris line" (surveyed in 1817 in accordance with the proviso of the state constitution) as the northern boundary of the state. Acting on the recommendation of Governor Robert Lucas (1781–1853), on the 23rd of February 1835 the Ohio legislature passed an Act extending the northern boundaries of what were then Wood, Henry and Williams counties (lying partly within the disputed strip) north to the Harris line, and providing for the organization of new townships within this added territory, and for the appointment of three commissioners to re-mark the line. Upon the appointment (March 9, 1835) by Governor Lucas of the three commissioners to re-mark the Harris line, Governor Stevens T. Mason of Michigan ordered out a division of Michigan militia, which near the end of March entered and took possession of Toledo. A division of Ohio militia marched to Perrysburg, on the Maumee river, about 10 m. south of Toledo; but both militias disbanded when Richard Rush, of Philadelphia, and Benjamin C. Howard, of Baltimore, appeared at Toledo as peace emissaries, appointed by President Jackson. In April several members of the party accompanying the Ohio commissioners were arrested by Michigan militia. In June the Ohio legislature created Lucas county, mostly from the disputed territory, and made Toledo its county-seat. President Jackson now urged Michigan to discontinue interfering with the re-marking of the Harris line, and requested Ohio to postpone putting into effect the Act of February 1835; but as petty outbreaks continued throughout the summer and an Ohio judge and court officers at Toledo were arrested in September, he peremptorily removed Governor Mason from office. In June 1836 Congress decided the dispute in favour of Ohio, and in 1837 Michigan was admitted to the Union as a state upon condition of relinquishing all claim to the disputed territory, but received what is now known as the Upper Peninsula (the land between Lakes Superior, Huron and Michigan).

TOLEDO, COUNCILS OF (*Concilia toletana*). From the 5th to the 16th century about thirty synods, variously counted, were held at Toledo in Spain. The earliest, directed against Priscillianism, assembled in 400. The "third" synod of 589 marked the epoch-making conversion of King Reccared from Arianism to Roman Catholicism. The "fourth," in 633, probably under the presidency of the noted Isidore of Seville, regulated many matters of discipline, decreed uniformity of liturgy throughout the kingdom and took stringent measures against baptized Jews who had relapsed into their former faith. The "twelfth" council in 681 assured to the archbishop of Toledo the primacy of Spain. As nearly one hundred early canons of Toledo found a place in the *Decretum Gratiani*, they exerted an important influence on the development of ecclesiastical law. The synod of 1565 and 1566 concerned itself with the execution of the decrees of Trent; and the last council of Toledo, that of 1582 and 1583, was so guided in detail by Philip II. that the pope ordered the name of the royal commissioner to be expunged from the acts.

See *Canones apostolorum et conciliorum saeculorum, iv., v., vi., vii., rec.* H. T. Bruns, *pars prior* (Berlin, 1839), critical text of seventeen councils of Toledo (A.D. 400–694); P. B. Gams, *Die Kirchengeschichte von Spanien* (Regensburg, 1862–1879); E. H. Landon, *A Manual of the Councils of the Holy Catholic Church*, revised ed. (London, 1893), 151–169. These two summarize the chief canons. Neher, in Wetzer and Welte's *Kirchenlexicon* (1855–1857), vol. xi. (2nd ed. Freiburg, 1899), gives a list of 29 synods. (W. W. R.*)

TOLENTINO (anc. *Tolentinum Picenum*), a town of the Marches, Italy, in the province of Macerata, 11 m. by rail W. by S. of that town. Pop. (1901), 5111 (town), 13,197 (commune). It is situated on the Chienti, 735 ft. above sea-level, and was once a fortified town of great strength. The cathedral has a fine portal by the Florentine Giovanni Rosso (1435), and contains the remains of S Nicholas of Tolentino (d. 1309), whose Renaissance tomb and frescoes illustrating the life of the saint by Lorenzo and Jacopo da San Severino are preserved in a room adjoining the chapel north of the high altar. The church of San Catervo contains the early Christian sarcophagus of that saint, which is embellished with curious reliefs. The Museo Civico contains antiquities discovered during excavations near the town (in 1880–1884) in the Picene necropolis, dating from the 8th–4th centuries B.C. The town is the birthplace of the condottiere Niccolo Mauruzzi, and of the learned Francis Philelphus, one of the first disseminators of classical literature, who was born in 1398. At Tolentino the treaty was made between Bonaparte and the pope in 1797, by which the pope ceded Avignon; and here in 1815 a battle was fought in which the French under Murat were defeated by the Austrians.

TOLERATION (from Lat. *tolerare*, to endure), the allowance of freedom of action or judgment to other people, the patient and unprejudiced endurance of dissent from one's own or the generally received course or view.

TOLFA, a town of the province of Rome, Italy, 10 m. E.N.E. of Civitavecchia by road, 1558 ft. above sea-level. Pop. (1901), 3956. It is the chief place in the Tolfa Mountains, an extinct volcanic group between Civitavecchia and the Lake of Bracciano. Vapours are emitted which deposit sulphur and alum, and some mining is carried on. The output of alum averages 4000 to 5000 tons a year, and is mostly exported from Civitavecchia.

TOLL, JOHAN KRISTOFFER, COUNT (1743–1817), Swedish statesman and soldier, was born at Mölleröd in Scania. Toll came of a very ancient family, of Dutch origin, which can be traced back to the 13th, but migrated to the Baltic provinces in the 16th century. Toll's father was one of Charles XII.'s warriors, his mother a descendant of the aristocratic Gyellenstjernas. In his youth Johan Kristoffer served in the Seven Years' War, and then, exchanging the military for the civil service, became head ranger of the county of Kristianstad. During the riksdag of 1771–1772 the dominant "Caps" deprived him of his post, and Toll, shrewdly guessing that the king was preparing a revolution, almost forced his services on the conspirators, Göran Magnus Sprengtporten (*q.v.*) declaring that a man who knew so much of their most secret plans must either "be killed or squared." To Toll was assigned by far the most difficult part of the enterprise. It was his business to secure the important southern fortress of Kristianstad. Two days after the coronation, on the 31st of May 1772, he set forth from Stockholm with twenty-two pounds wherewith to corrupt a garrison and revolt a province. He had no sort of credentials, and the little that was known about him locally from the official point of view was not to his credit. Finally, in the fortress itself there was but one man known to be a safe royalist, namely, Captain Abraham Hellichius. On the 21st of June Toll reached Kristianstad. By sheer bluff Toll first won over Hellichius, and, six weeks later (August 12), the whole garrison of Kristianstad, arresting the few officers who proved recalcitrant; taking possession of the records and military chest, and closing the gates in the face of the "Cap" high commissioner who had been warned by the English minister, John Gooderich, that something was afoot in the south. Seven days later Gustavus III.'s *coup d'état* at Stockholm completed the revolution. Toll was liberally rewarded and more and more frequently employed as his genius as an administrator and his blameless integrity came to light. His reforms in the commissariat department were epoch-making, and the superior mobility of the Swedish forces under Gustavus III. was due entirely to his initiative. But it was upon Toll's boundless audacity that Gustavus chiefly relied. Thus as Gustavus, under the pressure of circumstances, inclined more and more towards absolutism, it was upon Toll that he principally leant. In 1783 Toll was placed at the head of the secret "Commission of National Defence" which ruled Sweden during the king's absence abroad without the privity of the senate. It was he who persuaded the king to summon the riksdag of 1786, which, however, he failed to control, and in all Gustavus's plans for forcing on a war with Russia Toll was initiated from the first. In 1786 he had already risen to the rank of major-general and was Gustavus's principal adjutant. It was against Toll's advice, however, that Gustavus, in 1788, began the war with Russia. Toll had always insisted that, in such a contingency, Sweden should be militarily as well as diplomatically prepared, but this was far from being the case. Nevertheless, when the inevitable first disasters happened, Toll was, most unjustly, made a scapegoat, but the later successes of the war were largely due to his care and diligence as commissary-general. After the death of Gustavus III. Toll was for a short time war minister and commander-in-chief in Scania and, subsequently, was sent as ambassador to Warsaw. Unjustly involved in the so-called "Armfelt conspiracy," he was condemned to two years' imprisonment; but was fully reinstated when in 1796 Gustavus IV. attained his majority. At the riksdag of Norrköping, 1800, he was elected marshal of the Diet, and led the royalist party with consummate ability. On this occasion he forced the mutinous *riddarhus* to accept the detested "Act of Union and Security" by threatening to reveal the names of all the persons suspected of complicity in the murder of the late king. Subsequently he displayed great diplomatic adroitness in his negotiations with the powers concerning Sweden's participation in the war against Napoleon. In the Pomeranian campaign of 1807 Toll assisted in the defence of Stralsund. The fortress was compelled to surrender on the 20th of August by Marshal Brune, whereupon the Swedish army of 13,000 men, which had retired to Rügen, seemed irretrievably lost. It was saved by Toll, who cajoled the French marshal into a convention whereby the Swedish army, with all its munitions of war, was permitted to return unmolested to Sweden (September 7). For this exploit Toll received his marshal's bâton. It was in the camp of Toll, then acting commander-in-chief in Scania, that Gustavus IV. was about to take refuge when the western army rebelled against him, but he was arrested in the capital before he could do so. Toll retained his high position under Bernadotte, who, in 1814, created him a count. He died unmarried.

See R. Nisbet Bain, *Gustavus III. and his Contemporaries* (London, 1895); K. N. Liliekrona, *Fältmarskalken Grefve J. K. Toll* (Stockholm, 1849–1850). (R. N. B.)

TOLL (etymologically, that which is numbered or counted; from a common Teutonic form, cf. "tale," "tell"), a sum of money paid for the use and enjoyment of a privilege or advantage. In England it is now usually a sum of money; but formerly tolls in kind were frequent. Among the sins of the Miller in Chaucer's Prologue is that he could "tollen thryes," in that he was clever enough and rogue enough to subtract thrice the legal allowance from the corn he ground. In a note to the *Heart of Midlothian*, Scott asserts that the name of Lockman given in Old Scots to the hangman was because he was entitled to take a *lock* or fixed toll out of every boll of meal exposed in the market for sale. An act of 1796 for the regulation of mills, substituting a money payment for tolls of corn in kind taken by millers, makes an exception for tolls taken by custom in soke mills. The Weights and Measures Act 1878 enacts that all tolls are to be charged and collected according to imperial weights and measures.

The word "toll" in early times had various meanings, thus it is defined by Glanville as the liberty of buying and selling in one's own land: "*tol, quod nos vocamus theloneum, scilicet libertatem emendi et vendendi in terra sua.* It also signified the right to be free of toll, but this implies a more general signification of the term, the right to take and the thing so taken. It formed the most obvious source of revenue in the early English boroughs; goods coming to market or passing through the borough paid toll, to this extent the practice still exists in various European countries under the name of *octroi* (*q.v.*). Private lords also levied tolls, but these in no case were levied theoretically at pleasure, all ultimately depending upon some real or feigned grant from the Crown. Imposts by the Crown are more properly taxes, though the name was frequently used, as in *maletote*, an arbitrary and vexatious impost levied till Edward III.'s time, usually on wool. Such payments might bring freedom from other exactions. We learn from Domesday Book that the men of Dover who paid the king's dues there were quit of toll throughout all England. Many subsequent charters granted the like, or even greater immunities from toll to favoured folk. In modern English law toll is either an incident of a franchise, as of a market or fair, or is independent of franchise. In the latter case it is claimed by prescription, as toll traverse or toll thorough, or is created by act of parliament, as in the case of turnpikes, railways, harbours, navigable rivers and canals. Toll traverse is paid for passing over a private way, bridge or ferry. No consideration need be proved. Toll thorough is paid for the use of a highway. In this case, if charged by a private person, some consideration, such as repair of the highway, must be shown, as such a toll is against common right. At common law a toll must be reasonable. The same principle appears in various acts of parliament. The Statute of Westminster the First inflicts a penalty for taking excessive toll. The Railway Clauses Act 1845 provides for the equality of tolls, that is, that all persons and classes of goods shall in like circumstances be treated alike as to charges. A right of distress is incident to the right to toll, but the distress cannot be sold unless an act of parliament expressly authorizes the sale. Tolls are not rateable, unless they are appurtenant to land. Exemption from tolls may be claimed by the prerogative, by grant or prescription, or by act of parliament. The king and queen consort pay no toll, and the Crown may grant to another exemption from toll. Turnpike tolls, bridge money and causeway mail were abolished in Scotland by the Roads and Bridges Act 1878 as from the 1st of June 1883. In England tolls on roads and bridges are now only payable in a few places.

In the United States tolls are a subject for state legislation, unless they affect the whole commonwealth, when they are dealt with by acts of congress. A city may levy reasonable tolls in a market established by itself. A *shunpike*, or road constructed to facilitate evasion of tolls on a turnpike road, may be closed by injunction.

The question of tolls was at one time an important one in international law. Tolls were exacted on certain straits and tidal rivers by virtue of the sovereignty of a particular state. Notable instances were the Scheldt tolls and the Sound dues levied by Denmark. These last were justified as a return for the lights maintained on the coast and the terror to pirates inspired by the castle of Elsinore. In 1659, owing to the united efforts of England, France and Holland, an unvarying rate was arranged.

See Pollock and Maitland, *History of English Law* (1895); Pease and Chitty, *Markets and Fairs* (1899); Cunningham, *Growth of English Industry and Commerce* (1903).

TOLLEMACHE (or TALMASH), **THOMAS** (*c.* 1651–1694), British soldier, was the second son of Sir Lionel Tollemache, Bart. (d. 1668), of Helmingham, Suffolk, although an idle report of the time made his mother, Elizabeth Murray (d. 1698), afterwards countess of Dysart and duchess of Lauderdale, the mistress of Oliver Cromwell. In 1678 he became captain in the Guards, with which he served in Tangier, and in 1685 he was made lieutenant-colonel of a regiment of fusiliers, but almost at once he gave up his commission because he disliked the proceedings of James II., and became colonel of an Anglo-Dutch regiment, usually stationed in Holland. At the head of his men he landed in England with William of Orange in 1688 and was made governor of Portsmouth and colonel of the Coldstream Guards, while in 1689 he was chosen an English member of parliament. With the Coldstreams he served William III. at the battle of Walcourt, and then as a major-general in Ireland, where in 1691 he gained fame at the battle of Aughrim and at the sieges of Athlone, Galway and Limerick. He then went to the Netherlands and added to his high reputation by his conduct at the battles of Steenkirk and Neerwinden. In 1694 Talmash, as he was generally called, proposed an expedition against Brest, the leadership of which was given to him. The fortifications, however, were too strong, and although he led on the English troops with great gallantry they were beaten off with heavy loss. Talmash himself was wounded, and returning to Plymouth he died there on the 12th of June 1694. He was buried in Helmingham church, where a long inscription summarizes his life.

TOLSTOY, LEO (1828–1910), Russian novelist and social reformer, was born on the 9th of September (August 28) 1828, in the home of his fathers—Yasnaya Polyana, near Toula—a large country house (not the present one) built in a severely formal style, with Doric pillars and architraves, standing solitarily in a typical Russian landscape. The Tolstoy family, to whom it had belonged for several generations, was originally of German extraction, and had settled in Russia in the days of Peter the Great. The first ancestor of distinction was Petr Andreevich Tolstoy (*q.v.*). His descendant Nicholas (the father of the great author) was born in 1797. After serving for a short time in the army he retired in 1824, and led the life of a Russian boyar. By his marriage with the princess Maria Volkonsky, Count Nicholas in a great measure rebuilt the family fortunes, which had fallen into decay during the two previous decades. Count Leo Tolstoy was the youngest but one of the five children of this marriage, and lost his mother when he was barely three years old. Six years later his father died also, at the age of forty-one. As a child, Tolstoy, though observant and thoughtful, showed no marked talent. He was plain and very sensitive on the point, suffering keenly for want of notice and affection. This sensitiveness led him as he grew older to hide himself away from his playmates and spend hours in lonely brooding. He describes in *Childhood* how, one day, it dawned suddenly upon his mind that Death was ever lying in wait, and that to be happy one must enjoy the present, unconcerned with the future. Whereupon the youthful Epicurean flung aside his books and pencils, and, stretched on his bed, fell to munching sweetmeats and reading romances. But Tolstoy's childhood was not without its share of wholesome pleasure. Hunting and shooting, the delight of the Russian noble, occupied much of his father's leisure, and from his earliest years the boy was wont to accompany his parent. At other times he was quite happy sitting beside his father's coachman on an expedition to one of the neighbouring towns, or with his brothers running in and out of the stables and coach-houses. The tedium of the schoolroom and the reproofs of his tutor made a reverse side to the picture, but did not prevent this fund of early memories from being, as he writes, "ever to be treasured, and fondled again and again, serving as a well-spring from which to draw my choicest treasures." After his father's death at Moscow, in 1837, Tolstoy and his brothers were placed under the guardianship of his aunt, the countess Osten-Sacken, and in the care of Mme Ergolskaya, a distant relative. The former died, however, in 1840, and the charge devolved on another aunt, Mme Jushkov, who lived in Kazan. Mme Jushkov was a typical Russian lady of her class. Keeping open house, fond of gaiety and society, her ideas on moral questions were liberal in the extreme. Tolstoy was eleven years old when he became subject to her influence—an influence which he subsequently regarded as having been the reverse of beneficial. A French tutor was engaged for him and his brothers, prior

Childhood.

to their entrance into the university of Kazan. Outside the hours of study Tolstoy spent his days either in solitary rambles, during which he reflected on the problems of life, or in violent exercise at the gymnasium (the only form of athletics enjoyed by boys of his position in Russia). Thus the physical and philosophical impulses of his nature were developed in equal measure, and these two conflicting forces began their lifelong duel. Only in later years has the philosopher sometimes seemed to outweigh the man of action in Tolstoy's vigorous personality.

At College.

In 1843, at the age of fifteen, he entered the university of Kazan, and gained with his college cap and uniform what he prized most, his independence. The lax rule of the university—which was of no high scholastic repute, giving ready admittance to the sons of the rich and noble—enabled him at the same time to enter the world of society and study its complex problems at leisure. Kazan was in those days a real paradise for such as sought happiness in social excitement, dining and dancing. No city in Russia was so given up to the pursuit of pleasure. Among these scenes of luxury and licence the students played a prominent part. Amid such influences the boy soon ripened into the man. The constant succession of balls, picnics and parties wearied and disgusted him. The pages of *Youth* are eloquent of deadly ennui. He is for ever seeking "Her," engaged in an undefined "pursuit of the Well-beloved," with a half spiritual, half physical longing. At intervals in this quest of the unknown he devoured the novelists of his day, chiefly Dumas and Eugène Sue. He already thought deeply on the object of existence; forming new ideals, aspiring to noble deeds, seeing himself in imagination now a passionate lover, now a leader of men. He was always trying to be original, and to tread unbeaten tracks. Partly in consequence of this feeling, he determined to enter the school of Eastern languages. His first attempt was unsuccessful, but finally passing in through the medium of a supplemental examination, he took up Arabic and Turkish. These studies, however, proved uncongenial to his versatile nature, and failing to distinguish himself in them, he turned his attention in 1845 to the school of law. Here he met with equal discouragement. The professors—all Germans, and many of them not knowing enough Russian to make themselves understood—were favourite butts for the students' wit. There was practically no serious teaching, nor any personal interest shown in the pupils. Tolstoy's evil genius had once more cast him in stony places and left him to work out his own salvation. History, religion and law now claimed his attention in his final efforts to gain the university diploma. In religion his opinions had undergone a great change. From the child's unthinking acquiescence in a hereditary faith had sprung absolute unbelief. History he held a useless form of knowledge. "Of what avail," he said, "to know what happened a thousand years ago?" Hence he neglected the lectures on these subjects, absented himself from the examinations, was confined in the university gaol for irregular attendance, and ended by coming out but moderately well in the yearly examination. The conviction that he was wasting his time forced itself upon him. An idle, dissipated life had told upon his health, and early in 1847 Tolstoy asked permission to go down, "on account of ill health and private reasons." Thus ended his college life, which from an educational point of view he had treated as a jest. Somewhat of an enigma as he was to his companions, with his alternate fits of feverish gaiety and melancholy abstraction, aristocratic hauteur and liberal views, there was yet found a little band of students to accompany him on the first stage of his journey homewards. While probably admiring the original bent of his mind, they little dreamed their late comrade would one day be acclaimed as Russia's greatest thinker and novelist.

The Youthful Reformer.

Tolstoy went back to his estates with fresh hope and energy, determined to ameliorate the condition of his peasantry and fulfil the duties of a landlord. Rumours had reached him at Kazan from time to time of the recurring famines, revolts and miseries of the serfs. In 1847, as often before, the crops failed to suffice for the needs of the starving people, and whole districts set forth to petition the tsar for food. Here was a vital problem requiring prompt solution. In the course of desultory reading at the university he had studied the writings of Jean Jacques Rousseau, and the Frenchman's plea for Nature, honest work and simplicity of life, had impressed him greatly. Fired with enthusiasm, he now entered heart and soul on the task of realizing this ideal. Unfortunately, he was as yet without sufficient moral stamina to withstand recurring disappointments and to combat the suspicions of the serfs. The youthful reformer lacked the patience necessary to deal with the deep-rooted mistrust engendered by years of oppression and neglect. After six months of struggle with this discouraging state of things he temporarily gave up the attempt, and we find him in St Petersburg taking up for a time the broken threads of his education. But with the restlessness of transition strong upon him he soon returned to country life, and in company with his brother Sergius gave himself up to hunting, gambling, carousing with Zigani dancers, and throwing all serious thoughts to the winds. *The Landlord's Morning* may be taken as a picture of this stage of Tolstoy's life. The inevitable reaction soon came. Oppressed by debts and difficulties, in the spring of 1851 he betook himself to the Caucasus, where his eldest brother Nicholas was stationed with his regiment. At Pyatigorsk, at the foot of the mountains, he rented a cottage for about twelve shillings a month, and lived there with the utmost frugality.

Enters the Army.

Finally his brother's persuasions, aided by the influence of relations in high places, led him to enter the army. He passed the necessary examination at Tiflis, and joined the artillery in the autumn of the year. At that time Russia was much disturbed by the lawlessness of the Caucasian races. Bands of Circassians were constantly on the move, plundering and looting. The punitive expeditions in which Tolstoy took part were his first taste of warfare. Neither his military duties nor his love of sport entirely absorbed him, however. The great power which had hitherto lain dormant now awoke. He began to write, and within the next few years produced some of his finest works. Nekrassov, the editor of the Russian *Contemporary*, accepted *Childhood*, the young author's maiden effort. In accordance with the common practice, he received nothing for the MSS. Publication of a first attempt was considered ample payment in those days. Tolstoy was now twenty-four years of age. *Childhood* was followed by *The Landlord's Morning*, *Boyhood* and *Youth*, in quick succession. His early aspirations were revived in these pages, which reflect the doctrines of Rousseau. "You neither know what happiness is nor what life is," he writes to expostulating friends. "Once taste life in all its natural beauty, happiness will consist in being with Nature, seeing her, communing with her." His philosophy notwithstanding, Tolstoy felt a pardonable desire for promotion, which was slow in coming to him. Some verses ascribed to him (an authorship never denied) making fun of the general during the siege of Sebastopol, which appeared in print, may possibly have had something to answer for. Be that as it may, the spirit of unrest and dissatisfaction was moving Tolstoy to return home, when rumours of hostilities arose, and the Crimean War burst into flame. He promptly volunteered for active service, and asked to be allowed to join the army on the Danube, under the command of Prince Gortchakov.

The Crimea.

In the early part of 1854 we find him encamped before the walls of Silistria, a town of Bulgaria, which Gortchakov had invested. At the very height of the bombardment, however, Austrian intervention prevailed, and the siege was raised. The din of battle was hushed and revelry took its place. At the ball which promptly celebrated the event Tolstoy felt ill at ease. The joyous music and babel of tongues jarred on his sensitive ear, fresh from the moans of the wounded and dying. He went up to the prince and asked leave to start for Sebastopol. Permission being granted, he hastened from the ballroom, and left Silistria without delay.

He now exchanged the offensive for the defensive. Shot and shell fell like hailstones on the bastions of Sebastopol. Courage, fortitude, presence of mind were at every moment demanded, while assault followed assault, until at last the overwhelming strength of the allies compelled the Russians to retreat. Throughout that trying time Tolstoy cheered his companions, whiling away many a weary hour with jest and story. Amid this "wrackful siege of battering days" he wrote those *Tales from Sebastopol* which earned him instant literary celebrity, and caused the emperor Nicholas to issue special orders that he should be removed from a post of danger. An official despatch recounting the events of the siege was next written by Tolstoy at the command of his superior officer, and with the charge of this document he was shortly afterwards sent to St Petersburg. He was never again on the field of battle.

At St Petersburg.

Tolstoy returned home with new impressions. Sad at heart and sick of the horrors of war, he came back with a feeling of brotherly love for the common soldiers, whom he had seen day by day doing quiet deeds of courage and devotion, fighting for their country without hope of reward, without fear of death. He contrasted them with the more self-seeking nobles, and felt their superiority. The stirring scenes through which he had passed, the simple faith of his men, all had helped to renew his belief in God. Preceded by the fame of his descriptions of Sebastopol and the Caucasus, he arrived in St Petersburg to find himself the object of a general ovation. The *Sovremennik* (*Contemporary*), in which Tolstoy's first work, *Childhood*, had appeared, numbered among its contributors the foremost writers of the day. To be admitted to their ranks was considered by them an honour equivalent to the award of a *fauteuil* in the French Academy. They welcomed Tolstoy with open arms, the veteran novelist, Turgeniev, in particular hastening to greet him on his arrival, and begging him to make his house his home. Society was equally eager to open its doors to the young soldier-author. His vivid and dramatic pictures of the war had been widely read and had created a profound sensation. The great official world of St Petersburg proceeded to offer him a brilliant series of entertainments in which he found himself the central figure. It is not surprising that this combined adulation from literary men and society overcame for a time the growing asceticism of his character. Yet it also in a measure hastened its development. Even while borne swiftly on the current of pleasure, his strenuous nature gradually reasserted itself. In the pages of *My Confession* Tolstoy describes the phases of this mental unrest. The narrowness of a literary clique soon became irksome to his dominant character. His passionate desire for truth brought him into frequent conflict with those who paid more regard to convention. With Turgeniev especially he found himself constantly at variance. A friendship between natures so diametrically opposite, between two men who might be described as leaders respectively of the old and the new school of thought, could not long subsist. Mutual admiration does not imply sympathy. Turgeniev presently wrote to a friend, "I regret I cannot draw nearer to Tolstoy, our views are so opposed, the one to the other." And these differences of opinion gradually led to a complete estrangement. On the other hand, in Fet, the poet, he found a lifelong friend. Others of his intimates were Nekrassov, the editor of the *Contemporary*, already mentioned; Katkov, the celebrated journalist; Droushinine, Grigorovitch, Fet, and Ostrovski, the dramatist.

Russian Popular Movement.

While Tolstoy was thus waking to a sense of distaste for his environment, a great event was pending. With the accession of Alexander II. in 1855 a wave of progressive policy—set in motion by the tsar himself—stirred the bureaucratic circles of Russia, and while fiercely resisted by some of the nobility, met generally with cordial encouragement. The emancipation of the serfs became the burning question. "The People!" and "Progress!" were the cries quickly caught up by the press of Russia and of Germany also. It was in Germany, indeed, that the novel of humble life sprang into being, Gotthelf leading the way with his tales, *Uli the Serf* and *Uli the Tenant*. Auerbach followed with his village stories, which opened a new world of thought; Stifter and a host of others brought up the rear. This new impulse in literature soon spread to Russia. Turgeniev in his *Sportsman's Tales*, Grigorovitch in *The Village* and *Anton Goremika*, showed their sympathy with the moujik. But above all others, Tolstoy was most deeply and lastingly affected. Awakened by this echo from without of his own inmost yearnings, he realized at last the true bent of his mind. "The People" became his watchword. One increasing purpose henceforth ruled his life, and gradually brought into harmony the inequalities and contradictions of his character. Roused from the inertia which had been caused by nerves and hypochondria, he wrote *Polikoushka*, a painful story dealing with the ills of serfdom. His active brain then turned to considering the meaning and scope of the catchword "Progress," and fully to do this he determined to go abroad and study the educational and municipal systems of other countries. He finally started for Germany in January 1857.

Foreign Travel.

Tolstoy only three times crossed the Russian frontier, and these journeys were all between 1857 and 1861. On his first trip, Germany and Italy were hurriedly visited. He also made a short stay in Paris, which had attractions for him in the society of several Russian friends, among whom were Nekrassov and Turgeniev. With the latter he had not yet come to open rupture. From Paris he went to Lucerne. An incident which occurred there, and is reproduced in his semi-autobiographical *Lucerne*, shows the workings of his spirit. He tells how a wandering musician stood one day in the hotel courtyard, and after his performance asked in vain for alms from the convivial crowd assembled. Tolstoy, in the person of the hero, then indignantly came to the rescue, brought the poor minstrel into the hotel, and, moved to wrath with the churlish waiters who were unwilling to serve him, ordered a private room where he himself supplied his guest's wants, and sent him away happy with a double lining to his pockets. Of his successive journeys westwards, the third alone was of long duration and of corresponding importance in its results. Prior to this last visit to foreign parts, his time was spent between Yasnaya Polyana and Moscow, often in the company of his friend Fet. On a bear-hunt together, Tolstoy narrowly escaped death, an incident which he graphically describes in his *Fourth Reading-book for Children* (20th ed., 1900, &c.). Fet also mentions it in his *Reminiscences*. His departure was finally hastened by the serious illness of his brother Nicholas, who had gone to France to recruit his failing health. Tolstoy, after halting in Berlin and Dresden, joined him, but only to endure the grief of witnessing his end. Nicholas died on the 20th of September 1860, and Tolstoy's letters of that period show how deeply he was affected by the death of his brother. It gave a yet more serious turn to his thoughts. In a letter to Fet he reverts to his old trouble, the enigma of life. "In truth," he writes, "the position in which we stand is terrible." This mental gloom probably still hung over him during his wanderings through Italy. There is no record of his impressions of Rome, Naples, Florence. Turning his footsteps northwards, however, he began to take renewed interest in social conditions, elementary and monastic education, and the general subject of his quest. From Paris (where his friend spoke of him as "singular indeed, but subdued and kindly") he went to London in 1861, no noteworthy incident marking his brief visit.

Educational Experiments.

The spring of 1861 found him once more at Yasnaya Polyana, where some little time before he had forestalled the Emancipation Act by freeing all the serfs on that estate. He now began digesting the mass of information he had acquired abroad, eager to put his ideas into practice. The feelings with which he reviewed his experiences were largely those of disappointment. Of the educational systems of Italy, France and Germany, that of the last-named country alone earned his partial approval. While there he visited the universities, prisons and working-men's clubs. He made the acquaintance of Auerbach, and was greatly influenced by his ideas on village schools. He was also much impressed by the novel institution of the kindergarten, to which Fröbel, the great educationist, was devoting all his energies. Determined to follow these lines, he sought and obtained permission to open a school. In his zeal he also started an educational journal called *Yasnaya Polyana*. This journal now only exists as a literary curiosity, but the essays published in it have all been reprinted in his collected works. The time for opening the school was well chosen. The liberal spirits of Russia had gained the day and won a great victory. Just two months previously the decree of emancipation (February 1861) had been sent forth. The air was rife with schemes for the betterment of the peasantry. A new era seemed to have begun. Tolstoy's school was essentially "free." "Everything that savours of compulsion is harmful," he said, "and proves either that the method is indifferent or the teaching bad." So that not only were no fees paid, but the children came and went as they pleased, learned what they pleased, and were subjected to no sort of punishment. It was the duty of the teacher to fix the pupils' attention, and his the blame if they failed to learn. "The student," said Tolstoy "must have the right to refuse those forms of education which do not satisfy his instincts. Freedom is the only criterion. We of the older generation do not and cannot know what is necessary for the younger." On these principles the Yasnaya Polyana school was started in a house near that of Tolstoy. He himself taught drawing, singing and Bible history. The Old Testament was his handbook; he held it as indispensable in any course of instruction, a model for all books. Doubts and fears sometimes assailed him, still for a year all went well. Other schools were opened on the same lines in the district, and success seemed assured. But the eyes of the government inspectors had long been suspiciously fixed on them, and a correspondence on the subject presently ensued between the ministry of education and the home department. The verdict passed by the former was free from overt animus. "The activity of Count Tolstoy deserves respect and should win co-operation from the educational department, although it cannot agree with all his ideas; ideas which he will in all probability abandon on due consideration" (October 1862). Yet there was a subtle threat conveyed in these last words which was probably not without effect. Signs of discouragement grew visible. We find the enthusiast complaining that his masters desert him, his pupils fall away. The plague of inquisitive visitors annoys him. At the end of the second year the schools were closed, the journal discontinued, and Tolstoy, disheartened and sick, "more," as he writes, "in mind than body," betook himself to the healthful quiet of the steppes, to breathe fresh air, to drink *koumiss* and to vegetate. This was the end of his educational experiment, the aim of which was rather to develop the character than to educate in the ordinary sense of the term. When later he asked leave from the authorities to reopen the schools, it was peremptorily refused.

His socialistic theories were now fully unfolded. In his view the people were everything, the higher classes nothing. The latter had misinterpreted the meaning of "progress," imagining it to be synonymous with education; and hence compulsory teaching had been resorted to, with harmful results. Reading and writing played but a small part in forming a man's mind and fitting him for life. They merely rendered him more articulate. These questions should be left to the people themselves. Their demands were very clearly expressed. They knew what they wanted, and were thoroughly convinced that "in the great question of their spiritual development they would neither take a wrong step nor accept that which was false." Such was in substance Tolstoy's doctrine. "The people," he affirms, "are stronger, more independent, more just, more human, and, above all, more necessary than the upper class. It is not they who should come to our schools; we should learn of them." This desire to subvert society is akin to the philosophy of Rousseau, as expressed in *Émile* (livre iv.):—

"C'est le peuple qui compose le genre humain; ce qui n'est pas peuple est si peu de chose, que ce n'est pas la peine de le compter. L'homme est le même dans tous les états; si cela est, les états les plus nombreux méritent le plus de respect. Devant celui qui pense, toutes les distinctions civiles disparaissent: il voit les mêmes passions, les mêmes sentiments dans le goujat et dans l'homme illustre; il n'y discerne que leur langage, qu'un coloris plus ou moins apprêté. . . . Étudiez les gens de cet ordre, vous verrez que, sous un autre langage, ils ont autant d'esprit et plus de bon sens que vous. Respectez donc votre espèce; songez qu'elle est composée essentiellement de la collection des peuples; que quand tous les rois et tous les philosophes en seraient ôtés, il n'y paraîtrait guère, et que les choses n'en iraient pas plus mal."

While Tolstoy's theories were thus in course of practical solution, his literary powers suffered eclipse. Turgeniev, who lived near him in the country, writes in disgust that he "has grown a long beard, leaves his hair to fall in curls over his ears, holds newspapers in detestation, and has no soul for anything but his property." Indeed, his time was fully taken up, for while still occupied in supporting the school, he had allowed himself to be nominated to the position of "Arbitrator," which he held for a year and some months (1861–1862). This was an arduous post. The arbitrators were appointed under the Law of Emancipation to supervise the distribution of land, to adjust the taxes, define the conditions of purchase, and decide all matters in this connexion. These duties were after his own heart, and he went to work with a will. Every day he had difficult points to deal with, deputations of peasants coming to see him, the new law and the rights it bestowed on them having to be explained. The hardest of all Tolstoy's tasks was to remove the suspicion and mistrust felt by the serf towards the landlord. On the other hand, he had to contend with the nobility of the district, who were well aware of the side on which his sympathies placed him. For a year and a half he tried energetically to do his duty, but this experience led him eventually to regard the Emancipation Law as a not unmixed blessing. It had come too soon, and been granted unasked. The condition of the peasantry was worse than before. A noble impulse, inspired by love of the people, impelled Tolstoy to become their champion and interpreter.

Relations with the Peasantry.

A tragic incident occurring about this period (1866) forcibly illustrates Tolstoy's character as a defender of the helpless. A regiment had recently been stationed near Yasnaya Polyana, in consequence of some five hundred convicts being at work upon the railway. In this regiment was a certain Captain N., a strict disciplinarian, who led a solitary life and was much disliked by his brother officers and his men. For trifling faults he would condemn his soldiers to unheard-of punishments. One of his orderlies in particular, a young man of some education —who had voluntarily taken the place of a comrade to free him from military service—was constantly getting into trouble, until, for some slight clerical error in a report, Captain N. ordered him to be degraded and flogged. This was too much for the poor volunteer. He followed the officer as he was leaving the orderly-room, and struck him a blow on the face. He was immediately placed under arrest, and the details of the occurrence quickly spread through the neighbouring villages. Two officers of the regiment brought the story to Tolstoy and begged him to undertake the soldier's defence. He consented readily, and no opposition being made by the military authorities, at once prepared for the court-martial. A few days afterwards the court assembled. Warned by the president of the severity of military law, Tolstoy made answer that he was come to defend not a criminal but a man compelled to crime by force of circumstances outside his will. The plea he set up was that the prisoner was not in full possession of his senses; but this defence was not allowed to stand. The soldier was condemned to be shot, in spite of the utmost intercession Tolstoy could make. The emotion of the crowded assembly stirred by his appeal, the mute quiescence of the soldier (persuaded that death was better than the living agony of exile), the closing tragedy—all this, added to the many scenes of war and bloodshed which he had previously witnessed, made a lasting impression and caused him to raise his voice yet louder in the cause of universal love and peace. During the preceding period of ethical experiment he published only two books, but these stand high among his works. They were *Three Deaths* (1859) and *The Cossacks* (1863)—the latter written ten years before, its leading idea being that culture is the enemy of happiness. At the conclusion of his arbitratorship, seeing his efforts partially nullified, and feeling himself overstrained and overworked, he determined to exile himself for a time to Samara, a south-eastern province. He halted on his way in Moscow, and here one night's high play cost him the MSS. of *The Cossacks*, which he sold to the editor of the *Russian Messenger* for £100 to pay his debts of honour. A pleasanter feature of this visit to Moscow lay in the renewal of his intimacy with the Behrs family, Sophia, the younger daughter of the house, being his special attraction. He finally reached Samara in the spring of 1862, and went through a "koumiss cure," revelling in what he called "the life of a beast of the field."

By the month of July he felt completely restored to health, and returned to Yasnaya Polyana, where his sister Maria and his aunt, Mme Ergolskaya, were looking after the property. The house in which he now lived was comparatively new. The one in which he was born was sold to pay some earlier gambling debts, and had been removed bodily to the Dolgoe estate some 30 m. distant. He now felt a sense of something wanting in his home—a feeling of incompleteness took possession of him. He wanted to see Sophia Behrs, and accordingly left almost immediately for Moscow. Sophia's father was a fashionable Russian doctor, born and bred in Moscow, and a graduate of that university. He had three daughters, of whom Sophia was the second. The friendship between the Behrs and the Tolstoy families was of old standing, Countess Maria Tolstoy having been a school companion of Mrs Behrs. It was now the height of summer, and every one of consequence was leaving the city for their country seats. The Behrs family were going on a visit to their grandfather, whose estate lay not more than 40 m. from Yasnaya Polyana. Here they accordingly broke their journey, and during the pleasant days that followed Tolstoy's attachment deepened. Not long after their departure his impulse took shape, and mounting his horse, he set out for Twicy, where they were staying. His errand was a definite one; and he lost no time in fulfilling it. At first

Marriage.

Dr Behrs demurred, unwilling to allow his second daughter to marry before her elder sister, but his objections were presently overruled. On the 23rd of September 1862 the marriage took place, and Tolstoy installed his bride at Yasnaya Polyana with the conviction that calm and contentment were his at last. Two weeks later he wrote to his friend Fet, saying that he was now happy and felt quite a new man. In his *Confession* some years later he writes: "The new conditions of a happy family circle led me away from my researches into the meaning of life. My whole mind became concentrated on the family—on the mother, the children, and the anxiety to provide due means of subsistence. The effort after perfection resolved itself into the effort to ensure the happiness of my offspring." Tolstoy thereupon settled down to country life, and though to the young countess this exile from her town friends and relations must have been somewhat of a trial, they remained on their estates for the following eighteen years, with very short intervals of absence. They had thirteen children, of whom the eldest was born in June 1863. In the bringing up and instruction of his family Tolstoy conformed in essentials to the requirements of his position. No experiments were attempted. English and German governesses were engaged, and their educational methods followed the usual routine. Both father and mother devoted a considerable amount of time to their children. Punishment was rare. It consisted in a strict "boycott" of the offender, which was not relaxed until a frank confession of fault was made—no light penalty to a sensitive child. The theory of free option in study was dropped by Tolstoy in the case of his children, but he was for ever joining in their games, taking them on his shooting expeditions and sharing in their gymnastic exercises. Manual labour was always congenial to the great writer, and formed a natural concomitant to his pastoral existence. It was a common thing for him to mow the lawns, hoe and rake the garden beds, or when out walking to take the scythe from a labourer and wield it lustily.

Literary Work.

War and Peace and *Anna Karenina*, Tolstoy's two most widely known and finest novels, date their commencement from this period. These two novels were received with scant favour by both the Liberals and Conservatives in Russia. Katkov, the editor who was publishing *Anna Karenina* in his periodical, introduced so many changes into the MSS. that the publication was not continued. It was due to N. Strachov, the literary critic, that public opinion was brought to recognize the merits of these novels. Every day Tolstoy retired to his room for a certain number of hours, and whether in the humour or not, sat at his table and wrote. "Inspiration comes with writing," he used to say. Authorship he avowedly despised, yet confessed the temptation of public applause and heavy gains was too great to resist. The reading world has reason to be glad of this touch of inconsistency. Despite his genius for characterization, the task of novel-writing cost him a severe and determined effort. The technique of literary composition irked him exceedingly. "You cannot conceive," he writes in 1864 to his friend Fet, "how hard is this preliminary labour of ploughing the field in which I am compelled to sow. To consider and reconsider all that may happen to all the characters beforehand, and to think over the million of possible combinations, and to choose one out of a hundred thousand, is very difficult."

In the course of this correspondence interesting sidelights are thrown on Tolstoy as landowner and farmer. Not long after his marriage he wrote, "I have made an important discovery, of which I hasten to tell you. Agents, stewards and overseers are only so many hindrances to farming! Dismiss them all and lie abed till 10 o'clock, and you will see things will certainly go none the worse. I have made the experiment, and am quite satisfied. Now to business. When you are in Orel buy me 20 poods of various kinds of string, &c., and send them to me if it does not cost more than two roubles thirty kopecks a pood with the carriage"; and in this vein he enters into manifold rural matters, the progress of crops, the illness of a favourite horse or the calving of a valuable cow. Again the philosopher rises to the surface, and he questions Fet as to the workings of his mind.

"I don't mean in the Zemstvo nor in agriculture; these are occupations for active men, with which we employ ourselves in a perfunctory fashion, much like ants engaged in hollowing out a clod of earth—work of which the result is neither good nor bad. But what are you doing with your thoughts; how is the inner mechanism working? Is the secret spring trying to show itself, making its presence felt? Has it forgotten how to work? that is the all-important question."

At another time he pays a well-earned tribute to his wife's helpful sympathy. "She is by no means a trifler," he writes, "but is an earnest helpmeet to me." In literary matters he valued above everything the opinions of Fet and of Turgeniev (notwithstanding his saying of the latter, "the older I grow the less I love him"). Fet, indeed, was an intimate and devoted friend, constantly interchanging visits with the Tolstoy family. To him the scenes of *War and Peace* were first unfolded as Tolstoy read them aloud in the quiet evenings.

Quarrel with Turgeniev.

It was at Fet's house (in 1864) that the violent quarrel took place between Turgeniev and Tolstoy which nearly culminated in a duel. Many inaccurate accounts of it have been given, but the history of the rupture as recorded by Fet may be looked on as trustworthy. It seems that Turgeniev in rather a boasting spirit was praising his daughter's English governess—how she had desired him to name the precise sum his daughter might spend in charity, and how, at her instigation, the young lady made a practice of mending the clothes of some of the poorest peasants. Tolstoy, who was always against the artificial "philanthropy" of the wealthy, said brusquely that he thought it was theatrical and *poseuse* for a daintily-dressed girl to sit sewing at filthy, evil-smelling garments in the name of charity. Turgeniev thereupon rose, furious, from the table. "Stop saying such things!" he cried, "or I will force you to silence, with insults if need be." Peace was with difficulty restored by M and Mme Fet. The letters which subsequently passed between them only served to fan the flame, so that even the amiable Fet was involved in the dispute and for a short time estranged from Tolstoy. Finally, after a lengthy and acrimonious correspondence, the threatened resort to arms was averted through the interposition of friends; but fourteen years were allowed to pass before a reconciliation took place. In 1878 Tolstoy, believing himself to be in a dying state, at length made overtures of peace to his brother author; overtures which Turgeniev met cordially in the following terms:—

"Dear Leo Nikolaevitch,—I received your letter to-day which you sent to me *poste restante*. I was delighted and much moved by it. With the greatest pleasure I am ready to renew our former friendship and to press your proffered hand. You are quite right in thinking I harbour no feelings of enmity towards you. If they ever did exist they have long since disappeared, and no remembrance of you now remains save that of a man to whom I am sincerely devoted, and of a writer whose first step it was my great privilege to be one of the earliest to welcome; whose every new work has always aroused in me the greatest interest. I rejoice from my heart that our misunderstanding has come to an end. I hope to be in the province of Orel this summer, and then we shall meet. I send you my best wishes, and once more grasp your hand in friendship."

Meanwhile Tolstoy had pursued literary labours with relentless ardour and with ever-increasing fame. Prince André (the hero of *War and Peace*) and *Anna Karenina* in turn occupied all his thoughts. Several years were given to the perfecting of these remarkable character-paintings. When the publication (1864–1869) of *War and Peace* had been succeeded by that of *Anna Karenina*, he set himself to write yet another great novel, dealing with the times of Peter the Great, but after working at it for some months he suddenly abandoned the scheme. One of the few excursions made during these years of tranquillity was undertaken in 1866 to the battlefield of Borodino, the scene of the famous fight in 1812. For two days Tolstoy wandered over the plain, investigating and taking notes, and there he drew a plan of the battle, which was afterwards published as a frontispiece to *War and Peace*. But the continued pressure of severe nervous and mental strain was bound to affect a man of his calibre; health and spirits gradually sank, so that in 1870 Countess Tolstoy induced him once more to seek the healthful air of Samara, and subject himself to the "koumiss cure" in practice there. A strange feature of this "treatment" lay in the avoidance of meal and vegetables, the diet being strictly confined to meat. Tolstoy pitched his tent in the village of Karalieck, where the primitive life among the Bashkir nomads exactly suited his habits and disposition. He had a faculty for making himself at home with peasant folk, and was a great favourite among them. In this district there was a large community of Molochans, a sect whose tenets differ considerably from those of the Orthodox religion of Russia. They acknowledge no guide save the Bible, and reject all the rites and ceremonies of the Greek Church. Their honesty, industry and temperance made them an example to all the country round, and caused Tolstoy to study them with special interest. So delighted was the count with this visit to Samara, that he shortly afterwards purchased an estate of over 2000 acres in the district. But his pleasure was short-lived, for not long afterwards (1872–1873) the crops failed and a serious famine broke out. He thereupon opened a subscription fund for the starving population, and went from village to village taking a quantity of grain with him, and making what provision was possible in the circumstances.

At Samara.

Tolstoy was now making up for lost time, learning what he had failed to learn at the university. Greek was his great attraction. "Without Greek," he exclaims, "there is no culture." He also became enamoured of the writings of Schopenhauer, and for the greater part of a year (1869) devoted himself to the study of that philosopher. "Never," he says, "have I experienced such spiritual joys." Enthusiastic in everything he takes up, he assures his friends that Schopenhauer is the greatest genius he has met with. He sets himself to translate his works, and tries to enrol Fet as a co-translator. Philosophy at this stage of his life went hand in hand with sport and agricultural interests. He contemplated buying an estate in the province of Penza, but on the 21st of October 1869 he writes:—

Studies in Philosophy.

"The purchase of the estate in Penza has not come to anything. I have now finished the sixth volume (*War and Peace*), and I hope it will be published on the 1st of November. There are a lot of snipe. I have shot four brace, and to-day found two brace and killed one bird."

After a period of comparative rest and ease, the shadows of war and death once more encompassed Tolstoy. Two of his children died in 1873, and their loss was followed by that of his much-loved aunt, Mme Ergolskaya. A mental restlessness and uneasiness came over Tolstoy, and also a desire for the exercise of a wider philanthropy. The Russo-Turkish War put the crowning touch to these feelings. God and death, war and the intricacies of life were now the constant subjects of his letters. "You will not believe what joy your last letter has given me," he writes in 1877 to his dear friend Fet. "When you speak of the existence of the Deity, I agree with everything you say, and I would wish to write much, but time fails me and it is difficult in a letter. For the first time you write to me on the Divinity of God. I have been thinking about it for a long time. Don't say that we must not think about it. Not only we must, but we ought. In all ages the best people, the true people, have thought about it." Tolstoy now resumed the study of the Bible, and took special delight in the books of Ecclesiastes and Proverbs. He treats them as a new discovery, and recommends them to his friends as having much in common with the teaching of Schopenhauer! This revived interest in religious questions was accompanied and perhaps deepened by a state of extreme depression. It was then he reconciled himself with Turgeniev, and in December 1878 we find the latter staying with him on a visit of three days' duration. Turgeniev writes that he finds him "very silent, but much developed." The count on his side feels the same want of mutual sympathy as of old, and confesses that no real friendship seems possible between them.

Tolstoy now entered on the third phase of his life. He himself thus describes the stages of his mental growth. In the first phase he lived only for his own lusts and pleasures. This came to an end at the age of thirty-four. Then came the interest in the welfare of humanity, which married life cooled and obscured for a while. The striving for the welfare of mankind was mingled with the striving for personal well-being. But the third and highest phase was reached when the service of God became the motive power of his existence. All other aims grew subservient to this, and interest in the merely personal life had begun to disappear. He had passed through every imaginable grade of religious thought. As a child he had gone to church and confession unquestioningly. As a student and young man he had scorned and ridiculed religion. Later in life he became a pious and devoutly orthodox Greek Churchman, until one day during the Russo-Turkish War he was filled with a spirit of revolt at hearing the priests pray for the destruction of the enemy, beseeching the Almighty to help them to kill their hundreds and thousands. His whole being recoiled from the un-Christianity of these prayers, and he then and there renounced the orthodox faith. For three years he had exceeded the priests themselves in the regularity of his attendance. Now he felt there was something vitally amiss, and he flung it all to the winds. The novelist was rapidly being hidden in the philosopher's cloak, to the dismay of literary Europe. So early as 1859 Turgeniev had exclaimed, "If only Tolstoy would not philosophize, all might yet be well." His brilliant contemporaries, Gogol, Dostoievski and others, had all in different ways been seized in turn by what may be called the fever of religion. Tolstoy was to suffer from it too. Like the flickering of a dying lamp, his imagination again shone out in *The Death of Ivan Ilyitch* and *The Power of Darkness*. Subsequently, with rare exceptions, his writings were overloaded with ethical reasonings. He was now fifty. While leading a life outwardly calm and

Religious Development.

peaceful, he had passed through innumerable mental struggles and vicissitudes. Of these he speaks with simple candour in *My Confession*, an autobiographical sketch which appeared in print at intervals between the years 1879 and 1882. In the orthodoxy of the Greek Church, with fastings, prayers and rigid observances of her rites, he vainly sought an answer to his doubts; finally he broke away from a ceremonial which had become empty and lifeless to him, and built up a religion of his own. Impressed with the conviction that the peasant's mental ease was the result of his life of physical toil, Tolstoy tried to adopt the same habits, and for some ten years (dating from about 1880) he renounced the life of his own class as completely as it was possible for him to do. He rose early and went to work in the fields, ploughing, cutting the corn, working for the widow and orphan, and helping them to gather in the crops. He also learnt boot and shoe making, and enjoyed being praised for his skill. Thus he laboured late and early, and in these simple physical acts found the best cure for his attacks of despondency. "Simplicity! Simplicity! Simplicity!" His food and drink, his pleasures and personal indulgences, were curtailed. Meat was given up and replaced by a vegetarian diet. Field sports—equivalents for cruelty and lust of blood—were abandoned, and his gun hidden away to rot and rust. Even tobacco was renounced as luxurious and unhealthy.

But with all his straining towards simplicity, it was in the nature of things impossible for Tolstoy absolutely to lead the life of a peasant. Labour though he might throughout the day, there was his well-appointed house to return to. He could not cut himself off from his wife and children. Friends and acquaintances could not be wholly ignored by the would-be Diogenes. Circumstances in this respect were too strong for his views and wishes. The renunciation was still only a partial one. But as the strain of a great surrender is greatest while it is still incomplete, so Tolstoy felt more and more impelled to emancipate himself from worldly concerns. The break in the long spell of country life which presently occurred only served to deepen this desire. In 1881 his eldest son went to the university, and the two next in seniority soon followed him. It became necessary for the family to be in Moscow a great deal, for the sake of the children's education. The eldest daughter had come out into society, and friends were continually calling, obliging Tolstoy to sit and talk with them. All the elements of town life were distasteful to him. Money was an evil thing in his sight, and he gave up carrying it about with him, or even making use of it. "What makes a man good is having but few wants," he said, and he accordingly set himself to limit his wishes rigidly, and to detach his heart from all treasured objects. The year 1880 was the census year in Russia. The government, as usual, called for volunteers to help to carry it out. Tolstoy became one of the enumerators, whose duties afforded an excellent opportunity for seeing the conditions under which the poor lived. The misery of it made him often wish to surrender all his property and have nothing more to do with lands and money, but the government and family circumstances prevented him. In the pamphlet, *What are we to do?* he graphically narrates his census experiences. Again and again he attempted to carry his theories into effect. At last, calling his wife into his room, he explained to her that property and many possessions had become irksome to him. Wealth he now regarded as a sin. He wished to be rid of all personal ownership. In 1888 Tolstoy renounced all claim to his estates; everything was made over to his wife and children, the countess acting as trustee. True, this renunciation made little difference in his manner of life. He lived under the same roof as before, ate at the same table, wrote and read in the same study. The change was mental rather than material. He cared no longer for the growth or improvement of his estates, but gave himself up to ethical questions, and endeavoured day by day to bind himself more closely to the people. He now began to write specially for their benefit a number of simple tales which have been widely read, tales directed mostly against crying evils—the peasant's love of *vodka*, and like themes. He found willing fellow workers in the firm of Russian publishers known under the name of Posrednik (V. Tchertkoff, and a group of friends). *John the Fool*, which was published in 1886 in the "Posrednik Series," is generally considered the best of these stories. *The Power of Darkness* (1885) also appeared in this series, and was written with the same object in view. Unfortunately, the popularity of these stories aroused the attention of the government, and led to many of them being forbidden on account of their Socialistic tendencies.

Renunciation of Property.

The terrible famine of 1891–1892 added fresh lustre to Tolstoy's name. He and his family worked unceasingly in soup-kitchens and barns, distributing food and clothes. No true leader lacks a following. Every oppressed sect or individual turned instinctively to Tolstoy for sympathy and support, the most important case in point being that of the sect of the Doukhobors. Early in 1891 rumours began to reach headquarters of social and religious excitement fermenting among the inhabitants of the Caucasus, and especially among the Doukhobors (*q.v.*). This people, numbering from fifteen to sixteen thousand, shared their goods and property in common, and made laws of conduct for themselves, based on a simple form of religion unobscured by ceremonies or ritual. In these matters, and especially in refusing to serve as soldiers, they defied the governors of the Caucasian provinces, so that, as their numbers and strength of opposition to authority grew formidable, severe measures were put in practice for their suppression. Several of their leaders were exiled, and in 1895 some hundred of them were condemned to be enrolled for three years in the so-called "disciplinary regiment." It was in that year that Tolstoy came in contact with them personally, and became deeply interested in them. He promptly identified himself with the agitation in their favour, and by his endeavours aroused sympathy for them in other countries, especially in England. After many rebuffs from the government, and many unavailing efforts to reach the kindly ear of the Tsar, the persecution of the Doukhobors at length ceased, and they were allowed to emigrate. It was in aid of these people that Tolstoy wrote and published *Resurrection*. The attack on the Orthodox Church in this novel was probably the chief cause which led to his formal excommunication by decree dated the 22nd of February 1901. In later years Tolstoy maintained all his interests, but old age gradually told on his strength. He died on the 20th of November 1910 at Astapovo, where he was stricken with pneumonia when carrying out a sudden decision to leave Yasnaya Polyana and end his days in retirement.

The Doukhobors.

Death.

No account of Tolstoy can pretend to any measure of completeness which does not refer to his views on religion. Tolstoy himself attributes so much importance to them that he has written several books with the sole object of telling the world what he considers truth. In *My Confession* he describes the various stages of religious experience through which he has passed. He begins with a graphic picture of the religious state of the society in which he was brought up. There, although people were nominally orthodox, actually they believed in nothing. Indeed so inconsistent were the ideals of that society with any real belief in the Orthodox Church that at sixteen Tolstoy practically renounced Christianity and became a sceptic. During the whole of this period he felt unhappy and dissatisfied, for he had no theory which enabled him to solve the riddle of life. He found no solution to the question he often put to himself—Why do I live? nor to the other which depended on the first—How ought I to live?

Tolstoy's Religion.

It seemed to him that the men he met dealt with these questions in four ways. Some ignored them and treated life as if it were a meaningless jumble of vanity and evil. Others, recognizing the difficulty of satisfactorily solving these questions, simply shut their eyes and made the best of life as they understood it without thinking of the future. A third group answered these questions by regarding life as an evil and foolish thing and by putting an end to it. Fourthly, there were those who considered it a stupid and ridiculous farce and yet continued to live on, making the best of it.

Tolstoy himself took up the last position, although it failed to meet his spiritual needs. He felt that the millions who accepted the religious theory of life had somehow a better answer to the problem, notwithstanding that their solution was based on an absurd hypothesis. Although faith was unreasonable it alone gave meaning to life, faith being understood as the theory which linked man's finite life with the infinite. Having arrived at this conclusion Tolstoy was ready to accept any faith which did not require a direct denial of reason, and for this purpose studied Buddhism, Mahommedanism and Christianity. The only persons he felt who were happy and found a meaning in life were the poor, and the only life that could be lived in accordance with reason was life under simple conditions such as animals lived. Only man must labour, not as the animals, each for itself, but for all. The search after God was not an act of reason but of feeling. To live after God's word we must renounce all the material pleasures of life and be humble and charitable to all men. This belief he found in the churches, but mixed up with other things which he could not understand and which repelled him, viz. sacraments, fasts, bowing before relics and images. The church festivals, as commemorating miracles or alleged facts of Christ's life, were repugnant to him. Communion he explained to himself as an action done in remembrance of Christ and as signifying a cleansing from sin and an acceptance of Christ's teaching. When asked by the priest to repeat before receiving the elements that he believed that what he was about to receive were the real Body and Blood, he repeated the formula but found that no wish to believe could make him believe it. The attitude of the various Christian churches towards one another also alienated his sympathy; it had no resemblance to a union of love. He thought that there should be mutual concessions where beliefs had so much in common, but was told that any compromise involved an admission that the clergy had altered the primitive faith and that it was their duty to hand on the faith inviolate. He was also very much repelled by the attitude of the Church towards war and capital punishment. Tracing the happiness of the peasantry to their faith, he became convinced that there were certain elements of truth in Christianity. The Christian churches and the Greek Orthodox Church in particular had in his view combined to obscure the basis of truth in Christ's teaching.

Tolstoy therefore set himself to endeavour to eliminate what he thought the false doctrines and superstitious elements which had grown up round Christianity, and to discover the verities contained in it. Tolstoy started with the premise that Christ's teaching was communicated to unlettered persons and only put down in writing long after his death. "It may be assumed," he says, "that the Church in accepting the three synoptic gospels had accepted much that was inaccurate." Tolstoy argues that it should be remembered that the gospels must have gone through many changes and that he is therefore at liberty to deal with them critically. He sees in Christianity not an exclusively divine revelation, nor a mere historical phenomenon, but a teaching which gives meaning to life. The churches, he considered, were substituting a teaching which was not Christ's, but was a strained and contorted version of what Jesus taught. The sectarianism of Christianity had its root in the idea that the gospels are to be understood not by taking them by themselves, but by interpreting them in such a manner as to make them agree not only with the other sacred writings but with the traditions of the Church, which were themselves obscure. Tolstoy maintained that it was the foreign elements foisted upon Christ's teaching which have alienated the best minds from Christianity. Anyone taking Christ's teaching alone will see that it has no admixture of elements that contradict common sense. It has no sympathy with superstitions, contains no "dregs," has no "darknesses," but is the strictest and fullest system of ethics.

The substance of Christianity seems to Tolstoy the inculcation of love, humility, self-denial and the duty of returning good for evil, and these essential principles attracted him throughout his life, even when he was a sceptic. The Greek Orthodox Church treated these principles rather as accessory to the teaching of Jesus than of its essence, and the Church considered dogma of more importance. The rule of the Orthodox Church concerning dogmas, sacraments, fasts, prayers, seemed not only unnecessary but were not based on anything in Christ's teaching. The Sermon on the Mount as reported in Saint Matthew contains, according to Tolstoy, the essence of Christ's teaching which Christians should carry out entirely. The key to the sermon is contained in the words "Resist not evil," this injunction meaning that not only should Christians never repay evil with evil but also that they should not oppose it with physical force. Any physical resistance of evil is contrary to the law of love. This command he regards as the central point of the doctrine of Jesus and as really easy to obey, for which view he quotes Christ's statement, "My yoke is easy." The whole teaching of the churches was contrary to Christ's teaching when they gave their sanction and approval to armies and the enforcement of the criminal law by the executive powers of a government. Christian society not only ignored Christ's injunction not to resist evil but was actually based on a denial of its truth. The words "Judge not that ye be not judged" Tolstoy treats as an expansion or rather as a logical result of the command "Resist not evil." Jesus denied the possibility of human justice, demonstrating in the case of the woman taken in adultery that man could not judge his fellow man, since he himself was also guilty. Jesus' declaration amounted to saying, "You believe that your laws reform criminals; as a matter of fact they only make more criminals. There is only one way to suppress evil, that is to return good for evil without respect of persons." The whole social fabric of modern so-called "Christian" society was founded upon principles disapproved of by Christ. Its prison cells, factories and houses of infamy, its state church, its culture, science, art and civilization were all based on coercion and violence. People pretended that Christ did not abolish the Mosaic law, but that the law of Christ and the law of Moses harmonized. But Christians acted on the principle of "an eye for an eye," discarding the law of Christ and following that of Moses.

Tolstoy goes through the gospel for the purpose of finding out what Christ's teaching really is. In doing so, he puts aside the miraculous events of Christ's birth and all other miracles as irrelevant to his inquiry, and also impossible of belief. The result is that he finds that Christ laid down five "entirely new" commandments, the first commandment being "Live in peace with all men," which was the interpretation put upon the words "Ye have heard it ever said by the men of old time that thou shalt not kill and that whosoever shall kill shall be in danger of the judgment, but I say unto you whosoever is angry with his brother shall be in danger of the judgment." The words "without cause," Tolstoy rejects, as does also the Revised Version. He considers these words open the door to the evasion of the commandment. Tolstoy interprets the next words, "and whoever shall say to his brother 'raca' shall be in danger of the council, but whosoever shall say 'thou fool' shall be in danger of hell fire" to mean that one must never look upon a human being as worthless and as a fool. Not only must Christians refrain from anger, but it is the duty of a follower of Jesus to live in peace with all men. They should not regard anger as justifiable in any circumstances. The second commandment of Jesus Tolstoy declares to be, "Thou shalt not be united physically to any woman except the one whom thou hast originally known sexually. You commit a sin if you ever abandon that woman. Marriage is marriage, whether there have or have not been any legal or ecclesiastical formalities, once there has been physical union." The third commandment as Tolstoy understands it is "Swear not at all." This commandment applies not merely to profane swearing but to all kinds of oaths, whether taken by witnesses in courts of law, by soldiers when being sworn in, by magistrates in pursuance of their office, oaths of fidelity and the like. All the oaths are imposed for an evil purpose and are entirely wrong. The fourth commandment is "Resist not evil." Christ's followers were never meant to act as judges, citizens, policemen or in any other capacity in which it would be their duty to resist evil. Christians should do good in the sense of living virtuously. To abolish evil they should avoid the commission of evil, and never under any circumstances resist wrongs by force. They should never return violence by violence. Christ taught "If any one strike you, suffer it; if any one would deprive you of anything, yield it up to him; if any one would force you to work for him, go and work for him; if any one would take away your property, abandon it to him." The fifth commandment is laid down in Matt. v. 43–48. After calling the attention of his readers to the fact that the words which introduce the injunction to "Love your enemies," &c., read, "Ye have heard it said of old that thou shalt love thy neighbour, and hate thine enemy," Tolstoy points out that these words must be understood as meaning "Thou shalt love thy fellow countryman and hate the foreigner." But when Christ taught in opposition to this maxim "Love your enemies, bless them that curse you," He meant "You have heard it laid down of old that you must love those of your own race and hate foreigners, but I say to you, love every one without distinction of nationality." It is difficult to love your personal enemy, but it is perfectly possible to love citizens of a foreign nation equally with your own. Tolstoy admits that it is difficult to conceive that everything that is considered essential and natural—what is thought noble and grand—love of country, defence of one's own country, its glory, fighting against one's country's enemies—is not only an infraction of the law of Christ but directly denounced by Him. People might here retort "If it is true that Jesus really meant this He would have said so plainly." To this objection he replies "We must not forget that Jesus did not foresee that men having faith in His doctrine of humility, love and fraternity could ever with calmness and premeditation organize themselves for the murder of their brethren. Christ not foreseeing this did not in so many words forbid Christians to participate in war." To make good this point Tolstoy shows by quotations from the Fathers that none of the early Christians ever contemplated fighting with any thing but spiritual weapons.

The doctrines of original sin, of the Atonement, of the Trinity, of the Resurrection, are, according to Tolstoy, all without foundation and contrary to Christ's teaching. Man is conscious, he writes, of a spiritual essence which exists in an imperfect form not only within himself but also in all other living creatures. The perfect spiritual essence is what we call God. It is the indwelling of this spiritual essence in man which creates the desire for communion with God and with those who possess the spirit imperfectly. The true life of man consists in fulfilling the needs of the spirit; and everything that helps to free it from the influence of the body which is antagonistic, tends to encourage the growth of that immortal part. When death comes the spirit is emancipated from the body and returns to God, where possibly, says Tolstoy, it ceases to have an individual existence. The spirit in man is not subject to the limitations of time and space. The life of the individual, however, is essentially bounded by time and space. With the destruction of the body this life ceases to exist, but the divine spiritual life remains. Death is therefore not annihilation but merely the emancipation of the spirit, its introduction to a new and unknown state of existence, to another form of manifestation of the divine spiritual essence. The more a man endeavours to live the life of the spirit the nearer his approach to the eternal and the less the significance of death. But it is impossible for the human intellect to conceive any form of existence outside space and time. So far therefore as immortality implies a resurrection of the body Tolstoy denies it; so far as it implies an individual consciousness of the soul he states we can predicate nothing of it. There are two doctrines of life. One of these doctrines, the source of all error, consists in believing that the personal life of man is one of his essential attributes. The other doctrine, that taught by Jesus, is that the whole purpose of our personal life lies in the fulfilment of the will of God.

Before attempting to define the powers and position of an author, it is best to pass in review the works which have led to his present reputation. Tolstoy the writer is a guide of unusual faithfulness to Tolstoy the man. The gradual evolution of the reformer and preacher out of the brilliant novelist is described in no pages so clearly as in his own. *Childhood* (1852), *Boyhood* (1854) and *Youth* (1855–1857)—Tolstoy's first literary efforts—may be regarded as semi-autobiographical studies; if not in detail, at least in the wider sense that all his books contain pictures, more or less accurate, of himself and his own experiences. No plot runs through them; they simply analyse and describe with extraordinary minuteness the feelings of a nervous and morbid boy, a male Marie Bashkirtseff. They are tales rather of the development of the thoughts than of the life of a child, with a pale background of men and events. The distinct charm lies in the sincerity with which this development is represented. We are introduced by the child, Nicholas Irtenyev, to a number of characters one after the other—father, mother, grandmother, tutor, servants and serfs; and are led by him from the father's study to the morning-room, and so on to the kitchen and the housekeeper's closet; and we catch, as in a magic crystal, the lifelike scenes on his waking—in the schoolroom—at his mother's side. But the apparently unconscious change of the child's mind into that of the youth—his budding thoughts, hopes, fears—form the true drama of the story. The *Cossacks* (1863), written round the theory that culture is an enemy to happiness, was followed by *War and Peace* (1864–1869), which has been justly called a Russian epic. Within its pages Tolstoy has marshalled a panoramic array of kings, princes and nobles as they lived and moved during the times of the great Napoleonic wars. There are so many figures in the picture, so much kaleidoscope colour and movement, that the spectator often finds it difficult to follow the thread of the narrative. The leading characters principally belong to the highest Russian society, whose circle—with its inflexible code of laws and customs, and a vitiated moral atmosphere affecting each member of it in a greater or less degree—links them together. The interest centres not so much in any single person as in the groups formed by four leading families of the "grand monde"—the Rostovs, Bezouchovs, Volkonskys and the Kouragines—all bound together by common aims and interests. The men are eager to make a name and enjoy life; the women seek pleasure in gossip and romance. Peter Bezouchov and Prince André, with natures essentially different but united by a love of truth, are the exceptions to this rule. Peter Bezouchov is one of Tolstoy's finest characterizations, drawn with a masterly hand. He is the embodiment of all that is good and bad in the Russian temperament. On the one side there is the striving after an ideal and a capacity for self-sacrifice, on the other an absence of firmness and balance. Like Tolstoy himself, he is always in doubt as to what is right and what is wrong, as to the meaning of life and death, and, like Tolstoy at that time, can as yet find no answer to these riddles. While Peter Bezouchov is a typical Russian, a very Tolstoy, Prince André if a less striking, is a more lovable personality. Upright and noble-minded, he yet is unable to cast off the chains of custom which have held him from childhood. He too is constantly seeking mental rest and finding none. The love-story of André and Natasha Rostov, which runs through the novel, is a poem in itself. Natasha is almost the only heroine Tolstoy has given us who wins our affections; but even she, after many transitions, sinks to the level of the *Hausfrau*, with no aim beyond the propagation and nurture of the race. It must be borne in mind that in *War and Peace* Tolstoy winged his shafts not at men generally but at that particular section of society to which he himself by birth and association belonged.

Tolstoy as a Writer.

"War and Peace."

A long period of silence followed the publication of this novel, during which the world heard little of him. At length in 1873 he issued the first parts of *Anna Karenina*. It is without doubt his greatest literary production. The area of time and space in it, as in the preceding book, is large, but it has more continuity of action, and the principal characters are kept well in the foreground. It is a study of modern Russian life, in which the normal passivity of unsympathetic conjugal relations is sharply contrasted with the transient omnipotence of passion and deep love. The hero and heroine are Count Wronsky, a young soldier in a crack regiment, and Anna Karenina, the wife of an important official in the political world of St Petersburg. The parts of secondary heroine and hero are filled by Kitty Cherbatzky and her lover and ultimate husband, Levine. The central figure is of course Anna herself, an elegant and fascinating "mondaine." She is honest, frank and well endowed by nature, and has an innate striving after truth and beauty in art and in life, but her early marriage with Karenina (who is double her age, reserved and taciturn), while socially advantageous, has dulled and stunted her ideals. Ignorant of the meaning of love, she despises it, and it is not till she meets Wronsky that she realizes to the full the emptiness of her existence. Wronsky, young, handsome, impassioned, recognizing no principle but his own desires, offers her the rich wine of life at a draught. She tastes it, after scant hesitation; and then, flinging away her worldly position, deserting her husband and child, she drains it to the dregs, only to find that poison lies in the cup. Anna and Wronsky have no true ideal to cling to. He, as their passion cools, finds the tie irksome and a hindrance to his career. She grieves for her lost and dearly-loved son, and frets as she sees that Wronsky's devotion is waning, recognizing too late that he loved her chiefly for vanity's sake, that they are slipping daily asunder, and growing displeasing to each other. Her past life is closed to her, the future opens like an abyss. The crisis has come, and swiftly obeying the impulse of her despair she seizes on death as her only weapon for wounding Wronsky and cutting the hopeless knot of her life. This pitiful end is led up to step by step with microscopic truth and insight into the springs of human action. In the married life of Kitty and Levine, on the other hand, Tolstoy describes a state of happiness of a material nature—disagreements easily bridged over, and mutual interest in their children and the pleasures of the country. Levine is the Tolstoy of fiction. The improvement and development of his estates, the life of a country squire, fail to satisfy him. The death of his brother, the birth of his child, awaken his mind to the problems of existence, and he is plunged in melancholy. Finally, relief comes to him with the words of a peasant who bids him "live for his soul and for his God." Thereupon Levine exclaims, "I have discovered nothing. I have simply opened my eyes to what I knew already; I have come to the recognition of that power which formerly gave me life and which renews life in me to-day. I am freed from error; I recognize my master." And the novel ends with the effacing of the intellect in a cloud of happy mysticism.

"Anna Karenina."

The *Kreutzer Sonata*, published in 1890, created a profound impression. Many who were previously unacquainted with Tolstoy's work read this story of love, jealousy and revenge, and were dumbfounded by its boldness. It is a startling advance upon *Family Happiness*, published thirty years earlier. Society generally, and Russian society in particular, is ruthlessly condemned for its views on marriage and its attitude towards the vexed question of the relations between man and woman. Marriage, Tolstoy says, can only be condoned if spiritual sympathy exists, and then only as the means to the continuance of the race; otherwise it is a breach of true morality. The "motive" of the *Sonata* is that the ideal we should strive after is a life where the spiritual penetrates and pervades everything, and where all that is carnal is eliminated. But in the "Sequel" to the *Sonata* Tolstoy adds that great ideals are always unattainable, and affirms that no man can know, whilst yet striving, how nearly he approaches them. He is only conscious of his deviations.

"Kreutzer Sonata."

The views of culture forming the basis of *The Cossacks* are yet further elaborated in *What is Art?* (1898), a sweeping criticism of the philosophy of aesthetics, to which he had devoted fifteen years of thought. He dismisses as inadequate the theories which define art as the pursuit of beauty, whether beauty be regarded with Shelley and Hegel as an approximation to archetypal perfection, and thus allied to God and goodness, or with Kant as that which gives disinterested pleasure. Tolstoy sets forth his own view that art is a human activity which aims at the transmission of emotion. He proceeds to demand that the emotion shall be actually felt and shall belong to the highest feelings to which men can rise. True art must appeal to the religious perception of the brotherhood of man, and it must find universal response. He asserts that exclusive art is bad art, and that such subjects as sexual love, patriotism and religious devotion should be avoided. (C. H. W.)

"What is Art?"

TOLSTOY, PETR ANDREEVICH, Count (1645–1729), Russian statesman, was the son of the *okolmnichy* Andrei Vasilevich Tolstoy. He served in 1682 as chamberlain at the court of Theodore III. Miscalculating the strength of the tsarevna Sophia (*q.v.*) he became one of her most energetic supporters, but contrived to join the other, and winning, side just before the final catastrophe. For a long time Peter kept his latest recruit at arm's length; but when, in 1697, Tolstoy volunteered to go to Venice to learn Italian and ship-building, Peter could not resist the subtle flattery implied in such a proposal from a middle-aged Muscovite noble. In November 1701 Tolstoy was appointed the first regularly accredited Russian ambassador to the Porte, and more than justified the confidence of the most exacting of masters; though his peculiar expedients (*e.g.* the procuring of the strangulation of a grand vizier and the removal by poison of an inconvenient private secretary) savoured more of the Italian than of the Russian Renaissance. Even before Poltava, Tolstoy had the greatest difficulty in preventing the Turks from aiding the Swedes, and when Charles XII. took refuge on Turkish soil he instantly demanded his extradition. This was a diplomatic blunder, as it only irritated the already alarmed Turks; and on the 10th of October 1710 Tolstoy was thrown into the Seven Towers, a proceeding tantamount to a declaration of war against Russia. On his release from "this Turkish hell," in 1714, he returned to Russia, was created a senator, and closely associated himself with the omnipotent favourite, Menshikov. In 1717 his position during Peter's reign was secured once for all by his successful mission to Naples to bring back the unfortunate tsarevich Alexius, whom he may be said to have literally hunted to death. For this he earned the undying hatred of the majority of the Russian people; but Peter naturally regarded it as an inestimable service and loaded Tolstoy with honours and riches, appointing him, moreover, the head of the secret chancellery, or official torture chamber, a post for which Tolstoy was by nature eminently fitted. He materially assisted Menshikov to raise the empress consort to the throne on the decease of Peter (1725), and the new sovereign made him a count and one of the six members of the newly instituted supreme privy council. Tolstoy was well aware that the elevation of the grand duke Peter, son of the tsarevich Alexius, would put an end to his own career and endanger his whole family, so that when Menshikov, during the last days of Catherine I., declared in favour of Peter II., Tolstoy endeavoured to form a party of his own whose object it was to promote the accession of Catherine's second daughter, the tsarevna Elizabeth. But Menshikov was too strong and too quick for his ancient colleague. On the very day of the empress's death (May 11, 1727), Tolstoy, now in his eighty-second year, was banished to the Solovetsk monastery in the White Sea, where he died two years later. He is the author of a sketch of the impressions made upon him by western Europe during his tour in the years 1697–1698 and also of a detailed description of the Black Sea.

See N. A. Popov, "Count P. A. Tolstoy" (Russ.) in *Old and New Russia* (Petersburg, 1875); and "From the Life of P. A. Tolstoy" (Russ.) in *Russian Reporter* (Petersburg, 1860); R. N. Bain, *Pupils of Peter the Great* (London, 1897); and *The First Romanovs* (London, 1905). (R. N. B.)

TOLTECS (Mexican *Tolteca*), or dwellers in Tollan (the place of reeds), the name of a people that if partly mythical is also partly historical. Traces of this people can unquestionably be detected in historic times; and many cities, particularly those which carried on traffic with the coast, claimed to be of Toltec origin. The conception of Toltecs, like that of Chichimecs, acquired in time so general and vague a significance that in vocabularies such a word as "toltecatl" is interpreted as meaning merely an expert artist. So that in some cases the name "Toltecs" denotes no more than some race of Nahua affinities possessed of a certain degree of culture. In others, however, there is a substantial reason for believing in the existence of a specific tribe or people called Toltecs, though the genuine historical background has been obscured by the legends which the priests embroidered upon it to glorify their hero and god Quetzalcoatl.

Our ignorance as to the distribution and movements of the native peoples before the time of the Spanish invasion forbids any positive statement as to the original home of the Toltecs. It is certain, however, that they, as well as their god and their ancient city of Tollan, were known to those who lived in the Maya countries far beyond the confines of Mexico proper. Their migration-myths point to the eastern districts known as the "tierras calientes," famous for such valuable products as feathers and cacao, with which the Mexicans from the earliest times carried on a vigorous commerce. It is possible that the legendary wanderings of Quetzalcoatl (Feathered Serpent), who was said to have committed himself to the flames in Tlillan-Tlapallan (the land of the black and red, *i.e.* the land of picture-writing), the region of Tabasco and Campeche, are mainly a mythological description of the moon's periodic course. But even in that case there can be no doubt that the nature-myth has been embellished with details derived from an actual race movement which took place in prehistoric times.

The *Historia de Colhuacan y de Mexico* is a most valuable manuscript written by an anonymous author in the Mexican language. In this work it is stated that Quetzalcoatl died in A.D. 895, and was followed by four kings in succession, after whom the wise Huemac ascended the throne in A.D. 994 under the name of Atecpanecatl. In the reign of this sovereign there broke out a great famine, which occasioned the institution of the custom of human sacrifice. From the same source we learn that it was in A.D. 1064 (a date which is assigned to the beginning of a half-mythical history by various other documents and MSS.) that the Toltecs left their homes and migrated eastward to Tabasco and Soconusco. At the same time Huemac killed himself in the cave of Cincalco. Tradition ascribes to him the authorship of an encyclopaedic picture-writing called "teoamoxtli" dealing with the history of his people, with astronomy, the calendar system, &c. According to the *Historia de Colhuacan y de Mexico*, which is confirmed in spite of some slight variations of detail by Ixtlilxochitl, the duration of the "Toltec Empire" was not more than 318 years.

Archaeologists are justified in claiming as indubitable monuments of the Toltecs the serpent-pillars which have been found *in situ* at Tula, close to the City of Mexico. The historian Sahagun states that Tula was an old centre of the Toltecs and explicitly mentions these pillars as their work. It is interesting therefore to note that the only other place where such pillars occur is Chichenitza in Yucatan (see CENTRAL AMERICA: *Archaeology*), a site which exhibits most strikingly Mexican features, so that archaeology fully confirms the assertion of the historians that Chichenitza, though in Mayan territory, was subject to the domination of some Nahua people. Chichenitza and Mayapan are the only sites in Mayan territory at which are found those round temples, which are attributable exclusively to Quetzalcoatl, the principal god and national hero of the Toltecs. (W. L.*)

TOLUCA, or TOLOCCAN, a city of Mexico and capital of the state of Mexico, on the S.W. border of the Anahuac plateau, at the foot of the Cerro San Miguel de Tutucuitlalpillo, about 8650 ft. above sea-level. Pop. (1900), 25,940. Toluca is on the Mexican National railway, 36 m. W.S.W. of the national capital. Its situation near the high cordillera gives it a cold, changeable climate. The government has a meteorological station here and a national college. Industries include the manufacture of cotton fabric, flour and wax candles. Swine-breeding is a profitable occupation in the vicinity. The Nevado de Toluca, an extinct volcano, rises to a height of 14,950 ft. on the south-west side of the town. Its summit is frequently draped with snow, and its broken-down crater contains a lake. Traditionally Toluca was one of the earliest Toltec settlements on the Anahuac tableland, but no remains of this occupation have been preserved.

TOLUENE, or METHYLBENZENE, C_7H_8 or $C_6H_5 \cdot CH_3$, an aromatic hydrocarbon; the first homologue of benzene. Discovered by Pelletier (*Ann. chim. phys.*, 1838, 67, p. 269) in the oil obtained in the manufacture of gas from the resin of *Pinus maritima*, and named retinnaphte, it was prepared from the same gas by Couerbe (ibid., 69, p. 184) and named heptacarbure quadrihydrique, C_7H_4 ($C = 6$); Sainte-Claire Deville (ibid. 1841 [3] 3, p. 168) obtained it by distilling Tolu balsam, naming it benzoène, and Glénard and Bouldault obtained a substance by the dry distillation of dragon's blood which they called dracyl. The complete identity of these substances was established by A. W. Hofmann and Muspratt, and they adopted the name toluol (anglicized to toluene), which was proposed by Berzelius. Its derivatives and its relation to benzene had been previously studied by the above and other experimenters, its relation to benzene being first proved experimentally by Cannizzaro and its constitution settled by Fittig and Tollens's synthesis from sodium and a mixture of methyl iodide and brombenzene.

The hydrocarbon occurs in wood-tar and in petroleum, and is prepared commercially by fractional distillation of the light oil fraction of the coal-tar distillate (see COAL TAR). It may be obtained synthetically by Fittig and Tollens's method (above); by Friedel and Craft's process, devised in 1877, of acting with aluminium chloride on a mixture of benzene and methyl chloride; this reaction leads to the production of higher homologues which may, however, break down under the continued action of the aluminium chloride; or by heating the toluene carboxylic acids obtained by oxidizing the higher homologues of benzene. It forms a colourless mobile liquid, boiling at 110·3° C. and having a specific gravity of 0·8708 (13·1/4°). It is insoluble in water, but dissolves readily in alcohol and ether. On reduction it yields hexahydrotoluene; oxidation with dilute nitric acid or chromic acid gives benzoic acid; whilst chromyl chloride and water give benzaldehyde. On nitration it gives ortho- and para-nitrotoluenes—which on reduction yield the valuable toluidines, $C_6H_4(CH_3)(NH_2)$—and on sulphonation the parasulphonic acid is formed with a little of the ortho acid. Chlorination in the cold gives ortho- and para-chlortoluenes, but at the boiling point the side chain is substituted (see BENZALDEHYDE).

TOMAHAWK (a native American word, probably from the Algonquian verb *otomahuk*, to knock down), the war-hatchet of the North American Indians. The earliest tomahawks were of chipped stone, usually sharpened to a point at each end something like a pickaxe, and passed through a hole bored in a stout wooden cudgel. In the more primitive types the stone head was simply tied to the handle by animal sinews, or a withe was doubled over the head and fastened below to form a handgrip. Sometimes deer antlers were used instead of stones. After the arrival of the white man the heads were usually of iron. Where the stone head was sharpened only at one end the blunt end was sometimes cut out into a pipe-bowl, the handle, hollowed, serving as the stem. The weapon was at once symbolical of war and peace, and was ceremoniously buried at the termination of hostilities, to be as formally exhumed when the feuds revived. Hence the colloquialism "to bury the hatchet."

TOMASZÓW, or TOMASZÓW FABRYCZNY, an industrial town of Russian Poland, in the government of Piotrków, 41 m. N.E. of the town of Piotrków. Pop. (1897), 21,041. It has woollen mills, steam flour-mills and ironworks.

TOMATO, *Lycopersicum esculentum* (Nat. Ord. Solanaceae), a tender annual, native of South America, probably Peru. The fruit is much esteemed in salads and as a vegetable. Efforts have been made to popularize it for dessert, with varying success.

Plants intended to fruit out of doors during the summer should be raised from seed sown at the end of February or early in March, under glass, in a temperature of about 60°. Pots, pans or shallow boxes are suitable for the purpose. The compost should be light and fresh, preferably of loam, sand and leaf mould in equal proportions. As soon as the young plants appear they should be fully exposed to sunlight, as near the glass as practicable. When the second pair of leaves appear they should be potted singly in pots of about 3 in. diameter, using slightly richer compost and less sand. This operation should on no account be deferred. The next shift should be into pots 7–8 in. diameter, the compost mostly loam, enriched with the ashes of plants, &c., from the refuse heap. The first flowers will appear towards the end of April or early in May. The pollen should be gathered and applied to the stigmas of the flowers by hand. The plants should be fit for planting out early in June, and should bear at least two clusters of rapidly growing fruits. They should be planted in the sunniest and warmest position available. It is customary to confine the plants to one shoot, pinching off all lateral shoots as they appear. Owing to the fickleness of the English climate it is of the utmost importance that the setting of fruit should be secured early. Manure should be applied sparingly to tomatoes until the crops become heavy.

Under glass, without artificial heat, tomatoes succeed well. In cold, sunless seasons, however, the crops are seldom remunerative. The culture is substantially as advised for out of doors. In heated structures tomatoes may be produced all the year round. They are always a small and precarious crop during winter, however. During summer the crops are usually heavier and of better flavour, even in favourable seasons, than from out of doors. It is necessary to provide a succession of plants to replace those that are being worn out by heavy cropping. Periodical sowings are therefore necessary. Some prefer to raise the plants intended for winter fruiting by cuttings inserted in August. Planting out is usually effected on shallow benches in small quantities of moderately rich soil, and the shoots trained on wires near the glass. As more nourishment is required, new soil is added. In this way excessive luxuriance, to which the tomato is so addicted, is avoided. The plants should never be allowed to become dry—they are large consumers of water.

The following varieties comprise some of the best in cultivation:

Large Smooth Red Fruited.—The Hastings, Conference, Ham Green Favourite Perfection.

Yellow Fruited.—Chiswick Peach, Golden Jubilee, Carter's Greengage.

Early Varieties for Outdoor Culture.—Chemin, Frogmore Selected.

TOMB (Gr. τύμβα, τύμβος, probably allied to Lat. *tumulus*, literally a swelling, *tumere*, to swell), a general term for a place of burial for the dead, including the excavation or cavity in which the body is laid and the superstructure which marks the place. (See BURIAL and FUNERAL RITES.)

The various forms which the tomb has taken throughout the ages are treated under such heads as BARROW; CAIRN; TUMULUS; CENOTAPH; SARCOPHAGUS; &c.

TOMPA, MIHÁLY [MICHAEL] (1817–1868), Hungarian lyric poet, was born in 1817 at Rima-Szombat, in the county of Gömör, his father being village bootmaker. He studied law and theology in Sáros-Patak, and subsequently at Budapest; and, after many vicissitudes, at the age of thirty he accepted the post of Protestant minister in Beje, a small village in his native county, whence, in two years, he removed to Kelemér, and four years later to Hanva, in the county of Borsod, where he remained till his death in 1868.

At the age of four-and-twenty Tompa published his first poems in the *Athenaeum*, which soon procured for him a high reputation. His first volume, *Népregék és Népmondák* ("Folk-Legends and Folk-Tales"), in 1846, met with great success, and the same may be said of the first volume of his "Poems" in 1847. In 1848 he took part in the War of Independence, acting as field chaplain to the volunteers of his county and seeing several battles; but the unfortunate close of that heroic struggle silenced his poetic vein for a considerable time, and when in 1852 and 1853 he gave vent to his patriotic grief in some masterly allegories on the state of oppressed Hungary, he was twice arrested by the Austrian authorities. After being released he published his *Virágregék* ("Legends of Flowers"), a collection of poems showing great imagination and love of nature. Soon after this he became oppressed with melancholy and abandoned this branch of poetry. He published three volumes of sermons, "which," says his biographer, Charles Szász, Protestant bishop of Budapest, "are among the best in Hungarian literature, and will favourably compare with those of Robertson, Monod or Parker." His collected poetical works were published at Budapest in 1870, and again in 1885.

TOMPKINS, DANIEL D. (1774–1825), American politician, was born at Scarsdale, Westchester county, New York, on the 21st of June 1774. He graduated at Columbia College in 1795, and was admitted to the bar in 1797. In 1801 he was elected to the state constitutional convention, in 1803 was a member of the state assembly, and in 1804 was elected to the national House of Representatives, but became a judge of the state supreme court, and served as such until 1807. He was governor of New York in 1807–1817; and in 1817–1825, during both terms of President James Monroe, was vice-president of the United States. In March 1812, under the authority of art. xviii. of the New York constitution of 1777, he prorogued the legislature—the only instance of the exercise of this power. During the War of 1812 he was active in equipping and arming the New York militia. For this purpose he borrowed much money on his personal security, and sometimes neglected to secure proper vouchers. Later the state comptroller announced a shortage of $120,000 in the military accounts, but Tompkins claimed that the state owed him $130,000. Later investigations disclosed that the state actually owed him more than $90,000. In 1821 he was president of the state constitutional convention. He died on Staten Island, N.Y., on the 11th of June 1825.

The *Military Papers of Daniel D. Tompkins, 1807–1817* (3 vols., 1898–1902) were published by the state. See D. S. Alexander, *Political History of New York*, vol. i. (New York, 1906).

TOMPKINSVILLE, a former village of Richmond county, New York, U.S.A., since 1898 a part of the borough of Richmond, New York City. It is on the N.E. shore of Staten Island in New York Bay, about 5½ m. S. by W. of the southern extremity of Manhattan Island, and is a residential district of New York City. Tompkinsville was laid out in 1814–1815 upon a tract of about 700 acres, most of which was owned by Daniel D.

Tompkins. It was chartered as a village in 1823, but because of legal flaws the charter was revoked soon after Tompkins's death (in 1825), and thereafter the village was gradually absorbed by New Brighton and Edgewater (both incorporated in 1866), though the locality continued to be called Tompkinsville.

TOMSK, a government of western Siberia, extending from the Chinese frontier northwards to 6° N., and bounded by the government of Tobolsk on the N.W., by Yeniseisk on the N.E. and E., by north-western Mongolia on the S.E. and by the province of Semipalatinsk on the S. and W. Its area, 327,284 sq. m., is more than one and a half times that of France. The surface includes in the south-east the high alpine tracts of the Altai Mountains, and in the north-west and west the lowlands of the Irtysh and the marshy tracts of the Ob. The Altai Mountains or Sailughem system, which at their northern extremity join with the Sayan Mountains, run from north-east to south-west along the Russo-Chinese frontier, and are cleft by a deep gorge through which flows the Yenisei (see ALTAI). A zone, some 200 m. in width, of alpine tracts fringes the outer margin of these mountains, which have a very steep slope towards the north-west, although their south-eastern foot-hills rest on the plateau of Kobdo (4500 to 5000 ft.). A chain having a north-western direction—the Salair Mountains—shoots off from the main range of the Altai, between the Tom and the Chumysh; it is about 170 m. in length, with a width of nearly 60 m., and contains the most productive silver-mines of the region, as also several gold-washings. Its upheaval belongs to a more recent epoch than that of the Sailughem range, and (like the mountains of Turkestan, having a north-west direction) it is composed of dioritic rocks. In the Kuznetsk depression it is overlain by deposits of the Lower and Upper Carboniferous, containing beds of coal. The Kuznetskiy Ala-tau, one of A. von Humboldt's meridional upheavals, consists of a series of ridges running south-west to north-east.

Tomsk is drained principally by the Ob and its tributaries, but the south-east corner drains into the Abakan, a tributary of the Yenisei. The Ob, formed by the union of the Biya and Katun, has within the government a course of more than 800 m., and is navigated as far as Barnaul and Biysk. Its tributaries, the Tom (450 m.), Vasyugan (530 m.), Ket (230 m.) and Tym (200 m.), are all navigable. The Chulym and the Chumysh are also large rivers. The Bukhtarma, Om, Uba and Tara, tributaries of the Irtysh, are worthy of notice.

The climate is severe, and is, moreover, very wet in the north-west. The average yearly temperatures at Tomsk, Kainsk and Barnaul are 30·2°, 31° and 32·7° (Jan., 4°, 6·2° and 3·7°; July, 65·5°, 68·5° and 62·2°) respectively. The Altai steppes enjoy a much drier climate than the lowlands, and are clothed with beautiful vegetation; in the sheltered valleys corn is grown up to altitudes of 3400 and 4250 ft.

The population was estimated in 1906 as 2,412,700. The bulk (90%) is Russian, the remainder being Ostyaks, Mordvinians, Tatars (mostly in the Altai), Teleuts and Telenguts (Mongol tribes, chiefly in the Altai), and nomad Samoyedes, representing a mixture between the Samoyedes and the Ostyaks, and dwelling along the Ob river and its tributaries. The prevailing religion is Greek-Orthodox, but there are also some Nonconformists, Roman Catholics, Jews, Mahommedans and pagans.

Agriculture is the predominant occupation, and excellent crops are obtained in the southern portion of the government, especially in the Altai. Livestock breeding is very important, and butter-making in model dairies, partly co-operative, has developed greatly, butter being exported from Tomsk to western Europe. Trade is actively carried on at Tomsk and Barnaul, the chief centres for the trade of Siberia with Russia. The Biysk merchants carry on a barter trade with Mongolia and China.

The government is divided into six districts, the chief towns of which are Tomsk, Barnaul, Biysk, Kainsk, Kuznetsk and Marlinsk. (P. A. K.; J. T. BE.)

TOMSK, a town of Western Siberia, capital of the government of the same name, on the Tom, 27 m. above its confluence with the Ob. Pop. (1900), 63,533. Tomsk is an episcopal see and the largest city of Siberia, exceeding even Irkutsk in population and commercial importance. The great Siberian highway from Tyumen to Irkutsk passes within 54 m. (by branch railway to Taiga) of Tomsk, which is the terminus of the navigation by steamer from the Urals to Siberia. It has, moreover, communication by steamer with Barnaul and Biysk in the Altai. The town is not an administrative centre, like so many Russian cities, but an entrepôt of wares. Before 1824 it was a mere village; but after the discovery of gold in the district it grew rapidly. It is built on two terraces on the right bank of the Tom, and is divided into two parts by the Ushaika. The best building is the university. The industries are almost entirely confined to tanning and the manufacture of carriages. Tomsk has a university (founded in 1888, with 600 students), and archaeological, ethnological, zoological, botanical and mineralogical museums, a technological institute, a cathedral (finished in 1900), public libraries and scientific societies (naturalist, geographical, medical, musical, &c.). The city was founded in 1604.

TOM-TOM, or TAM-TAM, a native Indian and Asiatic word, reduplicated and onomatopoeic in form, for a drum, hence often loosely applied to the various types of primitive drum used for purposes of religious excitement, war, signalling, &c., by savage tribes throughout the world. The term is applied strictly to the metal gongs of the Far East, which are flat disks with a shallow rim.
